SOUND TRANSIT STANDARD SPECIFICATIONS

2024 EDITION
AMENDMENT 1

DISCLAIMER FOR
Design and Engineering Design Standards Documents

Sound Transit makes these documents available on an "as is" basis. By accepting receipt of the documents, the receiver agrees to the following:

- The documents are provided for information only;
- The receiver will not utilize the documents in any way that violates or infringes on Sound Transit's intellectual property rights in such documents;
- The provided documents should not be construed to represent formal design guidance and/or direction for any project;
- Sound Transit makes no representation or warranty that the provided data is complete, appropriate, or fit for any particular purpose, stated or otherwise;
- All documents provided by Sound Transit, including any revisions, shall remain the personal and intellectual property of Sound Transit; and
- To indemnify, defend, and hold harmless Sound Transit, its consultants, and agent(s) from any and all damages and claims arising from the receiver's use of these documents.

APPLICABILITY FOR
Design and Engineering Design Standards Documents

Project teams shall refer to their advertised or executed project contracts for applicable document versions/revisions.

SOUND TRANSIT STANDARD SPECIFICATIONS REVISION RECORD		
Document Title	**Date**	**Comments**
2018 Sound Transit Standard Specifications	1/15/2019	Initial Adoption
2024 Sound Transit Standard Specifications	3/29/2024	Initial Adoption

2024 ST STANDARD SPECIFICATIONS AMENDMENT RECORD			
Amendment No.	**Notice to Designer No.**	**Date**	**Comments**
1	NTD-TU-1017	10/9/24	Revision of Section 34 23 69

2024 SOUND TRANSIT STANDARD SPECIFICATIONS

FORWARD

This 2024 edition of the Sound Transit Standard Specifications has been developed to serve as the baseline for delivering and designing the projects for the public by Sound Transit. The Standard Specifications, unless otherwise stated in writing, will be incorporated into the Contract Documents, except where specifically excluded. The decision to exclude, modify or replace any standard specification is made during the design process and is subject to approval by Sound Transit.

While these specifications are to be used as a baseline during the design process, once they have been incorporated into the Contract Documents they become material and enforceable terms of that Contract. Following the completion of Issue For Bid or Issue For Construction documents, these Standard Specifications are subject to revision only through the change order process.

TABLE OF CONTENTS (WITH APPLICABILITY)

The table below denotes applicability of Sound Transit Standard Specifications to the transit systems or projects.

Section No.	Specification Title	Current Applicability					
		Light Rail	Commuter Rail	Bus Rapid Transit	URV	Garage	OMF
02 41 00	Demolition	X	X	X	X	X	X
03 05 15	Cement Concrete	X	X	X	X	X	X
03 11 00	Concrete Forming	X	X	X	X	X	X
03 15 00	Concrete Accessories	X	X	X	X	X	X
03 15 13	Waterstops	X	X	X	X	X	X
03 15 18	Elevated Guideway Expansion Joints	X	X	X	X	X	X
03 15 25	Anchorage to Concrete	X	X	X	X	X	X
03 20 00	Concrete Reinforcing	X	X	X	X	X	X
03 30 00	Cast-in-Place Concrete	X	X	X	X	X	X
03 30 13	Concrete Aerial Guideway Decking	X	X	X	X	X	X
03 30 23	Cast-in-Place Segmental Concrete Box Girder	X	X	X	X	X	X
03 35 00	Concrete Finishing	X	X	X	X	X	X
03 41 00	Precast Structures General	X	X	X	X	X	X
03 45 00	Precast Architectural Concrete	X	X			X	
03 62 00	Non-Shrink Grouting	X	X	X	X	X	X

SECTION 02 41 00

DEMOLITION

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for demolition, removal, and disposal of surface and subsurface structures, and related ancillary components.

    a. Work must include removal, relocation and disposal of all existing materials and equipment as indicated on the issued for Construction Drawings and as needed for a complete installation of all improvements. Variations must be reported to the Resident Engineer.

    b. Work must include shut-off, disconnection and removal of mechanical, plumbing, HVAC, and fire protection systems and equipment and building electrical systems from existing tunnels and buildings, including those in WSDOT facilities.

    c. Work must include rodent/pest control.

    d. Surveys must be in accordance with Migratory Bird Treaty Act (MBTA).

2. Abatement and disposal of Hazardous and Contaminated Substances must be in accordance with the Contract and local, state, and federal regulations.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. Authority Having Jurisdiction (AHJ):

    a. Standard plans and specifications.

2. American National Standards Institute (ANSI):

    a. ANSI A10.6 Safety and Health Program Requirements for Demolition Operations.

3. Washington State Department of Transportation (WSDOT):

    a. Standard Specifications for Road, Bridge, and Municipal Construction.

4. Washington Administrative Code (WAC):

    a. WAC 296-155 “Safety Standards for Construction Work”, Part S “Demolition”.

5. U.S. Fish and Wildlife Service:

    a. Migratory Bird Treaty Act (MBTA) 1918.

B. Definitions:

1. Structure: Facilities including but not limited to buildings, bridges, walls, slabs, beams, foundations, footings, piles, foundation systems, drainage structures, loading docks, stairs, and canopies.

2. Asphalt Concrete Pavements: Streets, driveways, alleyways, or other surfaces constructed from bituminous mix, or any combination of bituminous mixes or surface treatments.

3. Concrete Pavements: Streets, driveways, alleyways, or other slabs greater than six inches in thickness, constructed from Portland Cement Concrete, including those constructed with or without an asphaltic overlay.

4. Concrete Sidewalks: Concrete slabs six inches or less in thickness, with or without asphaltic overlay, also including curbs, gutters and ramps.

1.03 COORDINATION

A. Contractor must hold a preconstruction meeting to discuss the approved Construction Work Plan (CWP). The CWP must address hold points, schedule of work and related approved submittals.

B. Prior to commencing any work, Contractor must provide minimum of 30 days notice to schedule meeting(s) with Resident Engineer to discuss the work plan and schedule.

C. Contractor must obtain required permit(s) for the work from AHJ.

1.04 SUBMITTALS

A. Submit:

1. Demolition and Removal Construction Work Plan:

a. Work Plan must include the following:

1) Demolition schedule, including timing for utility disconnects and durations of parking lot or roadway and traffic impacts.

2) As-Built Drawing(s) of surveyed locations and depths of disconnected utilities, walls, and foundations left on site as required by the Contract.

3) Description and shop drawings of method and sequence of demolition and removal for all stages.

4) Description of equipment types to be used in all demolition and removal operations.

5) Description of method and equipment to be used for containment, collection, salvage, recycling, or disposal of all debris.

6) Description of haul routes and access points.

7) Location of approved disposal sites.

8) Field measurements of items and members of the existing structure prior to preparing shop drawings for concrete elements.

9) Plans and calculations for false works, prepared by a registered Professional Engineer in the State of Washington, to be used for the demolition of existing structures.

10) Temporary storage location for rail scheduled to be removed or reused as guardrail.

11) Description of cleanup and site restoration methods.

12) Survey plan coordination for Migratory Bird Treaty Act (MBTA) work and schedule as identified in this Section.

13) Plan for response, characterization, managing and disposal of Known and Unknown Hazardous or Contaminated Substances including but not limited to Hazardous Building Materials and Hazardous or Contaminated Substances associated with utilities such as asbestos cement pipe/or and sediment/sludge remaining in utility pipes, catch basins or sumps.

14) Plan to confirm Hazardous Building Material Certificate of Clearance as required by the Contract, is complete prior to beginning demolition.

2. Final Demolition Examination Report:

B. Transmit:

1. Waste Management Progress Reports.

2. Utility Severance Certificates.

3. Rodent Control Inspection and Extermination Statement:

a. After initial treatment, submit a statement signed by the pest control operator.

b. For each follow-up inspection, report the types and amount of baits placed in each location.

c. State the visible results obtained from the rodent control program.

4. Letter verifying re-establishment of survey markers and monuments, signed by a land surveyor licensed in the State of Washington.

5. Private Property Owner's Release: If material demolished and removed from the site will be deposited on private property, submit two copies of written releases to the Resident Engineer. Releases must absolve Sound Transit from responsibility concerning the depositing of material on private property, and the owners of the property must sign releases on which the material will be deposited.

1.05 QUALITY ASSURANCE

A. The issued for Construction Drawings are produced from original as-built drawings and field observations. The issued for Construction Drawings may not fully represent an accurate as-built condition. The issued for Construction Drawings of existing conditions are for Contractor’s general reference and orientation. Discrepancies may be encountered. Contractor must carefully examine and field verify all conditions, including extent of materials remaining in buildings on site. Contractor must give attention and protection to existing structures, utilities, and equipment that are to remain.

B. It is solely the Contractor's responsibility to determine demolition procedures and sequences to ensure the safety of operation. This may include the use of temporary shoring or bracing. If during demolition, damages are made to structures or utilities, Contractor must perform repair and restoration promptly at no cost to owner.

PART 2 - PRODUCTS

2.01 MATERIALS, EQUIPMENT, AND FACILITIES

A. Products for patching, extending, and matching must be the same types as those used in existing facility, and in accordance with AHJ requirements.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Prior to beginning demolition, Contractor must make a complete inspection of the project conditions, including existing visible defects. Visible defects must be photographed and logged by the Contractor and verified by the Resident Engineer.

B. Perform surveys and potholes to locate existing drainage and utilities. Contractor must prepare Construction Drawings to depict existing utilities. Protect existing utilities and drainage to remain from damage.

C. Survey for Migratory Bird Treaty Act (MBTA):

1. Submit a request to Sound Transit for survey in accordance with Migratory Bird Treaty Act (MBTA), if the construction work commences during nesting season. Nesting season may vary due to weather conditions and must be confirmed prior to any construction work commences:

a. If the construction work commences outside of nesting season, survey for Migratory Bird Treaty Act (MBTA) is not required. Contractor must verify with Sound Transit Environmental team and confirm the requirements for survey prior to commencing any construction work.

b. Request all surveys a minimum of two (2) months prior to demolition work:

1) Surveys must occur within one (1) week prior to any demolition activities and additional surveys as required by permitting agencies.

c. Sound Transit will provide written approval to commence demolition if MBTA survey is complete and does not require any additional coordination:

15) If MBTA bird species are present in the demolition area, Contractor must not commence any work until Sound Transit provides written approval to commence work.

D. Existing Structures and utilities may contain Hazardous or Contaminated Substances including asbestos, lead, PCBs, mercury, and other hazardous substances. It is the Contractor's responsibility to characterize and dispose of Hazardous or Contaminated Substances in accordance with the Contract and local, state, federal regulations.

3.02 PREPARATION

A. Rodent/Pest Control Inspection and Extermination:

1. Secure a registered sanitarian in the State of Washington to conduct a survey for evidence of current rodent/pest activity.

2. Initiate a control program by a health department certified pest control operator, if the survey indicates that it is necessary. The control program must include the following minimum requirements:

   a. At least 10 days before demolition begins, purge the work area of rodents and prevent their migration to adjacent areas. Maintain rodent-free state for three months. As directed by the Resident Engineer, execute rodent control and extermination within a one-block radius of the work area, with the permission of property owners or tenants.

   b. Place required and approved quantity of toxic bait by the pest control operator in the form of paraffinized block, in each manhole or storm drain inlet located on the same street as the facility (to be demolished), as well as at its closest intersection(s). Additional baits must be placed, as determined by the pest control operator.

   c. Where there is no competing water supply, use liquid anticoagulant baits at the discretion of the certified pesticide applicator.

   d. Inspect toxic baits and renew as necessary on the fourth or fifth day after initial baiting, and every seven days thereafter.

   e. Remove and dispose of rodent carcasses in sealed plastic bags.

   f. Submit a statement signed by the pest control operator, after the initial treatment. For each follow-up inspection, report the types and amount of baits placed in each location; state the visible results obtained from the rodent control program.

   g. Remove bait blocks upon completion of project.

B. Salvage:

1. Sound Transit will perform salvage of limited landscaping materials and building interior materials such as trim, interior doors, appliances, plumbing fixtures and light fixtures prior to Notice to Proceed for the Contract. Salvage operations must be performed under a separate contract with Sound Transit. Remove any items remaining in the buildings as part of the demolition work.

2. Remove additional salvage items that don’t impact structural integrity for salvage prior to demolition include the following:

   a. Copper.

   b. Glu-lam beams.

   c. Vertical timbers.

   d. Wood decking.

   e. Structural beams.

f. Porch columns.

g. Exterior windows.

h. Vinyl windows.

i. Exterior doors.

j. Granite.

k. Brick.

l. Elevator equipment.

C. Install temporary chain link fencing to secure all work areas, as indicated on the issued for Construction Drawings.

D. Remove trees, shrubs, and other vegetation within construction limits, except those identified to be protected in the Contract.

E. Protect trees and shrubs outside of construction limits and street trees within construction limits.

3.03 DEMOLITION OPERATIONS

A. Perform demolition in accordance with the approved Demolition and Removal Construction Work Plan. Use methods within limitations of governing regulations. Demolition must be done safely and must avoid damaging any portions of the Structure that are to remain. Observe Federal, local and state codes, including WAC 296-155 “Safety Standards for Construction Work”, Part S “Demolition”, at all times. The Contractor must review all Construction Drawings of the existing Structure noted in the Contract.

B. Exercise pollution controls as specified in the Contract.

C. Demolish and remove existing construction only to the extent required by Construction Drawings.

D. Cut demolition lines and openings true to dimensions required. Use cutting methods that minimize damage and disturbance to remaining construction. Provide temporary covers over openings.

E. Cut or drill from the exposed or finished side into concealed surfaces to avoid marring existing finished surfaces.

F. Do not use cutting torches until work area is cleared of flammable materials. Verify condition and contents within concealed spaces, such as ducts and pipes, before starting flame-cutting operations. Maintain ventilation and keep portable fire-suppression devices nearby, during flame-cutting operations.

G. Do not use explosives.

H. Perform demolition by means that protect the public, workers, and existing materials.

I. Remove and lower framing members to ground, by means to prevent free fall, ground impact, and dust generation.

J. Avoid overloading existing construction when placing demolition equipment and removing debris.

K. Completely fill abandoned pipes with Controlled Density Fill (CDF) in accordance with AHJ and manufacturer requirements. CDF must meet the requirements of WSDOT Standard Specifications for Road, Bridge and Municipal Construction.

L. Abandon catch basins, valve chambers, manholes, oil water separators, sumps, vaults, septic tanks, and inlets as shown on the plans in accordace with AHJ requirements and WSDOT Standard Spec Section 7-05.3(2).

M. When Hazardous or Contaminated Substances are encountered during demolition operations, comply with applicable regulations, laws, and ordinances concerning removal, handling, disposal, and protection against exposure to environmental pollution.

3.04 REMOVAL

A. Except for items or materials indicated in the Waste Management Plan to be reused, salvaged, recycled, reinstalled, or otherwise indicated to remain Sound Transit's property, Contractor must remove and transport demolished materials from Work site and legally dispose:

1. Do not allow demolished materials, including those to be salvaged, recycled, or disposed to accumulate on site. Remove materials from building and work site regularly, so their presence will not create unsafe conditions for workers and the public.

2. Comply with AHJ requirements regarding handling, removal, hauling, and disposal of materials.

3. Prevent spillage during removal and transporting of materials.

4. Do not burn or bury materials.

B. Except for items indicated for salvage or reuse, material removed become the Contractor’s property and must be removed from the Site before completion of project.

3.05 RESTORATION

A. When non-scheduled items are demolished or removed, replace items as directed by the Resident Engineer.

B. Repair and restore damaged facilities, caused by demolition and operation, to their original conditions or better.

C. Backfill and level depressions caused by demolition and operation. Grade ground surface as indicated on the issued for Construction Drawings and eliminate water pockets.

D. Remove temporary chain link fencing, barriers, and safety guards upon completion of work.

3.06 FIELD QUALITY CONTROL

A. At completion of demolition, the Contractor must make examination of exposed components and possible damage caused by demolition work. Submit Final Examination report to the Resident Engineer for approval.

3.07 CLEANING

A. Maintain a clean and orderly work site.

B. Clean adjacent facilities; remove dust, dirt, and debris caused by demolition operations. Return adjacent facilities to previously existing or better condition, prior to demolition operations.

3.08 PROTECTION

A. Protect remaining work and adjacent facilities from damage. Do not interfere with neighboring buildings, facilities, or activities.

B. Provide bracing and shoring to maintain the stability of existing facilities and construction.

C. Provide barriers, safety guards, and warning lights near openings and depressions. Operate warning lights from dusk to dawn daily.

D. Provide environmental protection as required by the Contract and local, state and federal regulations to prevent refuse, dust and waste from entering waterways, air or utility drains.

E. Preservation of Reference Markers:

1. Record the locations and designation of survey markers and monuments, prior to their removal. Provide three reference points for each survey marker and monument removed. Establish reference points by a land surveyor licensed in the State of Washington.

2. Store and protect removed markers and monuments during demolition work. Replace and re-establish survey markers and monuments in conformance with the recorded reference points, upon completion of work.

F. Protection of Utilities:

1. Protect utilities from damage caused by settlement, lateral movement, undermining, washout, and other hazards created by the demolition operations.

2. Arrange for and verify temporary termination of utility services encountered and as indicated on issued for Construction Drawings, in conformance with AHJ.

3. If utility is damaged, immediately notify the Resident Engineer and the utility owner for corrective action.

END OF SECTION

SECTION 03 05 15

CEMENT CONCRETE

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for materials, proportioning, production, and delivery of Portland cement or hydraulic cement concrete.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. American Association of State Highway and Transportation Officials (AASHTO).

a. AASHTO LRFD Bridge Design Specifications.

b. AASHTO M 240M/ M 240 Standard Specification for Blended Hydraulic Cement.

2. American Concrete Institute (ACI):

a. ACI 121R Guide for Concrete Construction Systems Quality in Conformance with ISO 9001.

b. ACI 211.1 Standard Practice for Selecting Proportions for Normal, Heavyweight, and Mass Concrete.

c. ACI 301 Specifications for Structural Concrete.

d. ACI 304R Guide for Measuring, Mixing, Transporting, and Placing Concrete.

e. ACI 304.2R Guide to Placing Concrete by Pumping Methods.

f. ACI 305R Guide to Hot Weather Concreting.

g. ACI 318 Building Code Requirements for Structural Concrete and Commentary.

h. ACI SPEC-306.1 Standard Specification for Cold Weather Concreting.

i. ACI CODE-318 Building Code Requirements for Structural Concrete and Commentary.

3. American Society for Testing and Materials (ASTM) International:

a. ASTM C33/C33M Standard Specification for Concrete Aggregates.

b. ASTM C40/C40M Standard Test Method for Organic Impurities in Fine Aggregates for Concrete.

c. ASTM C88/C88M Standard Test Method for Soundness of Aggregates by Use of Sodium Sulfate or Magnesium Sulfate.

d. ASTM C94/C94M Standard Specification for Ready-Mixed Concrete.

e. ASTM C114 Standard Test Methods for Chemical Analysis of Hydraulic Cement.

f. ASTM C127 Standard Test Method for Density, Relative Density (Specific Gravity), and Absorption of Coarse Aggregate.

g. ASTM C128 Standard Test Method for Density, Relative Density (Specific Gravity), and Absorption of Fine Aggregate.

h. ASTM C131/C131M Standard Test Method for Resistance to Degradation of Small-Size Coarse Aggregate by Abrasion and Impact in the Los Angeles Machine.

i. ASTM C136/C136M Standard Test Method for Sieve Analysis of Fine and Coarse Aggregates.

j. ASTM C150/C150M Standard Specification for Portland Cement.

k. ASTM C157 Standard Test Method for Length Change of Hardened Hydraulic-Cement Mortar and Concrete.

l. ASTM C227 Standard Test Method for Potential Alkali Reactivity of Cement-Aggregate Combinations (Mortar-Bar Method).

m. ASTM C260/C260M Standard Specification for Air-Entraining Admixtures for Concrete.

n. ASTM C289 Standard Test Method for Potential Alkali-Silica Reactivity of Aggregates (Chemical Method).

o. ASTM C494/C494M Standard Specification for Chemical Admixtures for Concrete.

p. ASTM C535 Standard Test Method for Resistance to Degradation of Large-Size Coarse Aggregate by Abrasion and Impact in the Los Angeles Machine.

q. ASTM C595/C595M Standard Specification for Blended Hydraulic Cements.

r. ASTM C618 Standard Specification for Coal Fly Ash and Raw or Calcined Natural Pozzolan for Use in Concrete.

s. ASTM C989/C989M Standard Specification for Slag Cement for Use in Concrete and Mortars.

t. ASTM C1012 Standard Test Method for Length Change of Hydraulic-Cement Mortars Exposed to a Sulfate Solution.

u. ASTM C1017/C1017M Standard Specification for Chemical Admixtures for Use in Producing Flowing Concrete.

v. ASTM C1116/C1116M Standard Specification for Fiber-Reinforced Concrete.

w. ASTM C1240 Standard Specification for Silica Fume Used in Cementitious Mixtures.

x. ASTM C1602/C1602M Standard Specification for Mixing Water Used in the Production of Hydraulic Cement Concrete.

y. ASTM E329 Standard Specification for Agencies Engaged in Construction Inspection, Testing, or Special Inspection.

4. National Ready Mixed Concrete Association (NRMCA):

a. NRMCA Quality Control Manual, Section 3: Plant Certification Checklist.

5. Washington State Department of Transportation (WSDOT):

a. WSDOT Standard Specifications for Road, Bridge and Municipal Construction (WSDOT Standard Specification).

6. BS EN 12390-8 Testing Hardened Concrete Depth of Penetration of Water Under Pressure.

B. Definitions:

1. Concrete Mix: Preparations of mix and proportions of cement, water, aggregates, air, and supplementary materials required for a required strength and durability are as shown on the Issued for Construction Documents. Each mix is designated to have one or more uses. Furnish a separate mix design for each concrete mix.

2. Mass Concrete: Section 03 30 00 - Cast-In-Place Concrete.

3. Supplementary Cementitious Materials: Fly Ash, Slag, and Silica Fume.

4. Total Cementitious Materials: The amount of Portland cement plus the amount of all supplementary cementitious materials.

5. Water Cement (W/CM) Ratio: The ratio of water to total cementitious materials by weight.

1.03 SUBMITTALS

A. Submit:

1. Concrete Mix Designs: For each concrete mix submit a concrete mix design. Include the following as a minimum:

a. Supplier, mix design number, and plant location.

b. Proposed use and locations.

c. Mix constituents, including:

1) Cement: Supplier, source, type, and specific gravity.

2) Supplementary Cementitious Materials: Supplier; source; type, class or grade; and specific gravity.

3) Coarse Aggregate: Supplier, source, grading, type, and specific gravity.

4) Fine Aggregate: Supplier, source, grading, type, and specific gravity.

5) Admixtures: Manufacturer, product, and type.

6) Micro synthetic, macro synthetic, and steel fibers

7) Water: Source of supply.

d. Mix constituent proportions per cubic yard, including weight or dose and absolute volume.

e. Mix constituent ratios, including water to total cementitious material ratio by weight and Supplemental cementitious material to total cementitious material ratio by weight.

f. Concrete mix properties, including:

1) 28-day or 56-day compressive strength, as applicable.

2) Unit weight.

3) Slump.

4) Percent entrained air.

g. Statistical analysis determining the required average compressive strength in conformance with ACI 301.

h. Documentation of average compressive strength in conformance with ACI 301:

1) If field test data are used, all data must be supported by an Independent Testing Laboratory's report.

2. Sample Test and Analysis reports listed under Source Quality Control

3. Concrete Quality Program Plan: Conform to Issued for Construction Documents, including truck-mixing plan.

B. Transmit

1. Placement records describing concrete mix design, delivery, and placement information.

2. Concrete Inspection Records

3. Admixtures:

a. For each admixture, transmit the following:

b. Manufacturer's product data showing conformance.

1) Manufacturer's published instructions for storage, handling, and use.

2) Material Safety and Data Sheets.

3) Manufacturer's certification that admixture is compatible with all other admixtures used in the mix design.

4) Water based Hydrophobic admixture manufacturer's standard warranty.

4. Micro synthetic, macro synthetic, and steel fibers:

   a. Manufacturer's product data showing conformance.

   b. Manufacturer's published instructions for storage, handling, and use.

   c. Material Safety and Data Sheets.

5. Material Certification:

   a. For each material, submit supplier's certification that the materials conform to the requirements of this Section.

6. Qualifications:

   a. Concrete supplier.

7. Concrete Mix Environmental Product Declaration (EPD) Calculation:

   a. For a minimum of 90 percent by volume of the cast-in-place concrete mix designs, transmit Environmental Product Declarations in accordance with The Carbon Leadership Forum Product Category Rules (PCR) for ISO 14025 Type III Environmental Product Declarations (EPDs) for Concrete. The information to be based on the pour logs. Transmit updated reports at least at approximately 25 percent, 50 percent, 75 percent and 100 percent of the total volume of the cast-in-place concrete to be used in the project.

   b. Calculate the NRMCA Pacific Northwest Region Benchmark Average Global Warming Potential (GWP) for the volume of concrete with EPDs and use the latest version of ST Lower Carbon Concrete Tracker spreadsheet to report EPD calculation. The calculation must include:

      1) A list of all classes of concrete used in the project. A class of concrete is determined by the 28-day compressive strength (i.e. 3000 psi concrete, 4000 psi concrete and etc.).

      2) A list of the projected volume of each class of concrete used in the project. The total volume reported must match the total volume of concrete listed in the Mix Design average GWP calculations.

      3) A list of the GWP for each class of concrete for the Pacific Northwest Region as reported in the NRMCA Member National and Regional Life Cycle Assessment Benchmark (Industry Average) Report, dated October 2014. These regional averages are as follows:

Indicator / LCI Metric Unit (equivalent)		Global Warming Potential (GWP) kg CO2
2500 psi Concrete	per yd^3	199.92
3000 psi Concrete	per yd3	222.58
4000 psi Concrete	per yd3	272.33
5000 psi Concrete	per yd3	336.67
6000 psi Concrete	per yd3	354.66
8000 psi Concrete	per yd3	432.99

NOTES - Regional Averages of GWP (from list above)

a) Interpolation is permitted to determine GWP values for concrete classes between the values shown in the table.

b) Where a concrete class has a lower 28-day strength than 2500 psi, use the following equations to determine the Benchmark GWP:

c) GWP = 199.92 - [2500 psi - 28-day strength (psi)] x 0.045 per yd3

d) Where a concrete class has a higher 28-day strength than 8000 psi, use the following equations to determine the Benchmark GWP:

e) GWP = 432.99 + (28-day strength (psi) – 8000 psi) x 0.039 per yd3

4) Calculate the weighted average NRMCA Pacific Northwest Region Benchmark GWP for the volume of concrete corresponding to the Mix Designs with EPDs as follows:

$$GWP_{AVG} = \frac{\sum_{i=1}^{n}[GWP_i \times Volume_i]}{\sum_{i=1}^{n} Volume_i}$$

Where:

GWP_i = global warming potential for concrete class i.

$Volume_i$ = projected volume of concrete for concrete class i.

n = total number of classes of concrete.

c. Calculate the weighted average Mix Design GWP for the volume of concrete with EPDs. The calculation must include:

1) A list of all mixes used on the project. This list includes the supplier, mix design number, supply plant location, EPD Program Operator, EPD Developer, EPD issue date, and EPD expiration date for every mix.

2) A list of the projected volume of each mix used on the project. The total volume reported matches the total volume of concrete listed in the NRMCA Pacific Northwest Region Benchmark average GWP calculations.

3) A list of GWP, as shown on the mix's EPD, for each mix.

4) Calculate the Mix Design average GWP as follows:

$$GWP_{AVG} = \frac{\sum_{i=1}^{n}[GWP_i \times Volume_i]}{\sum_{i=1}^{n} Volume_i}$$

Where:

GWP_i = global warming potential for mix i.

$Volume_i$ = projected volume of concrete for mix i.

n = total number of mixes of concrete.

d. Calculate the percent reduction in Mix Design average GWP as compared to the NRMCA Pacific Northwest Region Benchmark average GWP.

1.04 QUALITY ASSURANCE

A. Concrete Supplier: Select a concrete supplier holding a current Certificate of Conformance for Concrete Production Facilities from the National Ready Mix Concrete Association.

B. Concrete Quality Program Plan: Develop a Quality Program Plan in conformance with ACI 121R.

C. Independent Inspection and Testing Laboratory: In conformance with ASTM E329.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Cementitious Materials: Store in dry, weather-tight buildings, bins, or silos that exclude contaminants.

B. Coarse and Fine Aggregates: Store to prevent segregation and contamination from other materials or other gradations or types of aggregate. Store to drain freely. Do not use frozen aggregate.

C. Admixtures: Store and handle in conformance with manufacturer’s published instructions.

D. Micro synthetic, macro synthetic and steel fibers: Store and handle in conformance with manufacturer’s published instructions.

E. Water: Protect from contamination.

PART 2 - PRODUCTS

2.01 LEED COMPLIANCE

A. Refer to Article 1.03.B.5, herein.

2.02 MATERIALS

A. General: For each material:

1. Use only one source in each mix design.

2. If source changes, submit a revised mix design using the product from the new source.

3. Do not change source for an approved mix design without written approval by Resident Engineer.

B. Cementitious Materials:

1. Portland Cement: ASTM C150/ C150M.

2. High early strength cements must not be used in mass concrete.

3. Portland Limestone Cement: ASTM C595

   a. Do not use Type 1L in post tensioned and pre-stressed concrete elements that are designed, in whole or in part, to constitute the permanent function of the works.

   b. Type 1L used in the concrete under sulfate exposure include, but are not limited to, the concrete in contact with soil, marine environment and brackish water. Determine the sulfate resistance requirement in accordance with ACI 318 Table 19.3.2.1 Requirements to Concrete by Exposure Class, and meet the corresponding physical requirements in ASTM C595/C595M using the testing method in ASTM C1012.

   c. Type 1L concrete durability must be comparable to Type I/II concrete.

   d. Only the Type 1L cement manufactured by the manufacturers on the WSDOT QPL are acceptable to be used in the concrete mix designs.

4. Supplementary Cementitious Materials:

   a. Fly-ash: ASTM C618, Class C or F except for Mass Concrete. Fly ash must be Class F is used in Mass Concrete.

   b. Ground Granulated Blast-Furnace (GGBF) Slag: ASTM C989/C989M.

   c. Silica Fume: ASTM C1240.

C. Coarse Aggregate:

1. Hard, strong, durable gravel or crushed stone conforming to ASTM C33/C33M.

2. Grading:

   a. WSDOT Standard Specifications Section 9-03.1(4)C.

3. Use only aggregate that is innocuous with work.

4. Meet the following requirements when tested in conformance with the specified test methods:

a. Resistance to Abrasion (ASTM C131/C131M): For the loss for aggregate size range 3/4-inch to 3/16-inch after 100 revolutions and 500 revolutions do not exceed 10 percent and 35 percent, respectively. Include within the test sample seven parts of Grading B and three parts of Grading C.

b. Resistance to Abrasion (ASTM C535): For the loss for aggregate size range 1-1/2 inches to 3/4 inch (Grading 3) after 200 revolutions and 1,000 revolutions do not exceed 10 percent and 35 percent, respectively.

c. Soundness (ASTM C88/C88M): Weighted average loss after 5 cycles not to exceed 10 percent when tested with sodium sulfate.

d. Bulk Specific Gravity (ASTM C127): On the basis of saturated surface-dry aggregate not less than 2.60.

e. Absorption (ASTM C127): Not to exceed 3 percent.

f. Potential Reactivity (ASTM C289): Only use aggregates that are not harmful for Cement-Aggregate Alkali reactivity.

g. Potential Reactivity (ASTM C227): Only use aggregates that are not harmful for Cement-Aggregate Alkali reactivity.

D. Fine Aggregate:

1. Hard, strong, durable stone or rock fragments conforming to ASTM C33/C33M, except as modified in this specification.

2. Grading:

   a. WSDOT Standard Specifications 2020 Section 9-03.1(2)B.

3. Use only aggregate that is innocuous with work.

4. Meet the following requirements when tested in conformance with the specified test methods:

   a. Soundness (ASTM C88/C88M): Weighted average loss after 5 cycles not to exceed 10 percent when tested with sodium sulfate.

   b. Bulk Specific Gravity (ASTM C128): On the basis of saturated surface-dry aggregate not less than 2.60.

   c. Organic Impurities (ASTM C40/C40M): Supernatant liquid lighter in color than the reference standard color solution.

   d. Fineness Modulus (ASTM C33/C33M): In the range of 2.80 to 3.50; for the fine aggregate not to vary more than plus or minus 0.20 from the fineness modulus of the fine aggregates used in the concrete mix design.

   e. Absorption (ASTM C128): Not to exceed three percent.

   f. Potential Reactivity (ASTM C289): Only use aggregates that are not harmful for Cement-Aggregate Alkali reactivity.

   g. Potential Reactivity (ASTM C227): Only use aggregates that are not harmful for Cement-Aggregate Alkali reactivity.

E. Admixtures:

1. General:

a. Do not use admixtures containing chlorides, sulfides, or nitrides.

b. Provide admixtures compatible with all other admixtures used in the concrete mix.

2. Air-Entraining: ASTM C260/C260M.

3. Chemical Admixtures:

a. Water-Reducing: ASTM C494/C494M, Type A.

b. High Range, Water Reducing: ASTM C494/C494M, Type F.

c. Plasticizing and Retarding: ASTM C1017/C1017M, Type II.

d. Shrinkage Reducing: ASTM C494, Type S.

e. Retarding: ASTM C494, Type B and D for use in Mass Concrete if required.

4. Shrinkage Reducing Admixtures: mitigate shrinkage with the use of a shrinkage reducing admixture (SRA) in air-entrained concrete for plinth concrete supporting steel tracks:

a. Provide a minimum of two samples of the concrete mix design with the SRA to evidence a maximum shrinkage of 0.02 percent at 28-days when testing per ASTM C157 with the following modifications:

1) Initial measurement must be at 24-hours after casting.

2) Terminate moist curing after a maximum of 7 days after casting.

b. Shrinkage Reducing: ASTM C494, Type S.

c. Manufacturer and products to have demonstrated experience on projects of similar size and complexity for a minimum of 5 years.

5. Water-Based Hydrophobic Admixtures: use in the concrete for top level floors and top-level ramps of parking garages. Also provide at below grade walls and floors forming elevator and escalator pits, below grade shaft walls, or other locations where shown on the Issued for Construction Documents. Product: Hycrete W1000 or approved equal:

a. Meet admixture guidelines for permeability reducing admixtures suitable for hydrostatic (PRAH) and non-hydrostatic (PRAN) service conditions per ACI 212 chapter 15 “Report on Chemical Admixtures”.

b. The concrete mix must not use the admixture that contains Portland cement, sodium silicate, potassium silicate, flyash, silica fume, ground-granulated blast furnace slag, fillers, or other mineral type cementitious constituents.

c. Meet 50 percent or greater in sorptivity compared to control at seven days according to ASTM C1585.

d. Admixture must demonstrate sulfate expansion resistance in concrete with 0.45 water/cement ratio of less than 0.05 percent expansion at 18 months per ASTM C1012.

e. Admixture must demonstrate 50 percent or greater reduction in depth of water penetration under pressure at least 30 days compared to control in concrete per BS EN 12390-8.

f. Mix designs including admixture must be in accordance with admixture manufacturer instructions.

g. Manufacturer and products must demonstrate experience on projects of similar size and complexity for a minimum of 5 years.

h. Manufacturer or vendor must review and approve waterproofing details and procedures, including detailing of joints, waterstops, reinforcing steel, and service penetrations.

i. Manufacturer or vendor must provide pre-placement and placement inspection of waterstop installation, concrete placement, and document specification compliance.

j. Provide waterstops in construction joints as required by Additive Manufacturer. Refer to Section 03 15 13 – Waterstops.

F. Micro synthetic, macro synthetic, and steel fibers: Complying with ASTM C1116/C1116M.

G. Water: ASTM C1602/C1602M.

2.03 MIX DESIGNS

A. Obtain concrete mix designs from a qualified Independent Inspection Laboratory or concrete supplier properly equipped to design concrete mixes.

B. Select mix proportions in conformance with ACI 211.1.

C. Design concrete mixes intended for pumping in conformance with the specifications of ACI 304R and ACI 304.2R.

D. For trial batch, sample and test concrete in conformance with Section 03 30 00 - Cast-In-Place Concrete.

E. Durability: materials and proportions of material for each concrete mix including but not limited to air content, cementitious materials, and chemical content must conform to:

1. Building and Station structures: ACI318 Building Code Requirements for Structural Concrete – Chapters 19 and 20, and Issued for Construction Documents.

2. Elevated Guideway structures: AASHTO LRFD Bridge Design Specifications – Concrete Structures – Durability and Issued for Construction Documents.:

F. Establish proportions of materials for each concrete mix to:

1. Provide workability and consistency to permit concrete to be worked readily into forms and around reinforcement under conditions of placement to be employed, without segregation or bleeding.

2. Meet the strength and applicable exposure requirements as shown on Issued for Construction Documents.

G. Aggregate Size: Nominal size of coarse aggregate must not be larger than the least of:

1. 1/5 the narrowest dimension between the sides of the forms.

2. 1/3 the depth of slabs.

3. 3/4 the minimum clear spacing between individual reinforcing bars, wires, or bundles of bars.

H. Slump: Establish consistency of concrete to facilitate placement with minimized potential for segregation.

I. Shrinkage limit at 28 days measured in accordance with ASTM C157 where required by the Contact Documents or ST Technical Design Requirements.

2.04 SOURCE QUALITY CONTROL

A. Sample Tests and Analyses: Test cement, coarse aggregate and fine aggregate to demonstrate conformance with the following requirements:

1. Portland Cement: ASTM C114.

2. Portland Limestone Cement: ASTM C1012.

3. Aggregates:

a. Grading and quality: See Article 2.02 Materials of this section.

b. Sieve analysis: ASTM C136/C136M.

PART 3 - EXECUTION

3.01 PREPARATION

A. Measure, batch, and mix Portland cement concrete in conformance with ASTM C94/C94M:

1. Use central-mixed concrete transported to the jobsite in truck mixers.

2. Use truck mixers equipped with:

a. Automatic device for recording the number of drum revolutions prior to complete of mixing operations.

b. Either accurately calibrated water tanks or water meters.

3.02 DELIVERY

A. Delivery and conveying of concrete conformance with ACI 301 and ACI 304R.

B. Transport and deliver concrete in conformance with ASTM C94/C94M and furnish batch ticket information:

1. Batch tickets: include the amount of water in the batch from the plant and the remaining water that is to be added at the site, if any.

C. Mix concrete continuously in truck mixer until discharged.

D. Mix ready-mixed concrete for a period of not less than 10 minutes. Mix for at least 3 minutes immediately prior to discharging at the site.

E. Do not place concrete more than 90 minutes or 300 drum revolutions after introduction of the mixing water, whichever is less.

3.03 ADJUSTING

A. If concrete arrives at the site with a slump less than is workable for the given mix design, adjust the slump by adding water at the site with the following restrictions:

1. Water added at the site was withheld from the batch water at the plant.

2. The total water added at the plant and the site does not exceed the mix design water amount.

3. Water is added at the site in conformance with ASTM C94.

4. Do not add water to the concrete after water reducing admixtures are added at the site.

5. Do not add water to the concrete after partial discharge of the load.

B. Retest slump, temperature, and air content after slump adjustment in conformance with Section 03 30 00 - Cast-In-Place Concrete.

C. If concrete arrives at the site with a slump greater than acceptable, perform a check test immediately on a new test sample. In the event the check test fails, the Resident Engineer will consider the concrete to have failed the requirements and rejected it.

3.04 WEATHER RELATED PLACEMENT

A. Refer to Section 03 30 00 - Cast-In-Place Concrete

END OF SECTION

SECTION 03 11 00

CONCRETE FORMING

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for the design, construction, and treatment of formwork for cast-in- place concrete construction.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. American Concrete Institute (ACI):

a. ACI 116R Cement and Concrete Terminology.

b. ACI 117 Specification for Tolerances for Concrete Construction and Materials and Commentary.

c. ACI 301 Specifications for Structural Concrete.

d. ACI 347R Guide to Formwork for Concrete.

2. APA-The Engineered Wood Association (APA):

a. APA PS 1 Standard for Structural Plywood.

b. APA Concrete Forming Design/Construction Guide.

3. American Society for Testing and Materials (ASTM) International:

a. ASTM D994/D994M Standard Specification for Preformed Expansion Joint Filler for Concrete (Bituminous Type).

b. ASTM D1751 Standard Specification for Preformed Expansion Joint Filler for Concrete Paving and Structural Construction (Nonextruding and Resilient Bituminous Types).

c. ASTM D4397 Standard Specification for Polyethylene Sheeting for Construction, Industrial, and Agricultural Applications.

4. Federal Specifications (FED):

a. FED TT-S-1543B Sealing Compound, Silicone Rubber Base (For Caulking, Sealing, and Glazing in Buildings and Other Structures).

5. Pacific Lumber Inspection Bureau (PLIB)

a. WCLB Standard Grading Rules for West Coast & Imported Softwood Lumber.

6. Washington State Department of Transportation (WSDOT):

a. WSDOT Standard Specifications for Road, Bridge and Municipal Construction (WSDOT Standard Specification).

B. Definitions:

1. Roughened: Concrete intentionally roughened to a full amplitude of approximately 1/4 inch.

2. With the above exception, the words and terms used in this Section conform to the definitions given in ACI 116R.

1.03 SUBMITTALS

A. Submit

1. Shop Drawings:

a. Overall geometry of formwork, shoring, reshoring, and backshoring.

b. Locations and details of:

1) Expansion joints and construction joints.

2) Maximum lift height, maximum pour length, maximum pour rate.

3) Formed concrete items such as keys, blockouts, and openings.

4) Embedded items such as metal fabrications, waterstops, and conduit.

5) Form ties (if used). Layout of form ties to reinforce the architectural design. Use Hole Plugs per specification.

6) Control Joints to control and direct shrinkage cracking. Submit joint plan for approval prior to pouring slabs and walls.

7) Corner chamfers.

2. Procedures for:

a. Erecting formwork and shoring.

b. Monitoring formwork movement during concrete placement.

c. Determining strength of concrete for removal of formwork if other than field-cured cylinders.

d. Removing formwork, reshoring, and backshoring.

3. Calculations, sealed by a Professional Engineer licensed in the State of Washington. Include complete calculations with working drawings describing the formwork, shoring, geometry, details, and procedures.

4. Formwork Construction Work Plan. Construction Work Plan must include complete details, drawings, a step-by-step procedure, and must provide the anticipated time for each construction activity.

5. Construction work plan for work over traffic:

a. Construction Work Plan for work over traffic must include the proposed work schedule, durations, night activities, activities over traffic, precautions for work performed over traffic, and any sidewalk, lane, shoulder, or roadway closures needed to perform the work. The Work Plan must also include the drainage plan.

b. Complete details of the catchment structure for protection of traffic. The catchment structure details must include horizontal and vertical clearances to sidewalks or roadways open to traffic during construction of each cast-in-place element.

B. Transmit

1. Samples:

a. Formwork facing materials: One sample for each type used, minimum of 12 inches by 12 inches or large enough to demonstrate conformance with the required formed pattern.

2. Manufactured Products:

a. For formliners:

1) Manufacturer's Product Data to demonstrate conformance.

2) Manufacturer's written instructions for storage, handling, and installation.

3. Qualifications for Professional Engineer.

1.04 QUALITY ASSURANCE

A. Professional Engineer: Select a licensed professional engineer currently registered in the State of Washington with minimum 5-year experience in this type of design.

B. Provide the submitted/approved formwork calculations sealed by the transmitted Qualified Professional Engineer.

1.05 DELIVERY, STORAGE AND HANDLING

A. Store and handle form facing materials to prevent distortion, damage, and contamination that could adversely affect the concrete finish.

B. Store and handle manufactured products in conformance with manufacturer's written instructions.

1.06 PROJECT CONDITIONS

A. Allow sufficient time between erection of forms and placing of concrete for the various trades to properly install concrete reinforcement, embedded items, sleeves, and blockouts.

B. Do not apply lateral or vertical superimposed loads to structure until concrete has developed specified compressive strength.

PART 2 - PRODUCTS

2.01 DESIGN REQUIREMENTS

A. Design and installation of formwork must conform to ACI 301.

B. Design and installation of falsework and formwork on WSDOT facilities must conform to WSDOT Standard Specifications Section 6-02.3(17) Falsework and Formwork.

C. Loads due to operations on WSDOT facilities or loads influencing WSDOT foundations must conform to WSDOT Standard Specifications Section 1.07.7 Load Limits.

D. Design plywood for formwork in accordance with the APA Design/Construction Guide: Concrete Forming.

E. Design formwork, shores, reshores, and backshores in conformance with ACI 347R.

F. Design formwork and shores to resist pressure resulting from concrete placement and maintain tolerances during placement and vibration of concrete.

G. Design formwork to be removed without damage to adjacent concrete surfaces or materials.

H. For post-tensioned structures, design the formwork to carry the additional loads caused by the post-tensioning operations.

I. Do not use earth cuts as forms for vertical or sloping surfaces unless indicated on the Issued for Construction Documents.

J. Tolerances: Design and construct formwork to produce finished concrete surfaces within the following tolerances:

1. Deflection of Facing Material from dead load and concrete fluid pressure:

a. Unexposed non-visible surfaces, including the bottom of deck slab between girders: L/270.

b. Exposed visible surfaces: L/360.

2. Vertical Alignment:

a. Lines, surfaces, and arises: 1 inch.

b. Outside corner of exposed corner columns and control joint grooves in concrete exposed to view: 1/2 inch.

3. Vertical Alignment at Track Plinth Locations

a. Elevations of slabs in tunnels and slabs on grade: +1/2 inch to -1 inch.

b. Elevation of bridge deck surfaces: +1/2 inch to -1 – 1/2 inch.

4. Lateral Alignment:

a. Members: 1 inch.

b. In slabs, centerline location of openings 12 inches or smaller and edge locations of larger openings: 1/2 inch.

c. Sawcuts, joints, and weakened plane embedments in slabs: 3/4 inch.

5. Level Alignment:

a. Tops of slabs:

1) Elevation of slabs on grade: 3/4 inch.

2) Elevation of top surfaces of formed slabs before removal of supporting shores: 3/4 inch.

3) Slabs that receive thin-set tile, or resilient flooring must have a flatness rating of 35 and levelness rating of 25 per ACI 117.

4) Slabs that receive carpet must have a flatness rating of 25 and levelness rating of 20 per ACI 117.

b. Elevation of formed surfaces before removal of shores: 3/4 inch.

c. Lintels, sills, parapets, horizontal grooves, and other lines exposed to view: 1/4 inch.

6. Cross-sectional Dimensions:

a. Members, such as columns, beams, piers, walls (thickness only), and slabs (thickness only).

1) Dimension 12 inch or less: plus 3/8-inch, minus 1/4 inch.

2) Dimension more than 12 inch but less than 3 feet: plus 1/2-inch, minus 3/8 inch.

3) Dimension over 3 feet: plus 1-inch, minus 3/4 inch.

7. Relative Alignment:

a. Stairs:

1) Difference in height between adjacent risers: plus, or minus 1/8 inch.

2) Difference in width between adjacent treads: plus, or minus 1/4 inch.

b. Grooves:

1) Specified width 2 inches or less: plus, or minus 1/8 inch.

2) Specified with more than 2 inches but less than 12 inches: plus, or minus 1/4 inch.

c. Formed surfaces slope with respect to the specified plane must not exceed the rate of 3/8 inch per 10 feet.

8. The offset between formed surface irregularities must not exceed:

a. Surfaces exposed to public view: ACI 117 Class A surface, 1/8 inch.

b. Other surfaces: ACI 117 Class C surface, 1/2 inch.

c. See Section 03 35 00 - Concrete Finishing for additional requirements.

9. In locations where more than one tolerance applies, use the stringent tolerance.

2.02 FORM FACING MATERIALS

A. Rough Form Finish

1. Boards: Use dressed side of lumber for surface in contact with the concrete and use dressed or tongue-and-groove edges.

2. Framing Lumber: Structural grade, dressed or rough. Warped or wet lumber is not permitted.

B. Smooth Form Finish:

1. Types:

a. B-B Plyform: Class I, EXT-APA, sanded, APA trademarked and conforming to APA PS 1.

b. B-C Plyform: Class I, EXT-APA, APA trademarked and conforming to APA PS 1.

c. High Density Overlay (HDO) Plyform: A-A, 60-60, Class I, EXT-APA, APA trademarked and conforming to APA PS 1.

2. Thickness: As required to maintain surface smoothness without deflection, but not thinner than 5/8 inch.

3. Finish Tolerance: ACI 117, and paragraph 2.01.J.7.

2.03 PRODUCTS

A. Steel Forms:

1. Proprietary, patented, or fabricated steel forms, using standard commercial quality, uncoated steel sheet or plate, 3/16-inch minimum thickness, for panel facings. Include panel framing, reinforcement, and erection accessories.

B. Round Column Forms:

1. Pressed or molded fiber-reinforced plastic, manufactured round column forms, seamless or one-piece (one vertical seam), smooth surface, of sizes indicated.

2. See Section 03 33 00 - Concrete Finishing

C. Formwork Accessories

1. Form Ties: Rod type with end fasteners which can be removed without spalling the concrete. Provide cones with setbacks equal to the required concrete cover. Form ties are not allowed for single-sided formed walls requiring waterproofing.

2. Form Tie Hole Plugs: Preformed mortar plugs to match the color of the concrete, recessed 1/4 inch. Adhere with a manufacturer approved epoxy adhesive.

3. Chamfer Strips: Fillet milled from clear, straight-grain pine, surfaced each side; or extruded vinyl type with or without nailing flange.

4. Polyethylene Sheeting: Single ply 6-mil polyethylene sheeting conforming to ASTM D4397. Provide a compatible tape with equal or better water vapor control characteristics than sheeting.

D. Form Release Agent:

1. Commercial formulation, silicone-free, designed for use on all form facing materials used, which will not:

a. Bond with, stain, or adversely affect concrete surfaces.

b. Impair subsequent treatment of concrete surfaces requiring bond or adhesion.

c. Impede wetting of surfaces which will be cured with water, steam, or curing compounds.

E. Joint and Seam Sealer: Capable of producing flush, watertight, and nonabsorbent surfaces and joints, and compatible with forming material and concrete ingredients:

1. Sealant Compound: Silicone sealant conforming to Federal Specification TT-S-001543A (CON-NBS).

2. Form Film Tape: Polypropylene plastic treated with waterproof adhesive for joint conditions not exposed to public view.

F. Premolded Joint Filler: ASTM D994/D994M or ASTMD1751.

G. Limit the products to what are listed above. Do not use metal lath forms (stayforms).

2.04 ACCESSORIES

A. Provide openings, offsets, sinkages, keyways, recesses, molding, rustications strips, chamfers, blocking, screed bulkheads, anchorages, embedded items, and other features.

PART 3 - EXECUTION

3.01 PREPARATION

A. Locate and stake out all forms, inserts, conduits, blockouts, and obstructions. Establish all lines, levels, and elevations. Include all checks into the pre-pour checklist.

3.02 CONSTRUCTION

A. General:

1. Construct formwork in conformance with the approved Shop Drawings to produce finished concrete surfaces as indicated and within specified tolerances.

2. Anchor formwork to shores, supporting surfaces, or members to prevent upward or lateral movement of the formwork system during concrete placement.

3. Provide runways for moving equipment. Support runways directly on formwork or structure, without resting on reinforcing steel.

4. Provide positive means of adjustment of formwork. Adjust and secure before concrete placement. Do not adjust formwork after concrete has achieved initial set.

B. Work Over Traffic:

1. Seal forms to prevent leaks.

2. Extend catchment beyond work zone to be made of rigid material.

C. Form Facing Materials:

1. Provide smooth form finish materials for surfaces exposed to public view.

2. Provide rough form finish materials for surfaces not exposed to public view.

D. Form Panels:

1. Maintain form panels clean, smooth, and free from imperfections and distortion.

2. Arrange form panels in symmetrical patterns conforming to general lines of the structure. Unless otherwise indicated, orient panels on vertical surfaces with long dimension horizontal and make horizontal joints level and continuous. Use largest stock size practicable.

3. Make panel joints and seams mortar tight. Install joint and seam sealers in accordance with the manufacturer's written instructions.

4. Align form panels on each side of a panel joint with fasteners common to both panels to provide a continuous concrete plane surface.

E. Construction Joints:

1. At construction joints exposed to view, lap contact surface of form sheathing for flush surfaces over the hardened concrete in the previous placement by not more than 1 inch.

2. Ensure formwork is held firmly against hardened concrete to prevent offsets or loss of mortar at construction joints and to maintain a true surface.

F. Edge Forms and Bulkheads:

1. Set edge forms, bulkheads, and intermediate screeds for slabs to obtain required elevations and contours in the finished slab surface. Ensure that edge forms and screed strips are sufficient to support the screeds to be used.

2. When formwork is cambered, set screeds to like camber to maintain required concrete thickness.

3. Brace bulkheads to prevent warpage or displacement. Set tightly against forms to prevent loss of concrete mortar.

4. Seal edge forms with joint and seam sealers such that neither a fin nor groove is made in the face of the cast concrete.

G. Corners: Provide 3/4-inch chamfer on all outside corners unless noted otherwise. Miter chamfer at intersections. Reentrant corners need not have fillets.

H. Embedded Items: Provide embedded items in conformance with the approved Shop Drawings. Secure to reinforcement or formwork to prevent movement during concrete placement. Fill voids with readily removable material to prevent entry of concrete.

I. Blockouts and Openings:

1. Securely wrap concrete blockouts with sheeting forming a smooth, tight-fitting surface. Overlap sheeting material at seams a minimum of six inches and tape both sides of sheeting.

2. Provide temporary openings at the base of column and wall formwork and other locations where necessary to facilitate cleaning and inspection. Clean and inspect immediately before concrete is placed.

3. Provide air escape holes in bottom members of blockouts in vertical forms.

J. Form Release Agent:

1. Apply form release agent in conformance with manufacturer's written instructions.

2. Coat form contact surfaces with form release agent before reinforcement is placed.

3. Do not allow excess form release agent material to accumulate in the forms.

4. Do not allow excess form release agent to come into contact with surfaces to be bonded to fresh concrete such as concrete reinforcement, embedded items, and hardened concrete.

5. Coat steel forms with non-staining, rust-preventive form release agent, or otherwise protect against rusting. Do not use rust-stained steel surfaces for forms in contact with concrete.

6. Apply release agent to bolts and rods that are to be removed or that are to be free to move.

3.03 REMOVAL OF FORMWORK

A. Maintain formwork supporting concrete weight in place until the concrete has attained the minimum percentage of specified design compressive strength and minimum number of days specified in Table 03 11 00-A, whichever comes later.

TABLE 03 11 00-A – Minimum Requirements for Formwork Removal		
Structural Member or Condition	**Minimum Compressive Strength (Percent of Minimum Design Compressive Strength)**	**Minimum Time**
Sides of forms not supporting the concrete weight, including columns, walls, crossbeams, non-sloping box girder webs, and abutments.	30	3 days
Side forms of footings, pile caps, and shaft caps.	30	18 hours
Crossbeams, sloping box-girder webs, struts, inclined columns, inclined walls, and other forms that support the concrete weight	80	5 days
Elevated slabs or beams over 20 feet span between supports	90	14 days
Elevated slabs or beams 10 feet to 20 feet span.	80	10 days
Elevated slabs or beams under 10 feet span	70	4 days
Post-tensioned systems	As soon as post-tensioning operations have been completed and approved	
Arches	90	14 days

B. Remove forms without injuring concrete surfaces, overstressing concrete members, or distorting formwork. Do not pry against concrete.

C. Remove forms only if shores have been arranged to permit removal of forms without loosening or disturbing shores.

D. Post-Tensioned Construction: Stressing of the post-tensioned system to be approved by the Resident Engineer. Do not strip formwork supporting cantilever slabs or edge beams until backshores and/or reshores have been placed.

E. Cut nails off flush. Leave surfaces clean and unblemished.

3.04 SHORING, RESHORING, AND BACKSHORING

A. Provide shoring in conformance with the approved Shop Drawings.

B. In multistory construction, extend shoring, backshoring or reshoring over a sufficient number of stories to distribute loads in such a manner that no floor or member will be excessively loaded or will induce tensile stress in concrete members without sufficient steel reinforcement.

C. Keep reshores or backshores in place after placing upper tier for a minimum of 15 days or longer, as required, until concrete has attained its required 28-day strength and heavy loads due to construction operations have been removed. Reshore if needed for construction loads on elevated floors and/or construction means and methods loads on floors.

D. Plan sequence of removal of shores and installation of backshores and reshores to avoid damage to concrete. Locate and provide adequate backshoring and reshoring to support construction without excessive stress or deflection.

E. Prevent construction loads on new construction during reshoring/backshoring.

3.05 CLEANING

A. Clean and repair surfaces of forms to be reused.

B. Apply form release agent as specified for new formwork.

C. Patch superficial or minor holes and defects in forms with materials and methods that will not be reflected in the concrete.

D. Do not reuse forms with raised grain, torn surfaces, worn edges, patches, dents, or other defects that will impair the texture of the concrete surface.

3.06 FIELD QUALITY CONTROL

A. Before placing concrete, verify the following:

1. Lines and levels of erected formwork are correct.

2. Formed and embedded items are located correctly and secured against movement.

3. Embedded piping and conduit are free from obstructions.

4. Loose tie-wire and other debris have been removed from the forms.

5. Surfaces of formwork and embedded items are free of mortar, grout, and other foreign matter.

6. Chamfer and Blockouts are located correctly and secured against movement.

7. Form release agent is applied.

B. While placing concrete, verify the following:

1. Formwork geometry is maintained within specified tolerances.

2. Cement paste is not lost through joints.

3. Maximum lift height, maximum pour length, and maximum pour rate is monitored, managed, and achieved (as required per submitted Shop Drawings).

C. Monitor movement during concrete placement. Adjust formwork as necessary to maintain tolerances.

END OF SECTION

SECTION 03 15 00

CONCRETE ACCESSORIES

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for furnishing and installing joint fillers and sealing compounds for joints in concrete.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. American Concrete Institute (ACI)

a. ACI 504R Guide to Joint Sealants for Concrete Structures.

2. American Society for Testing and Materials (ASTM) International:

a. ASTM D994/D994M Standard Specification for Preformed Expansion Joint Filler for Concrete (Bituminous Type).

b. ASTM D1751 Standard Specification for Preformed Expansion Joint Filler for Concrete Paving and Structural Construction (Nonextruding and Resilient Bituminous Types).

c. ASTM D2628 Standard Specification for Preformed Polychloroprene Elastomeric Joint Seals for Concrete Pavements.

d. ASTM D6690 Standard Specification for Joint and Crack Sealants, Hot Applied, for Concrete and Asphalt Pavements.

e. ASTM D7174 Standard Specification for Preformed Closed-Cell Polyolefin Expansion Joint Fillers for Concrete Paving and Structural Construction.

1.03 SUBMITTALS

A. Submit

1. Shop Drawings: Include single-line diagram showing location and dimension of all joints to be filled and sealed.

B. Transmit

1. Product data, safety data, and installation instruction from product manufacturer.

2. Samples: 12-inch long sample of joint filler and 1 pint or quart can of sealing compound to be submitted.

PART 2 - PRODUCTS

2.01 MATERIALS

A. Premolded Joint Filler must conform to ASTM D994/D994M or ASTM D1751. For structural joints and joints subject to expansion, provide joint filler conforming to ASTM D7174.

B. Joint Seal: Conform to ASTM D2628, for sealing of joints in slabs and at junctions of slabs and vertical surfaces. Use color selected by the Resident Engineer from the manufacturer's standards.

C. Hot Poured Joint Sealant must meet the requirements of ASTM D6690.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Verify that concrete conditions comply with the requirements of the manufacturer’s written directions before installation.

B. Verify that weather conditions comply with the requirements of the manufacturer’s written directions before installation.

3.02 PREPARATION

A. Prepare the surface in conformance with manufacturer’s written instructions.

3.03 INSTALLATION

A. General: Install and protect joint sealant in conformance with manufacturer’s written instructions.

END OF SECTION

SECTION 03 15 13

WATERSTOPS

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for furnishing and installing waterstops in concrete and spanning control, expansion, and construction joints to prevent fluid migration.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of following documents:

1. United States Army Corps of Engineers (COE):

a. COE CRD-C-513 Corps of Engineers Specifications for Rubber Waterstops.

b. COE CRD-C-572 Corps of Engineers Specifications for Polyvinylchloride Waterstops.

1.03 SUBMITTALS

A. Submit

1. Shop Drawings: Single-line diagram showing locations of all joints to receive waterstops, indicate type and size.

a. Include locations for shop fabricated and field fabricated splices to be used in the Work.

2. Detail Drawings:

a. Show location of waterstops.

b. Show details of supports.

B. Transmit

1. Product Data:

a. Manufacturers' product data.

b. Manufacturer’s written instructions for storage, handling, and installation.

c. Material Safety Data Sheets.

2. Samples:

a. 12-inch long sample of each waterstop.

1.04 DELIVERY, STORAGE, AND HANDLING

A. Deliver, store, and handle waterstops in conformance with manufacturers' written instructions.

B. Store waterstops to protect from oil, dirt, sunlight, and premature exposure to water.

PART 2 - PRODUCTS

2.01 PRODUCTS

A. PVC waterstops for construction and expansion joints meeting the requirements of COE CRD-C-572:

1. The PVC waterstop is extruded from an elastomeric plastic material of which the basic resin is prime virgin polyvinyl chloride.

2. The PVC compound does not contain any scrapped or reclaimed material or pigment.

B. Expansive waterstop comprised of hydrophilic, modified rubber meeting the requirements of COE CRD-C-513:

1. The waterstop is a combination of chloroprene rubber and chloroprene rubber modified to impart hydrophilic properties.

2. The waterstop must have a delay coating to inhibit initial expansion due to moisture present in fresh concrete.

C. Self-Expanding Butyl Strip Waterstops for use on hycrete concrete only: Manufacturered rectangular or trapezoidal strip, butyl rubber with sodium bentonite or other hydrophilic polymers, for adhesive bonding to concrete. Limit locations to use for Hycrete concrete only. Limit below grade use to Hycrete concrete locations where complete waterproofing membranes are provided on the exterior of the concrete. Install per manufacturer's written instructions. Acceptable products include the following or approved equal:

1. Cetco Waterstop Rx.

2. Sika Swellstop.

D. Self-Expanding Rubber Strip Waterstops: manufactured rectangular or trapezoidal strip, bentonite-free hydrophilic polymer modified choloprene rubber, for adhesive bonding to concrete:

1. Sika Hydrotite CJ.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Provide waterstops types and extents in locations as indicated on Issued for Construction Drawings.

B. Install waterstops in conformance with the manufacturer's written instructions:

1. Install waterstops accurately in place and secure rigidly against movement by methods adequate to assure proper support and embedment during the placement of concrete.

2. Install waterstops in the longest practicable length, with joints spliced to form a continuous watertight seal for the full length of the joint.

3. Place and consolidate concrete to ensure a complete filling and bond between the concrete and waterstop. Use cement-sand grout slurry optionallywhere necessary to assure contact and bond of waterstop and concrete without voids.

4. PVC waterstops:

    a. Heat fuse weld field butt splices by using a Teflon covered thermostatically controlled waterstop splicing iron at approximately 380 degrees Fahrenheit. Follow manufacturer's instructions.

    b. Lapping of waterstop and use of adhesives, or solvents are prohibited.

    c. Center waterstop in joint and secure waterstop in correct position using grommets, pre-punched holes, or hog rings spaced at 12 inches on centers along the length of the waterstop and wire tie to adjacent reinforcing steel.

5. Expansive waterstops:

    a. Cut coil ends square (or at proper angle for mitered corners) with shears or sharp blade to fit splices together without overlaps.

    b. Seal splices and exposed end cells using manufacturer's approved adhesive.

6. Self-Expanding Butyl Strip Waterstops:

    a. Cut coil ends square (or at proper angle for mitered corners) with shears or sharp blade to butt joints together without overlaps.

    b. Locate waterstops in center of joint unless otherwise indicated on Drawings. Position and secure using manufacturer's specified adhesive, mechanical fasteners, or other methods to ensure there is sufficient concrete coverage on all sides and waterstop remains in place during concrete placement.

    c. Protect installed waterstop from premature expansion prior to concrete placement. Replace waterstop material that exhibits significant expansion prior to concrete encapsulation.

3.02 FIELD QUALITY CONTROL

A. Waterstop installation is subject to inspection and acceptance by the Resident Engineer. Allow access for inspections.

END OF SECTION

SECTION 03 15 18

ELEVATED GUIDEWAY EXPANSION JOINTS

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for furnishing and installing elevated guideway expansion joints at the locations shown on the Issued for Construction Drawings.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. American Society for Testing and Materials International (ASTM):

a. ASTM A588/A588M Standard Specification for High-Strength Low-Alloy Structural Steel, up to 50 ksi Minimum Yield Point, with Atmospheric Corrosion Resistance.

b. ASTM D395 Standard Test Methods for Rubber Property – Compression Set.

c. ASTM D412 Standard Test Methods for Vulcanized Rubber and Thermoplastic Elastomers – Tension.

d. ASTM D471 Standard Test Method for Rubber Property – Effect of Liquids.

e. ASTM D573 Standard Test Method for Rubber – Deterioration in an Air Oven.

f. ASTM D624 Standard Test Method for Tear Strength of Conventional Vulcanized Rubber and Thermoplastic Elastomers.

g. ASTM D1149 Standard Test Methods for Rubber Deterioration – Cracking in an Ozone Controlled Environment.

h. ASTM D2240 Standard Test Method for Rubber Property – Durometer Hardness.

i. ASTM D3542 Standard Specification for Preformed Polychloroprene Elastomeric Joint Seals for Bridges.

2. American Association of Highway Transportation Officials / American Welding Society (AASHTO/AWS):

a. AASHTO/AWS D1.5 Bridge Welding Code.

1.03 SUBMITTALS

A. Submit:

1. Shop drawings:

a. Submit drawings in accordance with WSDOT Standard Specifications 6-02.3(13) Expansion Joints for the strip seal expansion joint system and compression seal expansion joint system.

b. Shop drawings explicitly set forth the proposed means by which the strip seal expansion joint is aligned and set to grade.

2. Welding Procedures:

B. Transmit:

1. Product Data:

a. Certificates of Compliance for the expansion joints confirming that the materials, fabrication, testing, and installation of the expansion joints are in conformance with these Specifications.

2. Expansion joint system's plan, elevation, section, location (bent number), nominal joint size or model number, and all dimensions for each expansion joint provided.

3. Manufacturers' Qualifications.

4. Manufacturer's written installation procedure

1.04 QUALITY ASSURANCE

A. The manufacturer of the elevated guideway expansion joints must be a firm specializing in the design and fabrication of expansion joints for bridge or similar structures.

B. The manufacturer must have a minimum of 5 years of experience specializing in expansion joints systems for similar applications.

C. Provide a technical qualified representative from the manufacturer of the expansion joints to train the installer on the proper techniques for installing the seal. Hire the manufacturer to register and approve each installation .

PART 2 - PRODUCTS

2.01 PRODUCTS

A. Employ one manufacturer to provide the expansion joints which is one of the following or approved equal:

1. Preformed, precompressed, self-expanding foam joint with silicone coating, epoxy bonded to sides of concrete surfaces, manufactured by EMSEAL for BEJS joint system (EMSEAL BEJS), or approved equal.

2. Preformed neoprene seal epoxy bonded to sides of concrete surfaces (neoprene seal). The manufacturer and system must be one of the following or approved equal:

a. D.S. Brown JP Series.

b. Watson Bowman Jeene FW Series Structural Sealing System.

3. Strip seal expansion joints are preformed neoprene seals with embedded steel retainer rails and must be from the same manufacturer and must be one of the following or approved equal:

a. D.S. Brown Steelflex Strip Seal Expansion Joint Systems.

b. Watson Bowman Acme Wabo Strip Seal.

B. BEJS Joint System by EMSEAL:

1. Provide materials meeting all requirements of EMSEAL for BEJS system or approved equal.

2.02 MATERIALS

A. Expansion joints materials are new and unused, with no reclaimed material incorporated in the finished expansion joints.

B. Neoprene:

1. Preform and manufacture the seal is from vulcanized elastomeric compound using polymerized chloroprene (neoprene) as the only base polymer.

2. Prefabricate the seal in the shop to fit the final dimensions of the joint as it occurs on the guideway. No field splices are allowed.

3. Use an extruded neoprene compound for the seal material conforming to the physical properties shown in the table below, in accordance with ASTM D3542**.**

Physical Properties of Neoprene Elastomeric Joint Seals		
Property	**Requirements**	**Test Method**
Tensile Strength • Before aging: • After oven aging 70 hours @ 212 degrees F, loss in percent.	2000 PSI, min. 20 percent loss, max.	ASTM D412 ASTM D573
Elongation at Break • Before aging: • After oven aging 70 hours @ 212 degrees F	250 percent, min. 20 percent loss, max.	ASTM D412 ASTM D573
Hardness, Type A Durometer • Before aging: • After oven aging: 70 hours @ 212 degrees F • After 7 days @ +14 degrees F	65±5 points 0 to +10 points 0 to +15 points	ASTM D2240 ASTM D573 ASTM D2240
Ozone Resistance, under 20 percent strain:	No cracks	ASTM D1149
Weight change in oil after 70 hours at 104 degrees F in ASTM Oil No. 3, weight change:	45 percent, max.	ASTM D471
Compression Set, 70 hours @ 212 degrees F	40 percent max.	ASTM D395

C. Epoxy adhesive: 2-part epoxy adhesive meeting the seal manufacture's written requirements.

D. Steel retainer rails must be in accordance with ASTM A588/A588M. Retainer rails must be one piece construction. Galvanize all embedded metal items according to shop applied coatings for metal requirements as stated in the Issued for Construction Documents. Additionally, coat all embedded metal items' exposed surfaces with high performance coating, HPC-3, color Washington Gray as stated in the Issued for Construction Documents.

2.03 FABRICATION

A. Shop fabricate the entirety of the seals.

B. The seal must be preformed and manufactured from vulcanized elastomeric compound using polymerized chloroprene (neoprene) as the only base polymer.

C. The size, shape, and dimensional tolerances of the seals must be as shown on the Issued for Construction Drawings.

D. Construct the joint sides straight and parallel to each other to the proper width and depth indicated on the Issued for Construction Drawings to prevent any wedging from expansion and contraction.

E. The seal must be one continuous piece for the full length. Splices, stretched, and glued joints are prohibited.

F. Clearly mark shipping containers with the name of the manufacturer, lot number, and the date of manufacture.

G. Welding must be in accordance with AASHTO/AWS D1.5.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install the expansion joint assemblies in accordance with the information shown in the Issued for Construction Drawings, the Shop Drawings and the manufacturer's instructions.

B. Place a polyurethane backer rod in the seal cavity of the strip seal steel retainer rails by the Contractor prior to pouring concrete and to stay in place until concrete poured.

C. Installed expansion joints to be watertight. After the joint system is installed, flood the joint with water and inspect, from below the joint, for leakage.

D. Installed expansion joints to be free of damage.

END OF SECTION

SECTION 03 15 25

ANCHORAGE TO CONCRETE

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for anchoring systems to attach structural steel and metal fabrications or equipment to concrete or concrete masonry. Specifications are included for reinforcement dowels to attach concrete to concrete or concrete masonry.

2. Provisions for vibratory anchorage design for mechanical equipment are given in Sound Transit Standard Specifications Division 22 – Plumbing and Division 23 – Heating, Ventilation, and Air Conditioning.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the documents:

1. American Concrete Institute (ACI).

   a. ACI 318 Building Code Requirements for Structural Concrete.

   b. ACI 355.2 Qualification of Post-Installed Mechanical Anchors in Concrete.

2. American National Standards Institute (ANSI):

   a. B212.15 Cutting Tools - Carbide-Tipped Masonry Drills and Blanks for Carbide-Tipped Masonry Drills.

3. American Society for Testing and Materials International (ASTM):

   a. ASTM A108 Standard Specification for Steel Bar, Carbon and Alloy, Cold-Finished.

   b. ASTM A1064 Standard Specification for Carbon-Steel Wire and Welded Wire Reinforcement, Plain and Deformed, for Concrete.

   c. ASTM A563 Standard Specification for Carbon and Alloy Steel Nuts.

   d. ASTM A615 Standard Specification for Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement.

   e. ASTM A706 Standard Specification for Deformed and Plain Low-Alloy Steel Bars for Concrete Reinforcement.

   f. ASTM F1554 Standard Specification for Anchor Bolts, Steel, 36, 55, and 105-ksi Yield Strength.

g. ASTM F2329 Standard Specification for Zinc Coating, Hot-Dip, Requirements for Application to Carbon and Alloy Steel Bolts, Screws, Washers, Nuts, and Special Threaded Fasteners.

h. ASTM F436 Standard Specification for Hardened Steel Washers.

4. American National Standards Institute/American Welding Society (ANSI/AWS):

a. ANSI/AWS D1.1 Structural Welding Code – Steel.

b. ANSI/AWS D1.4 Structural Welding Code – Reinforcing Steel.

c. AAASHTO/AWS D1.5 Bridge Welding Code.

5. International Code Council – Evaluation Service (ICC-ES):

a. ICC-ES AC 193 Mechanical Anchors in Concrete Elements.

b. ICC-ES AC 308 Post-Installed Adhesive Anchors in Concrete Elements.

1.03 SUBMITTALS

A. Submit:

1. For deferred design that is performed by the subcontractor, in advance of anchor installation, submit to the Resident Engineer the calculation set of anchorage design sealed by a Professional Engineer licensed in the State of Washington for approval.

2. Embedment shop drawings that include the embed plate fabrication shop drawing and the plans/ elevations showing the exact location of the embed in wall, column, slab, beam or other concrete element. Dimension this position from the gridlines and floor levels or other major geometry key. The Coordinate the embed position drawing with the related formwork, rebar and mechanical/ electrical/ plumbing embeds shop drawings before submitting for review. The review and approval of anchor shop drawings, erection drawings and anchor design calculations must consider all anchor attachments by other trades.

3. Photos of desired post-installed concrete anchors with locations of reinforcement identified by scanning.

4. Failed Anchor or Dowel Documentation: Documentation for anchors or dowels for an anchor or dowel that does not pass the test acceptance criteria specified in this specification. Submit failed anchor or dowel documentation to the Resident Engineer. The documentation must include, but not be limited to, the following:

a. Exact location of failed anchor.

b. Reason for failure.

c. Repair steps taken.

d. Inspector's name.

e. Date of test.

B. Transmit:

1. Product Data:

a. Manufacturer’s name.

b. Product Series/Catalog No.

c. Testing results.

d. Mill certificates.

e. Certificate of material origin.

f. Certificate of compliance.

2. Cast-In Concrete Anchors:

a. Mill certificates demonstrating conformance.

3. Post-Installed Concrete Anchors or dowels:

a. Manufacturer’s Product Data demonstrating conformance.

b. Manufacturer’s written instructions for storage, handling, and installation.

4. Welding: See Section 05 05 23 - Metal Fastening

5. Source Quality Control inspection and test reports.

6. Field Quality Control inspection and test reports.

7. Qualifications:

a. Professional Engineer: License number and current work history.

b. Post-Installed Anchor or Dowel Installer.

1.04 QUALITY ASSURANCE

A. Welder Certification: Current Washington Association of Building Officials certification for each process, method, position, and size of weld executed.

B. Weld Procedure Specification: ANSI/AWS D1.1, D1.4, or D1.5.

C. Post Installed anchors or dowels:

1. Provide an on-site Quality Control Program for all post-installed adhesive anchors or dowels in accordance with ICC-ES AC308 Articles 14.3 and 14.4.

2. Post-installed anchors or dowels must be installed by an installer with a minimum of five years' experience performing similar installations.

3. Installer Training: Conduct thorough training with the manufacturer or the manufacturer’s representative for the installer on the Project. Training must consist of a review of the complete installation process for drilled-in anchors including, but not limited to, the following:

a. Hole drilling procedure.

b. Hole preparation and cleaning technique.

c. Adhesive injection technique and dispenser training/maintenance.

d. Anchor element type, material, diameter, and length.

e. Proof loading/torquing.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Deliver cast-in concrete anchor materials to the fabricator tied and identified with plastic tags indicating the mill, melt or heat number, and the grade and size of bar.

B. Store and handle concrete anchors in conformance with manufacturer's written instructions.

1.06 SOURCE QUALITY CONTROL

A. All shop welds must be visually inspected.

PART 2 - PRODUCTS

2.01 PRODUCTS

A. Post-Installed Concrete Anchors and Dowels:

1. Expansion Anchors:

a. Hilti Kwik Bolt TZ, DeWalt Power-Stud+SD2, Simpson Strong-Bolt 2, or approved equal.

2. Adhesive Anchors:

a. Adhesive: Hilti HIT–RE 500-V3, DeWalt Pure110+, Simpson Set-XP, or approved equal.

3. Undercut Anchors:

a. Hilti HDA Undercut, DeWalt Atomic+ Undercut, Simpson Torq-Cut, or approved equal.

4. Screw Anchors:

a. Hilti Kwik HUS-, DeWalt Screw-Bolt+, Simpson Titen HD, or approved equal. Limit the use of permanent screw anchors for non-corrosive interior applications only.

5. Substitute Products: Substitute post-installed concrete anchor products, if submitted, must have current International Code Council Evaluation Service (ICC-ES) or International Association of Plumbing and Mechanical Officials (IAPMO) code report approval for use in cracked concrete.

6. Unless noted otherwise, use galvanized post-installed anchors, or approved equal.

7. Post-installed rebar dowels: ASTM A615/A706, unless noted otherwise.

B. Post-Installed Masonry Anchors:

1. Adhesive Anchors:

a. Hilti HIT-HY 270, DeWalt AC100+ Gold, Simpson Set-XP, or approved equal.

2. Screw Anchors:

a. Hilti Kwik HUS, DeWalt Screw-Bolt+, Simpson Titen HS, or approved equal. Limit the use of permanent screw anchors for non-corrosive interior applications only.

3. Substitute Products: Substitute post-installed masonry anchor products, if submitted, must have current International Code Council Evaluation Service (ICC-ES) or International Association of Plumbing and Mechanical Officials (IAPMO) code report approval for use in cracked concrete.

2.02 MATERIALS

A. Cast-in Concrete Anchors:

1. Reinforcing Bars: ASTM A615/A706, unless noted otherwise.

2. Anchor Rods:

a. ASTM F1554 Grade 36 with ASTM A563A hex nuts.

b. ASTM F1554 Grade 55 S1 with ASTM A563A heavy hex nuts.

c. ASTM F1554 Grade 105 with ASTM A563DH heavy hex nuts.

d. Washers: ASTM F436.

3. Welded Headed Studs: ASTM A108, grades 1015 through 1020, headed stud type, cold finished carbon steel, AWS D1.1, Type B; with fluxed end conforming to ANSI/AWS D1.1.

4. Deformed Bar Anchors: ASTM A1064 with fluxed end conforming to ANSI/AWS D1.1.

B. Welding electrode:

1. Match filler metal requirements in conformance with ANSI/AWS D1.1, D1.4, or AASHTO/AWS D1.5.

2.03 FABRICATION

A. Reinforcing Bars Specification ASTM A706:

1. Fabrication: Section 03 20 00 - Concrete Reinforcing.

2. Welding: ANSI/AWS D1.4.

B. Welded Headed Studs: Weld to structural steel and metal fabrications in conformance with ANSI/AWS D1.1 and manufacturer's written instructions.

C. Deformed Bar Anchors: Weld to structural steel and metal fabrications in conformance with ANSI/AWS D1.1 and manufacturer's written instructions.

2.04 FINISHES

A. Cast-in Concrete Anchors:

1. Anchor Rods:

a. Galvanized Carbon and Alloy Steel: ASTM F2329.

b. Stainless Steel: ASTM F593 Grade 316 CW with ASTM F594 hex nuts and ASTM A240 washers.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Cast-In Concrete Anchors:

1. Anchor Rods: Install anchors as indicated on Issued for Construction Drawings. Secure to formwork or reinforcement to prevent movement during concrete placement. Protect threads until structural steel or metal fabrication is installed.

B. Post-Installed Concrete Anchors or Dowels:

1. Install post-installed anchors or dowels in sound concrete only. Report surfaces showing obvious distress by way of porosity, disintegration, carbonation, and cracks over 0.02-inch in width and 12-inches or longer and within the distance of the embedment length to the Resident Engineer:

2. Preparation for drilling:

a. Scan and identify existing reinforcement must be on surface prior to drilling. Scanning using non-destructive X-ray or ground-penetrating radar procedures is permitted. This includes scanning for both top and bottom surfaces of concrete if the Issued for Construction Drawings indicate there are multiple reinforcement layers. Identify other non-reinforcement embeds. Leave adequate distance between the post-installed anchor or dowel and existing reinforcement or embeds locations to account for scan tolerance.

b. No cutting of reinforcement is permitted without prior written approval from the Resident Engineer. Multi-cutting of the same bar is considered as one cut.

c. Reinforcement is considered to be cut if:

1) For No. 4 through No. 7: Cuts, nicks, or drill into bar body are greater than 1/16-inch.

2) For No. 8 and Larger: Cuts, nicks, or drill into bar body are greater than 1/8-inch.

d. When installing anchors through cut reinforcement, locate the anchoring mechanism at least two anchor diameters beyond the cut reinforcement.

e. If the desired location of the anchor(s) conflicts with reinforcement that is not permitted to be cut, relocate the anchor upon approval from the Resident Engineer.

3. Install post-installed anchors in accordance with the ICC-ES/IAPMO reports and manufacturer’s installation instructions. Where installation criteria differ, the order of precedence from highest to lowest is: 1) this Specification; 2) the ICC-ES/IAPMO reports; 3) the manufacturer’s installation instructions.

4. Drill holes for post-installed anchors with carbide-tipped bits using rotary hammer drills meeting the requirements of ANSI B212.15 unless ICC-ES AC193 or ICC-ES

AC308 testing demonstrates that using percussive drilling or another type(s) of bit, including core drills, is acceptable. Clean drilled holes of chips, dust, loose material, and water prior to anchor installation. The hole diameters and depths are per the manufacturer's instructions. Check the hole diameter every ten holes for conformance to the hole tolerances specified in ICC-ES AC308 for adhesive anchors, ICC-ES AC193 or ACI 355.2 for mechanical anchors. Verify depth of the concrete member before drilling holes. For embedment depth of the post-installed anchor, do not exceed the greater of 2/3 of the concrete member thickness or the concrete member thickness minus 4-inches, or what is allowed by the manufacturer. Contact the Resident Engineer if these requirements cannot be met based on the actual member thickness.

5. Install anchors or dowels perpendicular to the concrete surface within a plus or minus 5-degree tolerance. Visual inspection for post-installation verification of this criterion is acceptable to verify proper seating of the nut and washer.

6. In areas where concrete has been removed, measure the minimum anchor embedment from the surface of sound concrete.

7. Unless otherwise noted on the Issued for Construction Drawings, use the spacing requirements indicated in the applicable ICC ES/IAPMO report.

8. Bending and welding of post-installed anchors is not permitted.

9. The nut thread engagement for the anchors (studs) must be such that the bolt threads project past the outside face of the nut when completely installed.

10. Do not damage the length identification code on the head of the anchor during installation. Anchor projection to be cut-off is subject to the approval of the Engineer of Record and documentation of the location, embedment, and length code.

11. Drive in unused anchors and cut-off flush. Cut-off anchors are considered an abandoned ungrouted hole for future anchor spacing requirements.

12. Avoid bending anchors to match base plate holes or loosening of anchors by prying sideways after tightening. Ensure that the cone nut of an undercut anchors does not become loose from the stud during the setting or tensioning operation.

13. Non-grouted base plates with a maximum 1/8-inch gap is acceptable as evidenced under exterior edges around the plate provided that 1) the plate exhibits bearing contact within its interior against the concrete surface; and 2) the uneven bearing does not prevent application of the prescribed torque. If an unacceptable bearing contact condition exists, one of the following procedures applies:

    a. Rework the concrete surface to obtain a proper fit.

    b. For gaps of up to 1-inch, grout the base plate instead, using the following technique:

        1) Insert post-installed anchors and set the base plate.

        2) Insert nuts to finger-tight condition.

        3) Install shims positioned no more than 1/2-inch away from the anchors to reduce gaps between base plate shims to 1/8-inch or less at anchor locations.

4) Apply tightening torque. Do not tighten the bolt when interior shims under the base plates have been placed away from anchors so that downward bending of the base plate would result upon tightening. Move shims as close as possible to the anchors before applying the installation torque.

5) Fill the gap with non-shrink grout leaving the shims in place. For base plates on walls where grouting is not feasible, fill the gap with shim plates. Stack the shims but with no more than four shims.

14. Relocating Holes Within Base Plates: Relocate the base plate with bolts no more than 1-inch in any direction with respect to the attachment principal axis unless otherwise noted on the Issued for Construction Drawings.

15. Do not use adhesive anchors for conditions that place constant tensile loads on the anchor.

3.02 FIELD QUALITY CONTROL

A. Post-Installed Concrete Anchors and Dowels:

1. Require full-time special inspection for all adhesive anchor systems together with proof load testing. Proof load testing only does not meet special inspection requirements.

2. Test (Proof) Load: Indicate Tension test (proof) load on the approved shop drawings:

a. For post-installed adhesive anchors or dowels, perform a confined test in accordance with ICC-ES AC308 which is equal to the lesser of:

1) A tensile load equal to 80-percent of the specified nominal yield strength of the anchor bolt material times the tensile area of the bolt; or

2) A tensile load equal to twice the design load and at least 50 percent of the expected ultimate load based on the adhesive bond strength shown in the ICC-ES/IAPMO report, whichever is greater.

3. For post-installed mechanical anchors, perform an unconfined test in accordance with ASTM E488 or ACI 355.2 equal to the lesser of the following. Retighten post-installed anchors tested by this method by applying the installation torque:

a. Tensile load equal to 80-percent of the specified nominal yield strength of the anchor bolt material times the tensile area of the bolt.

b. Tensile load based on a multiplied amplification factor of the anchor design capacity as provided in an approved evaluation report as one of the following:

1) Twice (2x) the maximum allowable tension load (Allowable Stress Design).

2) One and a quarter (1-1/4x) times the maximum design strength of the anchor (Ultimate, LRFD based load capacity).

4. Test Frequency: Unless otherwise specified, the following test frequencies must apply:

Post-Installed Anchor & Rebar Dowel Testing Frequency			
Test Category	**Condition**	**Initial Test Frequency**	**Notes**
A	• All except conditions listed in B below.	100 percent or twenty (20) in single application, whichever is less. Examples of single application: anchor bolt group for one equipment, rebar dowels of same diameter installed to one beam.	1. Testing frequency is only reduced in a single application and subject to the approval of the Resident Engineer and is not to be less than 25 percent or twenty (20), whichever is less. 2. In the next application, location or occasion, or should any anchor tests fail, reset the testing frequency to initial frequency. 3. Do not reduce the number of tests on any adhesive anchor/ dowel installed overhead. 4. Do not reduce the number of tests on any adhesive anchor/ dowel installed in plinth. 5. Anchors to be tested must be randomly selected by the inspector and tested in the presence of the inspector.
B	• Post-installed anchors to wall with load ≤ 250lbs. • Post-installed anchors to paving for sign posts ≤ 6 ft. in. height and ≤ 100 lbs. • Post-installed mechanical anchors supporting distributed systems weighing ≤ 5 lb./ft.	10 percent or minimum of five (5) whichever is greater, in any single application	Increase testing to 50 percent if any anchor fails until 10 anchors not previously tested and randomly selected by the inspector pass, then resume initial test frequency.

5. Acceptance Criteria: A post-installed anchor is acceptable if the test load specified in this specification is attained without:

a. Slippage of more than:

1) 1/16-inch for adhesive anchors

2) 2.5-percent of the embedded length, rounded to the nearest 1/16-inch for mechanical anchors

b. Bolt failure

c. A sign of damage in the surrounding concrete.

6. Installation Inspection Record:

a. Test Inspection Record: Include in the test inspection record, but not be limited to, the following information:

1) Product description, including product name.

2) Adhesive expiration date.

3) Anchor or rebar diameter and steel grade.

4) General location of anchor and group represented.

5) Method of test or verification.

6) Test results, accepted or rejected.

7) Inspector’s name.

8) Date of test.

9) Identification number of testing tool.

END OF SECTION

SECTION 03 20 00

CONCRETE REINFORCING

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for fabrication, welding, and placement of steel reinforcing for concrete, and concrete reinforcing accessories.

B. This Section incorporates by reference the latest revisions of the following documents:

1. American Concrete Institute (ACI):

a. ACI 116R Cement and Concrete Terminology.

b. ACI SPEC-117 Specification for Tolerances for Concrete Construction and Materials.

c. ACI PRC-315 Guide to Presenting Reinforcing Steel Design Details.

d. ACI CODE-318 Building Code Requirements for Structural Concrete and Commentary.

2. American National Standards Institute/American Welding Society (ANSI/AWS):

a. ANSI/AWS D1.4 Structural Welding Code – Reinforcing Steel.

3. American Society for Testing and Materials International (ASTM):

a. ASTM A82/A82M Steel Wire, Plain, for Concrete Reinforcement.

b. ASTM A615/ A615M Standard Specification for Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement.

c. ASTM A706/A706M Standard Specification for Deformed and Plain Low-Alloy Steel Bars for Concrete Reinforcement.

d. ASTM A775/A775M Standard Specification for Epoxy-Coated Steel Reinforcing Bars.

e. ASTM A884/A884M Standard Specification for Epoxy-Coated Steel Wire and Welded Wire Reinforcement.

f. ASTM A970/A970M Standard Specification for Headed Steel Bars for Concrete Reinforcement.

g. ASTM A1035/A1035M Standard Specification for Deformed and Plain, Low-Carbon, Chromium, Steel Bars for Concrete Reinforcement.

h. ASTM A1064/A1064M Standard Specification for Carbon-Steel Wire and Welded Wire Reinforcement, Plain and Deformed, for Concrete.

4. Concrete Reinforcing Steel Institute (CRSI):

   a. CRSI Manual of Standard Practice.

   b. CRSI Publication, Placing Reinforcing Bars.

C. Definitions:

1. Placing Drawings: Working drawings showing the grade, quantity, size, length, and location of the reinforcing steel necessary for the fabrication and placement of the material, including bending schedules, bending details, and material lists (bills of material).

2. With the above exception, the words and terms used in this Section conform to the definitions given in ACI 116R.

1.02 SUBMITTALS

A. Submit

1. Shop Drawings:

   a. Detail reinforcing steel in conformance with ACI 315.

   b. Furnish bar lists, bending diagrams and schedules. Include weights on bar lists.

   c. Indicate locations for placement of reinforcing and reinforcing support. Include number of pieces, size, and markings of reinforcing steel.

   d. Indicate locations of lap splices, welds, mechanical splices, and mechanical anchors.

   e. Indicate locations of anchors, hangers, inserts, bolts, conduits, sleeves, block outs, and other items to be cast in concrete for possible interference with reinforcing steel.

   f. Identify the specification and grade of the reinforcing steel to be placed at each location.

B. Transmit

1. Product Data

   a. Manufacturer’s name

   b. Product Series/Catalog No.

   c. Testing results

   d. Mill certificates

   e. Certificate of material origin

   f. Certificate of compliance

2. Mill Certificates: For each lot or load of reinforcing steel delivered to the jobsite.

3. Evaluation Reports: Submit Evaluation Reports from the ICC Evaluation Service, Inc., or from a Certified Testing Facility using ICC ES AC133 test procedure, for all:

   a. Mechanical splices.

   b. Mechanical anchorages.

4. Manufactured Products: For each manufactured product submit:

   a. Manufacturer's Product Data.

   b. Manufacturer's written instructions for storage, handling, and installation.

5. Welder Certifications: Submit current Washington Association of Building Officials reinforcing steel welding certifications for each welder, valid for each process, method, position, and bar size used.

6. Welder Procedures Specification: Submit welding procedures specification for all reinforcing steel welds in conformance with ANSI/AWS D1.4.

7. Test Reports:

   a. Reports for weld procedure qualification.

   b. Test reports demonstrating acceptance of weld procedure specifications.

   Shop and field weld inspection reports.

1.03 DELIVERY, STORAGE, AND HANDLING

A. Deliver reinforcing steel to the fabricator in bundles, limited to one size and length of bar, securely tied and identified with plastic tags in an exposed position indicating the mill, the melt or heat number, and the grade and size of bars.

B. Deliver reinforcing steel to the jobsite properly tagged and identified.

1. Store, block up and protect in a manner that will prevent damage.

2. Protect from moisture, dirt, grease, oil, and other foreign materials that might impair bond with concrete.

3. Maintain identification of reinforcing steel after bundles are broken.

4. Store and handle manufactured items in conformance with manufacturer's written instructions.

PART 2 - PRODUCTS

2.01 MATERIALS

A. Deformed Bars:

1. Reinforcing Steel Bars:

   a. ASTM A706 Grade as indicated on the Issue for Construction drawings.

   b. ASTM A615, Grade as indicated on the Issue for Construction drawings.

2. Weldable Reinforcing Steel Bars (including Cathodic Protection and Grounding reinforcement): ASTM A706, Grade 60, unless otherwise indicated. Do not Splice or couple Grade 80 bars, unless otherwise noted in the Issue for Construction drawings.

3. Headed Bars: ASTM A970.

4. MMFX Reinforcing Steel: ASTM A1035 CS Grade 100, unless otherwise indicated on the Issue for Construction.

B. Epoxy Coated Bars:

1. Epoxy coating: ASTM A775.

C. Welded Wire Fabric:

1. Plain Wire: ASTM A1064.

2. Deformed Wire: ASTM A1064.

D. Smooth Dowel Bars: ASTM A615 Grade 60.

E. Wire and Plain Bars: ASTM A1064.

F. Tie Wire: ASTM A1064, No. 16 gauge or heavier, black or galvanized, soft or commercial grade steel tie wire.

G. Epoxy Coated Tie Wire: ASTM A884, Class A, Type 1.

H. Epoxy Repair Coating: Liquid two-part, compatible with epoxy material and conforming to ASTM A775.

I. Accessories:

1. Provide reinforcement accessories as required for spacing, assembling, and supporting reinforcement in place. Conform to CRSI Manual of Standard Practice.

2. Provide metal chairs with Class 1 or Class 2 protection.

3. Provide concrete blocks with compressive strength equal to or greater than the concrete being placed.

J. Mechanical Splices:

1. Capable of being installed in clear space indicated.

2. Mechanical Splices must conform with Type 1 or 2 in accordance with ACI 318.

K. Mechanical Anchorages:

1. Capable of being installed in clear space indicated.

2. Capable of developing at least 125 percent of the yield strength of anchored reinforcing bar.

L. Welding Electrodes:

1. Match filler metal requirements in conformance with ANSI/AWS D1.4

2.02 FABRICATION

A. Conform approved placing drawings.

B. Cutting and Bending:

1. Perform cutting and bending at a central location, equipped and suitable for the purpose.

2. Accurately cut and cold bend bars as indicated on the approved placing drawings. Do not heat bars for bending or straightening. Do not bend, rebend or straighten bars in a manner that will injure the material.

3. Do not use straightened bars.

4. Label all bars in conformance with approved placing drawings. Secure like pieces in bundles when appropriate.

C. Welding: ANSI/ AWS D1.4.

2.03 SOURCE QUALITY CONTROL

A. Tolerances:

1. Fabrication: Comply with ACI 117 and CRSI Manual of Standard Practices.

B. Identification:

1. Bundle and tag reinforcing steel with grades and sizes, heat numbers, and suitable identification marks for checking, sorting, and placing.

2. Mark tags with sizes and numbers corresponding to approved placing drawings and schedules.

3. Use waterproof tags and markings that cannot be removed until steel reinforcement is placed in position.

C. Epoxy Coating

1. Epoxy mill thickness: thickness verification

D. Shop Welding Inspection:

1. Inspect all shop welds in conformance with ANSI/AWS D1.4.

2. Nondestructive splice tests on welded direct butt splices of hoop reinforcement for columns and shafts using complete joint penetration must follow WSDOT Standard Specification 6-02.3(24)J.

PART 3 - EXECUTION

3.01 PREPARATION

A. Prior to placing reinforcing:

1. Verify that surfaces over or against which reinforcing is to be placed are clean and in proper condition for placing reinforcement.

2. Verify items to be embedded in concrete are secured in place.

3.02 INSTALLATION

A. General:

1. Install reinforcement in accordance with CRSI Publication, Placing Reinforcing Bars.

2. Install concrete reinforcing in conformance with approved placing drawings.

3. Install reinforcement accurately and secure against movement from concrete placement.

4. Do not cut, bend, or straighten bars in the field unless directed by Resident Engineer.

B. Reinforcing Supports: Support bars on metal chairs, concrete blocks, spacers, and/or hangers, accurately placed and securely fastened to steel reinforcement in place. Support legs of accessories in forms without embedding in the form surface. Support epoxy-coated reinforcing on epoxy coated or other dielectric-polymer-coated wire bar supports, or plastic bar supports.

C. Placing and Tying: Install reinforcing steel in place securely to prevent displacement. Bend ends of wire ties away from forms. Do not secure bars to the sides or bottom of the forms using tie wire. Tie epoxy-coated reinforcing with epoxy-coated tie wire. Tack welding is not permitted on reinforcing steel.

D. Lap Splices: Stagger splices of alternate bars a minimum clear offset of 4 feet between splices, unless noted otherwise on Issued for Construction Drawings, or as indicated on the approved placing drawings.

E. Mechanical Splices: Install in conformance with the manufacturer's written instructions. Where mechanical splices are connected to reinforcement on only one end and embedded in concrete, provide a metal cap on the open end to protect the interior of the splice and prevent intrusion of concrete.

F. Mechanical Anchorages: Install in conformance with the manufacturer’s written instructions.

G. Dowels: Provide additional bars for proper support of dowels where required. Furnish and use templates for placement of column dowels. Provide additional bars for proper support and anchorage where required. Do not bend dowels after embedment.

H. Welded Wire Fabric: For slabs on grade, extend welded wire fabric to within 2 inches of the concrete edge. Lap edges and ends of sheets a minimum of one mesh spacing. Do not extend welded wire fabric through contraction joints. Support welded wire fabric during placing of concrete to ensure required positioning in the slab. Do not place welded wire fabric on grade and raise into position after concrete placement.

I. Concrete Cover: Provide concrete cover over steel reinforcement as shown on Issued for Construction Drawings.

J. Protection of Waterproofing Membrane: Where reinforcement is to be installed over a waterproofing membrane, protect the membrane during installation of the reinforcement to avoid punctures, tears, and abrasion. Notify the Contractor’s Quality Assurance Manager and the Resident Engineer immediately if the membrane is damaged.

K. For installed rebar exposed for 12 months or longer, apply galvanizing paint in accordance with WSDOT Specification 6-02.3(24)B Protection of Materials and 9-08.1(2)B Galvanizing Repair Paint, High Zinc Dust Content. For exposed rebar within 3 miles from a major saltwater body the Contractor must submit the protective plan to Sound Transit for review and approval.

3.03 FIELD QUALITY CONTROL

A. Placing Tolerances: ACI 117 and CRSI Manual of Standard Practices:

1. Adjustment: Move bars as necessary to avoid interference with other reinforcing steel or embedded items. Do not increase the maximum spacing or reduce the total number of bars. Replace and secure all bars moved to permit access for cleanup operations before the start of concrete placement.

B. Perform the following tests with the Contractor's Quality Assurance Manager and the Resident Engineer present during reinforcing placement:

1. Mechanical Splices:

a. Provide continuous inspection of 100 percent of installed splices.

b. Remove and replace incorrectly installed splices.

2. Mechanical Anchorages and Anchorages:

a. Provide continuous inspection of 100 percent of installed anchorages.

b. Remove and replace incorrectly installed anchorages.

3. Field Welding:

a. Visually inspect all field welds in conformance with ANSI/AWS D1.4.

b. Further inspection requirements are per the Issued for Construction Documents.

C. Perform the following inspections with the Contractor's Quality Assurance Manager and the Resident Engineer present prior to placing concrete:

1. Placement: Visually inspect reinforcing placement for conformance with the placing drawings. Verify the following:

. Bar grade.

a. Bar size, length, and bends.

b. Bar location, quantity, spacing, and cover.

c. Lap splice types, lengths, and locations.

d. Sufficient ties, supports, and side form spacers.

e. Bars are free from foreign materials that might impair bond with concrete.

2. Waterproofing Membrane: Verify integrity of waterproofing membrane.

3.04 CLEANING

A. Clean reinforcement free of foreign materials that might impair bond with concrete.

END OF SECTION

SECTION 03 30 00

CAST-IN-PLACE CONCRETE

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for conveying, placing, finishing, curing, protecting, and testing cast-in-place concrete.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. American Concrete Institute (ACI):

a. ACI SPEC-301 Specifications for Concrete Construction.

b. ACI PRC-304 Guide for Measuring, Mixing, Transporting, and Placing Concrete.

c. ACI PRC-304.2R Guide to Placing Concrete by Pumping Methods.

d. ACI PRC-305R Guide to Hot Weather Concreting.

e. ACI SPEC-306.1 Standard Specification for Cold Weather Concreting.

f. ACI PRC 308R – Guide to External Curing of Concrete

g. ACI PRC-309 Guide for Consolidation of Concrete.

h. ACI 503.2-503.4 Three Epoxy Specifications.

2. American Society for Testing and Materials (ASTM) International:

a. ASTM C31/C31M Standard Practice for Making and Curing Concrete Test Specimens in the Field.

b. ASTM C33/C33M Standard Specification for Concrete Aggregates.

c. ASTM C39/C39M Standard Test Method for Compressive Strength of Cylindrical Concrete Specimens.

d. ASTM C42/C42M Standard Test Method for Obtaining and Testing Drilled Cores and Sawed Beams of Concrete.

e. ASTM C94/C94M Standard Specification for Ready-Mixed Concrete.

f. ASTM C143/C143M Standard Test Method for Slump of Hydraulic-Cement Concrete.

g. ASTM C150/C150M Standard Specification for Portland Cement.

h. ASTM C171 Standard Specification for Sheet Materials for Curing Concrete.

i. ASTM C172/C172M Standard Practice for Sampling Freshly Mixed Concrete.

j. ASTM C231/C231M Standard Test Method for Air Content of Freshly Mixed Concrete by the Pressure Method.

k. ASTM C309 Standard Specification for Liquid Membrane-Forming Compounds for Curing Concrete.

l. ASTM C470/C470M Standard Specification for Molds for Forming Concrete Test Cylinders Vertically.

m. ASTM C881/C881M Standard Specification for Epoxy-Resin-Base Bonding Systems for Concrete.

n. ASTM C928/C928M Standard Specification for Packaged, Dry, Rapid-Hardening Cementitious Materials for Concrete Repairs.

o. ASTM C1059/C1059M Standard Specification for Latex Agents for Bonding Fresh To Hardened Concrete.

p. ASTM C1064/C1064M Standard Test Method for Temperature of Freshly Mixed Hydraulic-Cement Concrete.

q. ASTM C1702 Standard Test Method for Measurement of Heat of Hydration of Hydraulic Cementitious Materials Using Isothermal Conduction Calorimetry.

r. ASTM E329 Standard Specification for Agencies Engaged in Construction Inspection, Testing, or Special Inspection.

s. ASTM E1745 Standard Specification for Plastic Water Vapor Retarders Used in Contact with Soil or Granular Fill under Concrete Slabs.

3. American Association of State Highway and Transportation Officials (AASHTO):

a. AASHTO M182 Standard Specification for Burlap Cloth Made from Jute or Kenaf and Cotton Mats.

4. Washington State Department of Transportation (WSDOT):

a. WSDOT Standard Specifications for Road, Bridge, and Municipal Construction.

5. City of Seattle:

a. Standard Specifications for Road, Bridge, and Municipal Construction.

B. Definitions:

1. Mass Concrete: Structural concrete is defined as mass concrete when the minimum cross sectional dimension is equal to or greater than 4 feet, or when Type III cement, accelerating admixtures, or cementitious materials in excess of 660 lb/yd3 of concrete are used. Concrete used in shafts meeting drilled shaft concrete mix requirements, a maximum temperature at placement of 70 degrees Fahrenheit, and a minimum amount of 25 percent fly ash or 35 percent slag are

excluded from mass concrete requirements. Exemptions from mass concrete are subject to review and approval process by the Resident Engineer.

1.03 SUBMITTALS

A. Submit

1. Construction Work Plan including provisions for hot weather concreting and curing, cold weather concreting and curing, and wet weather concreting and curing. Provide concrete vibration procedure and description of methods to prevent the formation of aggregate pockets.

2. Shop Drawings for Cast-In-Place Prestressed Concrete: Drawings must be in accordance with WSDOT Standard Specifications Section 6-02.3(26)C, except that submit the drawings to Resident Engineer and not WSDOT as indicated in the submittal procedures.

3. Thermal Control Plan: Mass Concrete

4. Concrete Pre-Pour Hold Point Checklist, see Article 1.04, in this specification.

B. Transmit:

1. For each manufactured product, submit:

a. Manufacturer's Product Data showing conformance with the requirements of this Section.

b. Material Data and Safety Sheets.

c. Manufacturer’s written instructions for storage, handling, and installation

2. Qualifications:

a. Certificate of accreditation for Independent Testing Laboratory Technicians in accordance with ASTM E329 for technical competence to perform specific tests required.

b. Qualifications of concrete placement technicians in accordance with Article 1.04A.

3. Placement Records: Report the location in the finished work of each concrete class, and the start and completion times of each batch of concrete placed.

4. Field Quality Control inspection and test reports and documents:

a. Concrete slump, air content, and temperature results.

b. Concrete compressive strength test results.

c. Concrete truck batch tickets in conformance with ASTM C94/C94M. Include any modifications to water or admixture volumes from the original mix design.

d. Thermal control records

e. Qualifications of Independent Testing Laboratory Technician

1.04 QUALITY ASSURANCE

A. Concrete Placement Personnel: The Contractor's personnel responsible for carrying out concrete activities must possess skills and prior experience in the specific type of work necessary to effectively perform the responsibilities for concrete placement. Only technicians whose qualifications have been reviewed by the Resident Engineer are permitted to be assigned to carry out concrete control activities.

B. Construction Work Plan: Include storage descriptions of methods, materials, labor, and equipment used in:

1. Forming, conveying, placing, curing, and protecting cast-in-place concrete. Provide concrete vibration procedure and description of methods to prevent the formation of aggregate pockets.

2. Sampling and testing cast-in-place concrete.

3. Hot weather concreting, cold weather concreting, and wet weather concreting.

C. Thermal Control Plan: Develop plan with concrete supplier describing means and methods of monitoring internal and differential temperature of mass concrete, and mitigating damage to concrete due to heat of hydration of the cement and attendant volume changes. Include the following:

1. Concrete mix designs.

2. Duration and methods of curing.

3. Methods of controlling interior and differential concrete temperatures.

4. Methods of applying immediate corrective action should the temperature limits be exceeded.

5. Damage from thermal cracking, degradation of concrete strength, or delayed ettringite formation.

6. Temperature monitoring system. Include system description, sensor types and locations, and manufacturer's product information. Furnish readout device with chart recorder. Furnish sample thermal control report.

7. Method of sensor installation, connection to readout device, protection during placement and curing, reading, and decommissioning.

8. Indicate on the concrete thermal control plan which combinations of ambient temperature, concrete temperature, and R-value of the thermal blanket are acceptable for field use. Include checking the thermal control plan as part of the pre-pour checklist. Concrete is only accepted if the combination of concrete temperature and ambient temperature is within the combination that will not exceed the maximum core temperature and maximum differential temperature.

D. Hold points for inspection prior to concrete placement for verifying conformance of reinforcement and formwork include:

1. Substrate preparation.

2. Formwork and blockout installation and release agent application.

3. Reinforcement, embedment for anchors and Mechanical Electrical and Plumbing (MEP), post-tensioning, waterstop product installation.

4. Cleanliness.

5. Thermal Control application.

6. Concrete mix design verification.

7. Concrete Testing.

E. Independent Testing Laboratory technicians must have ACI Grade I Concrete Field Testing Technician Certification.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Ready Mix Concrete: Section 03 05 15 - Cement Concrete.

B. Store and handle manufactured products in conformance with manufacturer’s written instructions.

PART 2 - PRODUCTS

2.01 PRODUCTS

A. Patching Mortar: ACI 503.2-503.4 for Epoxy Mortar.

B. Epoxy Adhesive: ASTM C881/C881M:

1. Type II for non-load-bearing concrete, Type V for load-bearing concrete.

2. Select grade and class by project conditions and requirements.

C. Damp Curing Materials:

1. Waterproof Sheet Materials: ASTM C171 waterproof paper with white paper face, polyethylene film pigmented white or white burlap-polyethylene sheeting.

2. Burlap: AASHTO M182, class or weight suitable for the use and location.

D. Curing Compound: ASTM C309, liquid membrane-forming curing compound:

1. Type 1 for concrete not exposed to sunlight, Type 1-D with white fugitive dye for concrete exposed to sunlight.

2. Class A or B as appropriate for use and location.

E. Patching Materials Other Than Cement:

1. Cement mortar modified with a latex bonding agent conforming to ASTM C1059/C1059M Type II.

2. Epoxy mortars and epoxy compounds that are moisture-insensitive during application and after curing, that embody an epoxy binder conforming to ASTM C881/C881M, Type III. Select type, grade, and class appropriate for the application.

3. Non-shrink grout: Section 03 62 00 - Non-Shrink Grout.

4. Packaged, dry concrete repair materials conforming to ASTM C928/C928M

F. Evaporation Retarder:

1. Eucobar by Euclid Chemical.

2. Evapre by W. R. Meadows.

3. Aquafilm by Dayton Superior.

G. Vapor Retarder:

1. Carlisle Coating and Waterproofing, Inc.; Blackline400.

2. Stego Industries, LLC; Stego Wrap 15 mil Class A.

3. Grace Construction Products, W.R. Grace & Co.: Florprufe 120.

4. Raven Industries Inc.: Vapor Block 15.

5. Reef Industries, Inc.: Griffolyn Type-105.

H. Sealers:

1. Reference Specification Section 07 19 10 - Water and Graffiti Repellents.

2. Silane Sealer with 40 percent solids:

a. Baracade Silane 40 by Euclid Chemical.

b. MasterProtect H 440HZ by BASF.

2.02 MATERIALS

A. Portland and Hydraulic Cement for Site-Mixed Repair Materials:

1. ASTM C150/C150M, type and brand to match cement used in concrete to be repaired.

2. ASTM C595/C595M, type and brand to match cement used in concrete to be repaired.

3. Provide white Portland Cement where required to match surrounding concrete.

B. Fine Aggregate for Site-Mixed Repair Materials:

1. For Bonding Grout: ASTM C33/C33M washed clean sand passing a Number 30 sieve.

2. For Patching Mortar: ASTM C33/C33M washed clean, graded fine aggregate of suitable size for areas to be repaired. Aggregate up to Size Number 8 is permitted to be used for repair of larger defects.

2.03 MIX DESIGNS

A. Mix Designs: Section 03 05 15 - Cement Concrete.

2.04 MEASURING, BATCHING, AND MIXING

A. Measure, batch and mix Cement Concrete in conformance with ASTM C94:

1. Use central-mixed concrete transported to the jobsite in truck mixers.

2. Use truck mixers equipped with:

a. Automatic device for recording number of revolutions of drum prior to completion of mixing operation.

b. Either accurately calibrated water tanks or water meters.

PART 3 - EXECUTION

3.01 PREPARATION

A. Notification: Prior to each concrete placement:

1. Notify the Resident Engineer at least 24 hours prior to actual placement, and not later than 3 pm on the day prior to placement.

2. Notify the Resident Engineer at least 48 hours prior to actual placement when schedules require concrete placement at times other than normal working hours or for mass concrete pours.

3. Notify the Resident Engineer of the location of the placement and the concrete mix to be placed.

B. Prior to placement, verify the following:

1. Formwork installation conforms to Section 03 11 00 - Concrete Forming.

2. Reinforcing placement conforms to Section 03 20 00 - Concrete Reinforcing.

3. Embedded items are located correctly and secured to resist movement.

4. For concrete cast on earth, also verify the subgrade is well drained; free of debris, free of frost and ice; and moist with no muddy spots, soft spots, or ruts.

5. Configuration of mild steel and post-tensioning allow for concrete flowability and consolidation.

C. Topping Slab:

1. Topping applied to fresh concrete: Do not begin placement of topping until water ceases to rise to surface, and water and laitance have been removed from base slab surface.

2. Topping applied to hardened concrete: Remove dirt, loose material, oil, grease, paint and other contaminations, and leave a clean surface.

D. Construction Joints:

1. Locate construction joints as indicated on the Issued for Construction Documents, and according to Section 03 11 00 - Concrete Forming.

2. Form construction joints straight and as inconspicuous as possible, and in vertical and horizontal alignment with the structure.

3. All joints must be horizontal, vertical, or perpendicular to the main reinforcement.

4. Do not use an edger on any construction joint, and remove any lip or edging prior to adjacent pour.

5. Install waterstops in conformance with Section 03 15 13 - Waterstops.

6. Before placing fresh concrete against cured concrete, remove all laitance, thoroughly clean the cured surface, and intentionally roughen the surface to a full amplitude of approximately 1/4 inch.

E. Obtain acceptance of preparation from the Resident Engineer and special inspection firm prior to placement.

F. Waterproofing Membrane: Where concrete is to be placed over a waterproofing membrane, obtain acceptance of the membrane integrity from the Resident Engineer prior to concrete placement.

G. Weather Considerations:

1. Wet Weather: Do not place concrete while rain, sleet, or snow is falling unless protection is provided. Do not allow rain, sleet or snow to increase mixing water or damage unformed surfaces.

2. Hot Weather: Conform to ACI 305R.

3. Cold Weather: Conform to ACI 306.1.

3.02 MEASURING, BATCHING AND MIXING

A. Measure, batch and mix Cement Concrete in conformance with ASTM C94/C94M:

1. Use central-mixed concrete transported to the jobsite in truck mixers.

2. Use truck mixers equipped with:

a. Automatic device for recording number of revolutions of drum prior to completion of mixing operation.

b. Either accurately calibrated water tanks or water meters.

3.03 DELIVERY

A. Refer to Section 03 05 15 - Cement Concrete.

3.04 ADJUSTMENT

A. For slump adjustment, refer to Section 03 05 15 - Cement Concrete.

3.05 PLACEMENT

A. Conveying:

1. General:

a. Convey concrete rapidly from mixer to the place of final deposit using methods that prevent segregation and loss of ingredients, and will ensure the required quality of concrete.

b. Do not use aluminum pipes or chutes.

c. Conform to ACI 304R.

2. Pumping:

a. Conform to ACI 304.2R.

b. Use pumping equipment that permits placement rates that avoid cold joints and prevent segregation in discharge of pumped concrete.

c. Support pump hoses so that reinforcement is not moved from its original position.

B. Depositing:

1. Place concrete continuously in one horizontal layer or in several horizontal layers with fresh concrete deposited over previous placements that are still plastic.

2. Do not place concrete that has surface-dried, partially hardened, or contains foreign material.

3. Do not drop concrete freely through reinforcing which may cause segregation.

4. Do not drop concrete freely more than 5 feet. When placing vertical sections of greater heights, use openings in the form, elephant trunks, tremies, or other approved devices to reduce the free drop.

5. Placement Using Tremie Methods: Place concrete in or under water in conformance to ACI 304R.

6. When a truck is being sampled, do not place concreteuntil tests demonstrate the concrete conforms to temperature, air content, and slump requirements.

C. Consolidating:

1. Consolidate concrete by mechanical vibration in conformance with ACI 309R.

2. Thoroughly work concrete around reinforcement and embedded items and into corners of forms to eliminate air and rock pockets. Insert and withdraw the vibrator vertically at uniform spacing over the entire area of the placement. Space the distance between insertions such that the influence zones of each insertion overlap. Do not drag vibrators to move concrete horizontally.

3. Drop the vibrators to a depth as to ensure consolidation towards the bottom of all vertical elements and through congested areas. Drop vibrators to depth multiple times to bottom of elements. Keep vibrators in position for a sufficient amount of time to consolidate.

4. Use internal vibrators of the largest size and power that can properly be used in the Work. Maintain vibrators and provide sufficient back-up units on site.

5. Thoroughly and Systematically vibrate concrete placed around waterstopsto avoid air entrapment, and provide positive contact between the waterstop and concrete. Prior to completion of the concrete placement, clean the exposed portion of the waterstopof all foreign objects to ensurepositive contact between the waterstop and concrete.

6. Provide sufficient windows in the forms or limit the forms in height to allow visual observation of the concrete such that the vibrator operator can observe the concrete being consolidated to ensure good quality workmanship. Conduct vibration using competent, skilled, and experienced workers.

3.06 CURING AND PROTECTION:

A. Evaporation Retarder: Apply evaporation retarder to unformed concrete surfaces for stations and garages according to manufacturer’s written instructions after placing, screeding, and bull floating or darbying concrete, but before float finishing.

1. Evaproation Retarder is not required when the Curing Procedures demonstrate that moisture loss will not exceed 0.2 lb/sq.ft x h (1 kg/sq.m x h) before and during finshing operations. Base such determination upon concrete mix characteristics and ambient environmental conditions at time of placement.

B. Curing Unformed Concrete Surfaces at Station Platforms:

1. Cure the concrete surfaces in accordance with the WSDOT Standard Specifications Section 6-02.3(11)B, except as noted below:

a. The wet curing requirement as described must remain in place for at least 7 - consecutive calendar days.

b. Curing concrete by spraying curing compound only is not allowed for station platforms.

C. Curing Unformed Concrete Surfaces other than Station Platforms:

1. Apply evaporation retardant, immediately after placing, in accordance with manufacturer’s instructions.

2. Apply curing compound in accordance with manufacturer’s instructions.

D. Curing Formed Concrete Surfaces:

1. Keep absorbent wood forms wet until they are removed.

2. If formwork ties are loosened during curing period, moist cure after loosening forms. If removing forms before the end of curing period, apply curing compound within 10-minutes after formwork is removed.

3. Do not loosen formwork ties prior to minimum time for form removal per Table 03 11 00-A in Section 03 11 00 - Concrete Forming.

E. Protection:

1. Immediately after placing, protect concrete from premature drying, excessively hot or cold temperatures, mechanical injury, and staining.

2. Protect concrete during the curing period from mechanical and physical stresses due to heavy equipment movement, avoid subjecting the concrete to load stress, load shock, or excessive vibration.

3. Where concrete surfaces will receive architectural finishes, such as clear or penetrating pigmented sealer/densifier, resilient floor coverings or paint, ensure membrane-forming curing compound does not leave a coating or residue that will impair application or bond of sealers, adhesives, paints, and coatings with concrete.

4. Comply with ACI 301 and ACI 306.1 for cold weather protection during curing.

5. Comply with ACI 301 and ACI 305.1 for hot-weather protection during curing.

F. Parking Garages:

1. See Specification Section 07 19 10 - Water and Graffiti Repellents for sealer.

2. Cure concrete in accordance with ACI 301, including duration of curing period.

3.07 REPAIR OF SURFACE DEFECTS

A. General:

1. Where the surface is to be textured, repair tie holes and surface defects before texturing.

2. Manufactured repair materials are permitted in lieu of site-mixed repair materials. Apply manufactured repair materials in conformance with manufacturer’s printed instructions.

3. Repair concrete damage caused by construction activities, such as accidental equipment impact, temporary anchor bolts and construction equipment connections.

4. Repair all surface defects greater than 1/4 inch.

5. See Specification Section 03 35 00 - Concrete Finishing for concrete finishing requirements.

6. Prior to placement of repair material, surfaces must be saturated with clean water. Concrete substrate to be in a saturated, surface dry (SSD) condition with no standing water, minimum of four (4) hours prior to placing repair material. Bonding agents or scrub coats are be permitted based on the manufacturers requirements of the repair material.

7. Patching Mortar Aggregate: ASTM C33/C33M, washed clean, graded fine aggregate of suitable size for areas to be repaired. Clean coarse aggregate up to Size Number 8 are permitted be added for repair of larger pockets and voids.

8. Commerical Patching Mortar: Latex-modified cement mortar is permitted to be furnished if appropriate for the use.

9. Pre-Approved Repair Procedures do not substitute the requirements of Section 01 45 00 – Quality Control for non-conformity processes. Document defects in Non-Conformance Report (NCRs) and submit to the Resident Engineer for approval..

B. Site-Mixed Repair Materials:

1. Patching Mortar:

   a. Use same materials as the concrete to be patched with no coarse aggregate. Do not use more than one part cement to 2-1/2 parts sand.

   b. For repairs in exposed concrete, substitute white cement for a portion of the gray cement to produce a mix matching the surrounding concrete color when dry. Determine the proportion of white cement by trial mixes and test areas, prior to repair of actual defective areas.

C. Repair of Tie Holes:

1. Fill all tie holes, unless otherwise noted.

2. If cement patching mortar is used for plugging, clean and dampen tie holes before application.

3. At stations, form tie plugs must be used per Section 03 11 00 – Concrete Forming.

D. Removal of surface stains and deposits.

1. Remove stains, rust, efflorescence, and surface deposits considered objectionable by the Resident Engineer.

3.08 THERMAL CONTROL

A. Limit concrete absolute maximum allowable internal temperature to 160 degrees Fahrenheit. Limit maximum differential temperature to 35 degrees Fahrenheit, between the middle of the placement and at a point 2 inches interior to the surface.

B. Demonstrate that concrete temperatures do not exceed the specified limits:

1. Test concrete temperatures in conformance with ASTM C1702.

2. Record internal and surface temperatures:

a. Hourly until internal concrete temperature has dropped to less than 90 percent of the maximum recorded.

b. As necessary until trend indicates internal and surface concrete temperatures are converging.

3. Provide chart recorder to document temperatures and submit records as part of Article 1.04, in this specification.

3.09 FIELD QUALITY CONTROL

A. Independent Testing Laboratory: Use an Independent Testing Laboratory to perform the following:

1. Observe concrete batching and mixing operations.

2. Record all concrete batched

3. Record all concrete delivered to the project

4. Collect and check concrete truck batch tickets

5. Visually inspect concrete placement

6. Sample and test concrete

7. Obtain drilled cores of concrete, if required by the Resident Engineer

8. Observe installation of temperature measurement devices in mass concrete, manage quality of recording process, and access and review electronic temperature data.

9. Prepare reports on all inspection and test results

B. Strip concrete formwork and inspect concrete quality prior to the next pour of the same element. Strip formwork for concrete when there is no next pour no later than one week after the required time period to ensure quality inspection in time.

C. Provide additional labor, materials, or equipment required to assist the Independent Testing Laboratory in obtaining and handling samples at the site.

D. Provide and maintain for the sole use of the Independent Testing Laboratory adequate facilities for safe storage and proper curing of concrete test specimens on site for initial curing.

E. Confirm concrete curing time is maintained for required time.

F. Concrete Sampling:

1. Obtain composite samples in compliance with ASTM C172. Select the trucks or batches of concrete to be tested on a random basis. Obtaining samples at the truck is permitted if the Contractor determines the slump loss during pumping by comparing the slump at the truck with the slump at the end of the pumpline using the comparative test and the Contractor establishes the slump requirement at the truck based on the slump loss (See ACI 301 Optional Requirements Checklist Section 4.2.2.2).

2. Obtain at least one composite sample for the first batch of concrete, and then for each 100 cubic yards, or fraction thereof, of each concrete mixture placed in any one day. When the total quantity of a given concrete mixture is less than 50 cubic yards, test the first batch of concrete, and at least one other batch.

3. Determine slump of each sample in compliance with ASTM C143/ C143M.

4. Determine air content of each sample in compliance with ASTM C231/ C231M.

5. Determine temperature of each sample in compliance with ASTM C1064/ C1064M.

6. Do not place concrete before slump, temperature, and air content tests demonstrate concrete is within acceptable limits.

7. Conduct compressive strength tests of each sample in compliance with the following:

a. Mold and cure three cylinders in compliance with ASTM C31/ C31M. Record any deviations from the ASTM requirements in the test report. It is optional for the Contactor to make additional cylinders

b. Test cylinders in compliance with ASTM C39/ C39M. Test one specimen at seven days for information and two specimens at 28 days for acceptance, unless otherwise specified.

G. Evaluation and Acceptance of Tests:

1. Acceptance of Concrete:

a. The compressive strength tests results for acceptance of each sample shall be the average of the compressive strengths from the two specimens tested at 28 days.

b. If one specimen in a sample shows evidence of improper sampling, molding, or testing, discard the specimen and consider the strength of the remaining cylinder to be the test result.

c. If both specimens in a sample show any defects, both specimens must be discarded.

d. Compressive strength tests will be considered acceptable if the average compressive strength of all 28-day specimens of three consecutive sample tests are equal to or exceed the specified 28-day compressive strength, and if no individual specimen compressive strength is more than 300 pounds per square inch below the specified 28-day compressive strength.

2. Test Cores: If concrete strength is not considered acceptable, or if there is a likelihood of low strength concrete, a significant reduction in load-carrying capacity or an absence of desired durability in the concrete, the Resident Engineer shall determine if test cores shall be drilled for determination of in-place strength:

   a. Obtain and test specimens in conformance with ASTM C42. Take three cores from each area as directed by the Resident Engineer.

   b. Test cores will be considered acceptable if the average of the three cores is equal to at least 85 percent of the specified 28-day compressive strength and no single core is less than 75 percent of the 28-day compressive strength. Locations represented by erratic core strengths are permitted to be retested at the direction of the Resident Engineer.

   c. Perform rebar scanning when determining core locations..

   d. Submit coring and core repair plan for the Resident Engineer's review and approval.

3. Non-Conformance Report (NCR): If concrete strength is not considered acceptable, or if there is a likelihood of low strength concrete, a significant reduction in load-carrying capacity or an absence of desired durability in the concrete, the Contractor must submit a Non-Conformance Report (NCR) to Resident Engineer for ST's review and approval including ST structural group. Submit the NCR as soon as possible if signs of low strength concrete are noticed after the formwork removal, and/or the seven day strength test is low.

END OF SECTION

SECTION 03 30 13

CONCRETE AERIAL GUIDEWAY DECKING

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for the concrete placement, finishing, texturing, and curing of the track slab associated with the aerial guideways.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents.

B. Washington State Department of Transportation (WSDOT):

1. WSDOT Standard Specifications for Road, Bridge, and Municipal Construction.

1.03 SUBMITTALS

A. Transmit

1. Qualifications for finishers.

2. Equipment/Tools List: Provide a list of equipment and tools to be used.

1.04 QUALITY ASSURANCE

A. Finishers Qualifications: Finishers having completed work on at least two projects in the last five (5) years that have been accepted by WSDOT or Sound Transit without rework.

1.05 PRECONSTRUCTION MEETING

A. Hold a preconstruction meeting 5 to 10 working days before placing concrete in accordance with WSDOT Standard Specifications Section 6-02.3(10)A.

PART 2 - PRODUCTS

2.01 MATERIALS - GENERAL

A. Use the materials as indicated on the Issued for Construction Drawings and conform to requirements in other Sections.

PART 3 - EXECUTION

3.01 GENERAL

A. Perform the Work described in this Section in accordance with WSDOT Standard Specifications Section 6-02.3(10), unless specified otherwise on the Issued for Construction documents.

3.02 SCREED RAIL SUPPORTS

A. For screed rails, perform the Work in accordance with WSDOT Standard Specifications Section 6-02.3(10)B.

3.03 FINISHING EQUIPMENT

A. The finishing equipment must conform to the applicable provisions of WSDOT Standard Specifications Section 6-02.3(10)C.

B. The plinth dowel bar or other objects on the deck are not to be impacted by finishing equipment

3.04 CONCRETE PLACEMENT, FINISHING, AND TEXTURING

A. Perform the concrete placement and finishing Work in accordance with WSDOT Standard Specifications Section 6-02.3(10)D, except as noted below:

1. Perform the concrete texturing work in accordance with concrete finishing requirements as stated in the Issued for Construction Documents.

2. Do not need to follow the 10-foot straightedge requirement for flatness.

3.05 CURING CONCRETE

A. Cure the concrete surfaces in accordance with the WSDOT Standard Specifications Section 6-02.3(11)B, except as noted below:

1. The wet curing requirement as described must remain in place for at least 7 consecutive calendar days.

2. Curing concrete guideway deck by spraying curing compound only is not acceptable.

END OF SECTION

SECTION 03 30 23

CAST-IN-PLACE SEGMENTAL CONCRETE BOX GIRDER

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for the construction of cast-in-place segmental concrete box girders associated with aerial guideways, and is in accordance with design, dimensions, and details shown in the Issued for Construction Drawings and in accordance with WSDOT Standard Specifications as amended in this specification.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. American Association of State Highway and Transportation Officials (AASHTO):

   a. AASHTO LRFD Bridge Construction Specifications.

2. American Concrete Institute (ACI):

   a. ACI 117 Specification for Tolerances for Concrete Construction and Materials and Commentary.

   b. ACI 318 Building Code Requirements for Structural Concrete and Commentary.

3. American National Standards Institute/American Welding Society (ANSI/AWS):

   a. ANSI/AWS D1.4 Structural Welding Code – Reinforcing Steel.

4. American Society for Testing and Materials International (ASTM):

   a. ASTM C1074 Standard Practice for Estimating Concrete Strength by the Maturity Method.

5. Washington State Department of Transportation (WSDOT):

   a. WSDOT Standards Specifications for Road, Bridge, and Municipal Construction, M41-10.

   b. WSDOT Bridge Design Manual, M23-50.

6. Post-Tensioning Institute (PTI) and American Segmental Bridge Institute (ASBI):

   a. PTI/ASBI M50.3 Guide Specification for Multistrand and Grouted Post-Tensioning.

   b. PTI/ASBI M55.1 Specification for Grouting of Post Tensioned Structures.

7. Comité Euro-International de Béton-Fédération Internationale de la Précontrainte (CEB-FIP):

a. CEB-FIP Model Code 1990.

B. Definitions:

1. Balanced Cantilever Erection: a method by which the segments are sequentially placed alternately on either side of the pier, cantilevering to a point where a closure joint is cast.

2. Casting Curve or Casting Curve Geometry: The curve of casting geometry that must be followed in order to achieve the theoretical bridge profile and alignment after all the final structural and time dependent (creep and shrinkage) deformations have taken place. The casting curve is a combination of the theoretical bridge geometrical profile grade, alignment, and the camber.

3. Camber: The amount by which the concrete profile at the time of casting must differ from the theoretical geometric profile grade in order to compensate for all structural dead load, post-tensioning, all long-term time dependent deformations (creep and shrinkage) including all the intermediate erection stages and effects (the opposite of deflections).

4. Segment: A modular section of the superstructure and substructure consisting of a certain cross-section shape and length, as detailed on the Design Plans.

1.03 SUBMITTALS

A. Submit:

1. Construction Work Plan:

a. In advance of the start of construction operations, submit to the Resident Engineer a Construction Work Plan for approval that includes complete details, information, and all applicable drawings, materials, and procedures the Contractor proposes for use in constructing that portion of the structure for which the information is furnished.

b. Include a step-by-step procedure and must provide the anticipated time for each construction activity.

c. Work over traffic must include the proposed work schedule, durations, night activities over traffic, precautions for work performed over traffic, and any sidewalk, lane or roadway closures needed to perform the work. The work plan must also include a drainage plan.

2. Erection Manual:

a. In advance of the start of construction operations, submit to the Resident Engineer an Erection Manual sealed by a Professional Engineer licensed in the State of Washington for approval that includes:

1) Complete description of the proposed procedure and sequence of erection

2) Complete details, information, and all applicable drawings, materials, and procedures.

3) Schedule of the timing.

4) Sequence of segment.

5) Curing procedures.

6) Stressing and grouting of post-tensioning.

7) Horizontal and vertical alignment of the cantilever tip.

8) Sequence of constructing cast-in-place closures between spans.

9) Positions and weights of equipment and stored materials at each stage.

10) Effects of erection methods over traffic.

b. Modifications of the structure for erection purposes is permitted with the approval of the Resident Engineer, provided the modifications demonstrate that the details will have no adverse effect on the complete structure.

3. Geometry Control Work Plan:

a. In advance of the start of the casting operation, submit the Geometry Control Work Plan sealed by a Professional Engineer licensed in the State of Washington to the Resident Engineer for approval.

b. The Geometry Control Work Plan must outline the proposed method for surveying work points, establishing formwork set elevations, monitoring as-cast versus theoretical deck shape and elevations, and correcting any deviations from the theoretical vertical profile and horizontal alignment. The plan must include:

1) Regular monitoring plan of the superstructure deflections beginning with the construction of the pier table and concluding with the last cantilever field section.

2) Required measuring equipment, procedures, and the location of control points to be established on each segment.

3) Verification that the Erection Manual is compatible with the Geometry Control Work Plan. If the Contractor proposes a change to a construction procedure that was previously approved, develop a new casting curve and submit for review and approval by the Resident Engineer. The submittal of the revised casting curve must include a proposed method(s) and location(s) for transitioning between the current curve in use and the submitted proposed new curve.

4) Casting curves that include the theoretical geometric horizontal alignment, profile grade, and superelevation appropriately combined with the camber.

4. Camber Curve:

a. In advance of the start of construction operations, submit calculations showing the methods and parameters used in the camber curve development, sealed and signed by a Professional Engineer licensed in the State of Washington, to the Resident Engineer for approval. The Engineer must have experience in preparing a camber curve for a cantilever segmental cast-in-place post-tensioned concrete box girder bridge within the past five years.

b. The camber curve must be of sufficient accuracy to allow the determination of control point settings for accurately casting the segments as outlined in the Geometry Control Work Plan. The preparation of the camber curve must recognize all deviations from straight line and deformations due to the final required alignment and due to dead load, erection loads, and post-tensioning stresses including secondary moments, creep, and shrinkage.

c. Theoretical geometry must include the effects of:

1) Deformations from dead load and construction live load from form travelers and other staged construction materials and equipment, and the expected deformations of the form traveler itself from the wet weight of concrete.

2) Post-tensioning including the effects of secondary moments.

3) Creep and shrinkage.

4) Final bridge profile and alignment.

5) Stage after superimposed dead load when plinths, track and emergency guardrail are installed after falsework is removed.

d. Base the camber curve on the schedule and sequence as outlined in the Erection Manual.

e. For each segment or closure pour, provide the camber curve for:

1) Unloaded formwork launched to casting position (Set-Up).

2) After concrete is placed (As-Cast).

3) After post-tensioning is stressed.

f. Compute the preparation of the camber curve deformations due to creep and shrinkage and the concrete modulus of elasticity using the CEB-FIP Model Code 1990.

g. Include the following items in the camber curve submittal:

1) The modulus of elasticity of superstructure concrete at 28 days, $E_{C.}$

2) The ultimate creep coefficient, Ø.

3) The shrinkage coefficient, $E_{SH.}$

5. Temporary Construction:

a. In advance of the start of construction operations, submit calculations for temporary shoring or other temporary construction that is not fully detailed in the Issued for Construction Drawings and which will be subject to calculated stresses. Design of falsework and/or erection equipment that is not fully detailed in the Issued for Construction Drawings or Erection Manual must be sealed and signed by a Professional Engineer registered in the State of Washington. Include verification of the permanent structure for stresses imposed by the falsework and/or erection equipment with these design calculations.

6. Shop Drawings:

   a. Working drawings must include stress sheets, shop drawings, mild steel reinforcement placement drawings, falsework plans, form drawings, and any other supplement plans or similar data required of the Contractor.

   b. The mild steel reinforcement placement drawings must include, in addition to that required by concrete reinforcing requirements as state in the Issued for Construction Documents, steel placement plans for localized stresses due to traveler and other temporary construction loads.

   c. The detailed, integrated shop drawings must include but are not limited to the following:

      1) Fully and accurately dimensioned views showing the geometry of the segment including projections, recesses, notches, openings, blockouts, and other similar features. Each segment must be drawn separately for clarity.

      2) Details of mild steel reinforcing size, grade, spacing, and location, including all mild steel reinforcing required in addition to that shown in the Issued for Construction Drawings. The reinforcing steel shown in the Issued for Construction Drawings is the minimum steel required. Detail additional reinforcing steel to be placed in the region immediately surrounding each anchorage device as specified by the anchorage system manufacturer and additional reinforcing steel required to support temporary construction works on the shop drawings.

      3) Details and locations of all other items to be embedded in the segments such as inserts, lifting devices, and similar items.

      4) Complete details of the casting system to be used, including the forms, traveler, falsework, foundations, and geometry controls.

      5) Complete details of the catchment structure for protection of traffic. The catchment structure details must include horizontal and vertical clearances to sidewalks or roadways open to traffic during construction of each cast-in-place segment.

   d. Post-Tensioning shop drawings must include but are not limited to the following:

      1) Details of the post-tensioning tendons, post-tensioning system, and grouting procedures as required by post-tensioning requirements as state in the Issued for Construction Documents.

      2) Tendon plan showing horizontal locations at all points. Detail horizontal curvature of tendons at blockout and anchorages. Show all openings in slabs and beams.

      3) Tendon profiles showing chair heights and locations, and any required additional placement steel not shown in the Issued for Construction Drawings. Show the location of each tendon including the locations of grout ports and drains and the method and location of tendon supports.

      4) Details of reinforcing around stressing pockets, anchorages, and closures, or where interference with post-tension tendons occur.

5) Reinforcing details necessary to provide distribution of the anchorage forces.

6) Calculated elongation of each tendon at jacking point. Include calculations with shop drawing submittal. Submit calculations sealed by a Professional Engineer licensed in the State of Washington. Indicate the procedure for and sequence of stressing, losses due to anchorage, seating, elastic shortening, creep, shrinkage, relaxation, friction, and wobble used to determine the effective prestress force and anchor reinforcing. The Professional Engineer must have a minimum of 5 years of experience performing similar post-tensioning design.

7) Details and location of all other items such as post-tensioning hardware and similar items.

8) Additional mild reinforcing required to support tendon ducts and at anchorages as outlined by post-tensioning supplier.

e. Longitudinal Construction Analysis: Longitudinal Construction Analysis must include effects of construction loading and be sealed by a Professional Engineer licensed in the State of Washington.

f. Transverse Construction Analysis: Transverse Construction Analysis must include effects of construction loading and be sealed by a Professional Engineer licensed in the State of Washington.

B. Transmit:

1. Complete details of the casting system sealed by a Professional Engineer licensed in the State of Washington. Include the forms, traveler, falsework, and foundations.

1.04 QUALITY ASSURANCE

A. Geometry Control Technicians

1. The Contractor’s personnel responsible for carrying out geometry control activities during casting of concrete superstructure segments must possess skills and prior experience in the specific type of work necessary to effectively control the final geometry of the guideway. Geometry Control Technician must have a minimum of 5 years of general bridge construction experience of which 2 years must have been providing geometry control.

2. Prior to beginning work that requires geometry control measurements, submit for review by the Resident Engineer complete information establishing control activities. Only technicians whose qualifications have been reviewed by the Resident Engineer are permitted to carry out geometry control activities.

3. The Contractor’s geometry control technician must carry out all geometry control during erection of the guideway as required by these specifications.

B. Erection Superintendent:

1. The Erection Superintendent must have specific knowledge of and experience in the erection of cast-in-place segmental bridges by the balance cantilever method of construction including having prior experience supervising the operation of special erection equipment similar to the equipment required for this project. Erection Superintendent must have a minimum of 10 years of general bridge

construction experience of which 5 years must have been providing balance cantilever erection supervision.

2. Submit to the Resident Engineer evidences that establishes that the proposed the Erection Superintendent has the qualification set out in this specification. Do not start work requiring involvement of the Erection Superintendent until the Resident Engineer has reviewed this submittal and responded with written acceptance of the proposed Erection Superintendent.

3. The Erection Superintendent must be present at the erection site and supervise all critical erection phases including but not limited to:

   a. Load testing of the erection equipment.

   b. Moving of the erection equipment.

   c. Setting up the erection equipment before starting casting operations for a given cantilever.

1.05 ADDITIONAL POST-TENSIONING

A. Provide post-tensioning, in addition to that shown in the Issued for Construction Drawings, as the Contractor deems necessary to accommodate the erection procedure. Submit to the Resident Engineer for approval these proposals with complete calculations and drawings of the effect on the completed structure and at various stages of construction as part of the shop plans. The calculations and drawings must be signed and stamped by a Professional Engineer licensed in the State of Washington.

B. Detension the tendons and remove all post-tensioning added to accommodate the Contractor's erection procedure unless otherwise approved by the Resident Engineer.

C. Fill all ducts provided by the Contractor with grout in accordance with the WSDOT Standard Specifications Section 6-02.3(26)H and these specifications.

PART 2 - PRODUCTS

2.01 EQUIPMENT

A. The Contractor is solely responsible for design, fabrication, assembly, and operation of all equipment to be used for constructing the superstructure(s).

B. Certification of Temporary Equipment:

1. Inspect and certify that form-travelers or other temporary equipment are structural adequate for their intended use in the construction process. Inspection to be performed on the site at the time the equipment is fully assembled. Provide Certification in writing to the Resident Engineer fourteen (14) calendar days prior to placement of segment concrete.

2.02 MATERIALS

A. All material must be as specified in the Issued for Construction Documents.

B. Concrete: Use concrete as specified in Section 03 30 00 - Cast-In-Place Concrete, except as specifically modified in this specification.

C. Reinforcing Steel: Use mild reinforcing steel that meets the requirements of Section 03 20 00 – Concrete Reinforcing.

D. Post-Tensioning System: Use post-tensioning hardware components as specified in the approved Issued for Construction Drawings and specifications. Components are not interchangeable and must comply with the details of the approved post-tensioning shop drawings.

PART 3 - EXECUTION

3.01 PREPARATION

A. Do not begin casting of superstructure segments until the Resident Engineer approves the shop drawings, the required computations, casting manuals, concrete forms, concreting operations, and the post-tensioning system.

B. Do not operate equipment from or placed upon any part of erected superstructure at any stage of construction other than that which specifically meets the requirement of total working load, as allowed by the Issued for Construction Drawings, Erection Manual, or has the approval of the Resident Engineer. This includes the post-tensioning, jointing, jacking, grouting equipment and any other equipment or materials.

C. Work Over Traffic:

1. Anchor traveler and do not move over traffic.

2. Seal forms to prevent leaks.

3. Extend catchment structure beyond work zone using rigid material.

D. Following the placement of the first two segments of each span, the Resident Engineer will conduct a review of safety plan and quality procedures for work over traffic. Prior to placement of the third segments, modify procedures for work over traffic to address any issues identified in the review.

3.02 FORMS

A. Refer to Section 03 11 00 - Concrete Forming in addition to the following information:

1. Form all exposed formed surfaces of each element of the structure with the same material to produce similar concrete surface textures, color, and appearance. Build the details as shown on the Issued for Construction Drawings.

2. Forms must be structurally adequate to produce the segments within permissible tolerances. Incorporate the method and the necessary hardware to adjust and maintain grade and alignment. Include details of the hardware and adjustment procedure in the shop plans.

3. Check and inspect form, as necessary, to ensure proper alignment and geometric accuracy. Do not use forms that fail to meet the specified casting tolerances as outlined in Article 3.06 of this specification, until such corrections are made to product segments within the specified tolerances.

4. Where Sections of forms are to be jointed, an offset of 1/16 inch for flat surfaces, and 1/8 inch for corners and bends will be permitted. Correct offsets greater than 1/8 inch by grinding or otherwise finishing the protrusion of a 1 to 4 maximum slope.

5. The top surface of segments when finished must not deviate more than 1/4 inch from a straight edge 10 feet long placed in any horizontal position on the surface of each side of centerline.

6. Prior to longitudinal post-tensioning the Contractor is permitted to remove side forms and top slab forms on concrete which has reached sufficient strength for the application of longitudinal post-tensioning.

3.04 GEOMETRY CONTROL

A. The Contractor is responsible for geometric control of construction so that the completed structure will conform to the lines, grades, and dimensions and shown on the plans.

B. Verify the elevations and alignment of the structure prior to and after casting each segment and maintain a record of all these checks and of all adjustments and corrections made. Perform all surveying at a time that will minimize the influence of temperature and thermal gradients.

C. Measure deflections of cantilevers as construction progresses and compare with computed deflections. Correct all deviations from the required alignment by modifying the formwork geometry during the subsequent casting operations.

D. Furnish competent engineering and surveying personnel and equipment to establish and verify elevations and alignment of the structure at every stage of constructions.

E. Establish and maintain permanent benchmarks and control points throughout the casting operations. At a minimum, establish vertical control points near the center of each web and horizontal control at the center of the top slab.

F. During casting, make all correction required in the geometry of the segments from the control points established on each segment.

G. Check the as-cast elevations and alignment of the structure, after casting each segment or closure pour. Verify Geometry Control surveying at a time that will minimize the influence of temperature. Provide surveying to an accuracy of 0.01 foot. At a minimum, record the leading edges of pier table and the last three joints at the end of both cantilevers for purposes of geometry control. Maintain a record of all surveys, check readings, adjustments, and corrections.

H. The structure must have a geometric configuration at mean temperature in general conformance with the dimensions shown on the plans for the dead load condition.

I. Keep all geometry control hardware cast into segments (e.g., elevation bolts and alignment hairpins) in place during erection for reference and checking purposes. Fill the hardware void with epoxy after construction completion.

3.05 EMBEDDED ITEMS

A. Furnish and install embedded items such as ducts and anchorages for post-tensioning in accordance with the approved Issued For Construction (IFC) documents and this Specification.

B. Place reinforcing steel in accordance with the approved IFC documents and as required in this specification. Do not remove reinforcing steel to permit proper alignment of post-tensioning ducts or other embedded items without approval from the Resident Engineer. Submit for the Resident Engineer’s approval, bending or repositioning of approved IFC Drawing specified reinforcing steel to accommodate proper alignment of the post-tensioning ducts.

C. After installation in the forms, protect the end of the ducts and anchorages at all times to prevent entry of water and debris.

D. Place supporting devices for form travelers or other construction equipment incorporated in superstructure segments into the form before the concrete is cast.

E. Place post-tensioning anchors into the form before the concrete is cast.

F. Temporary blockouts to allow for later installation of anchors are not permitted.

G. Following post-tensioning, fill the recesses in accordance with the approved IFC documents and this Specification.

3.06 TOLERANCES

A. The following tolerances apply to the construction of the superstructure:

Length of Segment	± ½ inch ± 2 inch Per Cantilever
Overall Depth of Segment	± 1 inch
Overall Width (Top Slab)	± ¾ inch
Width of Web	± ¼ inch
Depth of Bottom Slab	± 3/8 inch less than 8 inches ± ½ inch greater than or equal to 8 inches
Depth of Top Slab	± 3/8 inch
Diaphragm Dimensions	± 3/8 inch

B. During set-up survey, set bulkhead ± 0.02 feet from theoretical calculated elevation.

C. Compensate the longitudinal dimensions from segment to segment for any deviations within a single segment so that the overall dimensions of the completed structure conforms to the dimensions shown in the Issued for Construction Drawings.

D. The maximum differential between the outside face of adjacent segments must not exceed 3/16 inches.

E. Transversely, the angular deviation from the theoretical slope difference between two successive segment joints must not exceed 0.001 Rad.

F. Longitudinally, the angular deviation from the theoretical slope change between two successive segments must not exceed 0.003 Rad.

G. The horizontal and vertical position of a pier table (superstructure segment which rests on a pier) must be within 1/4 inches of the longitudinal alignment, grade, and cross-slope required by the approved erection plans. The longitudinal slope must not vary more than 1/250 in ten (10) feet from that required by the approved IFC Drawings and specifications. These tolerances are for relative location of control points, not absolute location. The horizontal and vertical alignments must not deviate from the approved IFC Drawings and specifications by more than 1/8 inches.

H. Ensure the post-tensioning ducts in the final position are within the following tolerances:

1. Entrance and Exit Angles of Tendon Paths: At anchorages and/or at faces of concrete are within ± 3 degrees of the desired angle measured in any direction, and deviations in the alignment are accomplished with smooth transitions without kinks.

2. Angle Changes: At duct joints not greater than ± 3 degrees in any direction and must be accomplished with smooth transitions without kinks.

3. Anchorages: Locate anchorages within ± ¼ inches of desired position laterally and ± 1 inch along the tendon, and maintain minimum cover requirements.

4. Anchorage Confinement Reinforcement: Position anchorage confinement reinforcement in accordance with the approved shop drawings.

5. Limit duct deviation from plan location to ± 3/8 inch vertically and half a duct diameter horizontally. Maintain angle change limits to ensure smooth transition.

6. Orient grout vents entirely upwards from the tendon and drains entirely downwards from tendon.

7. Conflicts:

   a. For conflicts between the traveler embed and post-tensioning duct, the position of the traveler embed must prevail, and adjust the post-tensioning duct locally with the approval from the Resident Engineer.

   b. For conflicts between the reinforcement and post-tensioning duct, the position of the post-tensioning duct must prevail, and adjust the reinforcement locally in accordance with the drawings or with the approval from the Resident Engineer's.

3.07 CONCRETING

A. Do not deposit concrete in forms until the geometry, forms, reinforcements, ducts, and anchorage has been thoroughly inspected and checked.

B. During conveying, placement, and initial set, protect the concrete against undue drying, rise, or fall in temperature and inclement weather. Do not proceed on concrete placement until adequate measures and protection are available to prevent weather damage during conveying and placement.

C. Size and design of concrete placement equipment to permit placing concrete within the specified time. Clean all equipment at the end of each operation or workday and, just prior to reuse, check the equipment again and clean off hardened concrete and foreign materials.

D. Concrete Placement and Consolidation

1. Do not drop concrete more than four (4) feet unless contained by closed chutes or pipes. With the exception of the sloped exterior web form, do not consider the formwork as chutes. Deposit individual loads of concrete into the form and place and consolidate in the required locations. After discharge into the forms, do not move concrete from place to place within the forms by mechanical vibrators or other similar equipment.

2. Place and consolidate concrete such that tolerances are maintained with post-tensioning ducts, post-tensioning anchorages and any other embedded items, and are not damaged.

3. Place concrete in horizontal layers not more than eighteen (18) inches thick except as permitted by the Resident Engineer. Place and compact each layer before the preceding layer has taken initial set. Consolidate each layer as to avoid the formation of a construction joint with a preceding layer which has not taken initial set.

4. Vibration of the concrete to conform to Section 03 30 00 - Cast in Place Concrete with the following additions. Consolidate all concrete using approved vibrators together with any other equipment necessary to perform the work as specified. Use internal vibrators having a minimum frequency of 8,000 vibrations per minute and sufficient amplitude to consolidate the concrete effectively. Provide a minimum of two stand-by vibrators in working condition for emergency use in case of malfunction.

5. Use external vibrators for consolidating concrete when the concrete is inaccessible for adequate consolidation by internal means. Forms must be sufficiently rigid to resist displacement or damage from external vibration.

6. Immediately after completion of placing concrete, remove all accumulations of mortar splashed upon the remaining exposed reinforcement and form surfaces before concrete takes its initial set. Prevent damage or breakage of the concrete-steel bond when cleaning reinforcing steel.

7. No construction joints are permitted within a segment unless show in the Issued for Construction Drawings or approved by the Resident Engineer.

8. Mold and cure all test cylinders representing tests for removal of forms and/or falsework and for release strength under the same conditions and be subject to the same curing materials and the same weather conditions as the concrete represented. Coupled maturity meters are permitted, in accordance with ASTM C1074, to determine concrete strength prior to stressing post-tensioning and removal of forms and/or falsework.

3.08 CURING

A. Cure the top deck concrete surfaced in accordance with Specification 03 30 00 - Cast-In-Place Concrete Curing and Protection- Curing Unformed Concrete Surfaces at Station Platforms except as noted below:

1. Wet cure the top deck with presoaked burlap for the initial curing period until the initial compressive strength of three and half (3.5) ksi is achieved. Thereafter, apply a Type 2 white pigmented curing compound membrane to the top deck.

B. Cure all other elements in accordance with the Section 03 30 00 Cast-In-Place Concrete. Use a Type 1 clear compound on all formed surfaces.

C. Continue curing of the superstructure elements after the initial curing period by application of a membrane curing compound conforming to the requirements of AASHTO M 148 for all exposed surfaces. Apply curing compound in accordance with the manufacturer’s instructions. The membrane-curing compound must be of a consistency suitable for spraying at temperatures prevalent at the time of construction operations, and which forms a continuous, uniform film. It must be free from precipitated matter caused by conditions of storage or temperature.

D. For a maturity method for initial concrete strength is used, provide temperature recording devices that will provide an accurate continuous record of the curing temperature.

E. Maintain the concrete surface temperature above 50 degrees Fahrenheit until the weight supporting forms are removed. Determine the necessity for undertaking protective measures.

3.09 INITIAL DECK FINISH

A. Immediately after concrete has been placed and vibrated in a section of sufficient width to permit working, roughly level the surface, then strike off and screed such that a slight excess of concrete is carried ahead of the screed to insure filling of all low spots. Design the screed rigid enough to hold true to shape. A straight vibratory screed is permitted to be used on the deck.

B. For those elements of the structure to be constructed by balanced methods, move the screed back and forth across the concrete while one end rests on the upper surface of the form (bulkhead) and the other end on the previously cast segment.

C. Screed the surface of the concrete to produce a uniform surface, true to grade and free of voids.

D. After the water sheen has disappeared from the surface of the top slab, but while the concrete is still plastic, apply the final finish to the top slab as specified in Section 03 35 00 - Concrete Finishing.

E. Only minimum hand finishing is permitted and when the Resident Engineer deems the slab surface is being overworked, stop all hand finishing. Only minimal amounts of water is permitted to aid in the finishing process when evaporation rates affect the quality of the finish. Use the fog spray to help retard surface evaporation but must not change the water-cement ratio at the deck surface. During periods of excessive drying, maintain a cover of wet burlap or plastic sheeting on the slab at all times until final cure cover is placed.

3.10 POST TENSIONING

A. Perform post-tensioning and grouting operations in accordance with the Issued for Construction Documents.

3.11 CAST-ON FALSEWORK SPAN AND MIDSPAN CLOSURE POUR

A. The concrete must comply with the same specifications and criteria as the concrete in the segments.

B. Concrete must reach the minimum specified strength as shown in the Issued for Construction Drawings prior to stressing the continuity post-tensioning.

C. Provide tolerances for the closure pour forms as specified for erection.

D. Include the main span and back span closure methods in the Contractor's erection scheme and casting curve.

3.12 REMOVAL OF FORMS

A. After removing the forms, protect the plastic concrete from adverse weather effects.

B. Keep non-weight supporting forms in place until the concrete has reached the strength of three and half (3.5) ksi or as approved by the Resident Engineer. Keep weight supporting forms until the stressing of post-tensioning is completed in accordance with the approved IFC documents.

END OF SECTION

SECTION 03 35 00

CONCRETE FINISHING

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for the finishing of formed and unformed concrete surfaces.

B. Governance: Requirements of this Section as applicable to concrete surfaces exposed to view must govern over concrete forming and finishing.

C. Finishing treatments of floors, walls, ceiling, and other miscellaneous concrete surfaces include the following as scheduled and as indicated on the Issued for Construction Drawings.

1. CIP-0: Formed finish not exposed to view and not required to have architectural CIP concrete finish.

2. CIP-1: Formed finish for exposed to view structural elements.

3. CIP-2: Unformed finish for elevated guideway track slab surfaces, at grade track slab surfaces.

4. CIP-3: Formed finish utilizing formliners.

5. CIP-4: Broom finish medium for garage slabs.

6. CIP-5: Trowel finish for Station Platform Slabs

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. American Association of State Highway and Transportation Officials (AASHTO):

a. AASHTO M182 Standard Specification for Burlap Cloth Made from Jute or Kenaf and Cotton Mats.

2. American Concrete Institute (ACI):

a. ACI 117 Specification for Tolerances for Concrete Construction and Materials.

b. ACI 301 Specifications for Concrete Construction.

c. ACI 303.1 Standard Specification for Cast in Place Architectural Concrete.

d. ACI 303R – Guide to Cast-in-Place Architectural Concrete Practice.

e. ACI 305R Guide to Hot Weather Concreting.

f. ACI 306.1 Standard Specification for Cold Weather Concreting.

g. ACI 347.3R-13 – Guide to Formed Concrete Surfaces.

h. ACI 503.2- ACI 503.4 Three Epoxy Specification.

3. American Society for Testing and Materials (ASTM) International:

a. ASTM E303 Standard Test Method for Measuring Surface Frictional Properties Using Pendulum Tester

4. American National Standards Institute (ANSI):

a. ANSI 326.3 Dynamic Coefficient Of Friction (DCOF) Of Hard Surface Materials.

5. Washington State Department of Transportation (WSDOT)

a. WSDOT Standard Specifications for Road, Bridge, and Municipal Construction:

1) Section 6-02.3(14)C Pigmented Sealer for Concrete Surfaces.

2) Section 9-08.3 Pigmented Sealer Materials for Coating of Concrete Surfaces, color Washington Gray.

1.03 SUBMITTALS

A. Submit:

1. Shop drawings, or diagrams to scale, that indicate the location in plan and elevation of all concrete finishes. Indicate all construction, control and expansion joint locations, and form tie locations for tie holes to remain exposed.

B. Transmit:

1. Product Data: manufacturers' product data for manufactured products specified and indicated.

2. Test results per ASTM E 303 demonstrating coefficient of friction results between 0.6 to 0.8 for horizontal concrete walking surfaces.

1.04 QUALITY ASSURANCE

A. Reference quality assurance requirements in Section 03 30 00 - Cast-In-Place Concrete.

B. Source Limitations for Concrete with CIP-3 or above: Obtain each color, size, type, and variety of concrete material and concrete mixture from single manufacturer with resources to provide cast-in-place concrete of consistent quality in appearance and physical properties.

C. Mock-Ups: Provide mock-ups on site, at least 4 feet wide by 6 feet tall, of finishes of formed surfaces in exposed locations and of exposed slab finishes. Construct mockups under site conditions and meet the minimum goals as specified in ACI 347.3R-13 Paragraph 5.2.1. Demonstrate typical joints, surface finish, texture, corner details, tolerances, and standard of workmanship. Build mockups to comply with the following requirements, using materials indicated for the completed Work:

1. Build mockups in the location indicated in the Project Requirements.

2. Demonstrate curing, cleaning, and protecting of cast-in-place concrete, finishes, and contraction joints, as applicable.

3. Demonstrate penetrations and embedded items such as electrical boxes.

4. Obtain Resident Engineer's approval of mockups before casting finish concrete.

D. Subject to compliance with requirements, approved mockupsare permitted become part of the completed Work if undisturbed at time of Substantial Completion.

PART 2 - PRODUCTS

2.01 MATERIALS

A. See Section 03 30 00 - Cast-In-Place Concrete.

B. For Type 1L cement requirements, see Section 03 05 15 - Cement Concrete.

C. Skim Coat: Commercial polymer modified, Portland cement mortar for thin trowel application, specified by manufacturer for smoothing and patching walls on projects where an ultra-smooth surface is desired.

1. Basis of design product: Raeco Skimwall.

D. Sand Wash: The finish of site area exposed concrete, flatwork elements (excluding the structure) must be at a minimum “as cast” with a light to medium sand wash finish or approved equal finish. Final finish of exposed site concrete elements must be established by means of site mock-up approved by Sound Transit.

E. Sealer Materials: See Section 07 19 10 - Water and Graffiti Repellents.

PART 3 - EXECUTION

3.01 INSTALLATION

A. General:

1. In addition to ACI 303.1 limits on form-facing panel deflection, limit cast-in-place concrete surface irregularities, designated by ACI 347.3R as abrupt or gradual, as follows:

a. For exposed surfaces: SI3, ACI 117, Class A, 1/8 inch.

b. For non-exposed surfaces: SI4, ACI 117, Class B, 1/4 inch.

2. Construct forms to result in cast-in-place concrete finishes that complies with ACI 117, "Specifications for Tolerances for Concrete Construction and Materials."

3. Related Unformed Surfaces: At tops of walls, horizontal offsets, and similar unformed surfaces adjacent to formed surfaces, strike off smooth and finish with a texture matching adjacent formed surfaces.

a. Continue final surface treatment of formed surfaces uniformly across adjacent unformed surfaces unless otherwise indicated.

b. Maintain uniformity of special finishes over construction joints unless otherwise indicated.

B. For Formed Concrete Surface Category and additional requirements as defined in ACI 347.3R-13, refer to table 3.0 below:

TABLE 3.0 - FORMED SURFACE FINISH REQUIREMENTS								
Specified Finish	**Formed Concrete Surface Category (CSC)**	**ADDITIONAL REQUIREMENTS OR EXCEPTIONS TO ACI 347.3R-13**						
		Texture	**Surface Void Ratio**	**Color Uniformity**	**Surface Irregularities**	**Construction and facing-joint**	**Mock-up**	**Form-Facing Category**
CIP-0	CSC1	T1	SVR1	CU1	SI3*	CJ1	No	FC1
CIP-1	CSC3	T3	SVR3*	CU2	SI3	CJ3	Required	FC2
CIP-3	CSC3	T4*	SVR3	CU2	SI4*	CJ4*	Required	FC2
***:** Indicates an exception to standard CSC Category requirements as defined in ACI 347.3R-13, table 3.1a								

C. CIP-0: Formed Finish not exposed to View:

1. Formwork: As specified in Section 03 11 00- Concrete Forming, rough formed finish

D. CIP-1: Formed Finish (Exposed to View Structural Elements).

1. Where surface is only partially obscured from view, such as covered by intermittent cladding panels, the entire continuous surface must conform to CIP-1 requirements

2. Formwork: As specified in Section 03 11 00 - Concrete Forming, for exposed to view surfaces.

3. Finishing Operations:

a. Grout-Cleaned rubbed finish in accordance with ACI 301: Color to match concrete surface. See Section 07 19 10 - Water and Graffiti Repellents for sealer requirements.

E. CIP-2: Unformed Finish (elevated guideway and at-grade track slab surfaces):

1. Finish: Trowel and fine broom transverse to travel direction for permanently exposed top surfaces. Provide intentionally roughened surfaces under plinths and curbs.

F. CIP-3: Formed finish utilizing formliners (As indicated on Issued for Construction Drawings)

1. Formwork: As specified in Section 03 11 00 - Concrete Forming.

G. CIP-4: Broom finish, medium for garage slabs

1. Finish: Trowel and medium broom transverse to travel direction for permanently exposed top surfaces. Provide intentionally roughened surfaces under plinths and curbs.

2. Where traffic coating or similar epoxy floor finishes are required as specified in in the Issued for Construction Documents, refer to manufacturer’s instructions for surface preparation and finishing requirements.

3. Slip-Resistance: Test slabs exposed in the completed structure for the dynamic coefficient of friction between 0.6 to 0.8 per ASTM E 303.

4. Work to meet approved mock-up

H. CIP-5: Trowel Finish (Platform slab surfaces and other exposed horizontal surfaces as indicated on Issued for Construction Drawings)

1. Finish: Trowel smooth for permanently exposed top surfaces. Provide intentionally roughened surfaces under plinths and curbs.

2. Topping Slab: Where indicated, provide trowel finish topping slab to meet CIP-5 finish requirements.

3. Slip-Resistance: Test slabs exposed in the completed structure for the dynamic coefficient of friction between 0.6 to 0.8 per ASTM E 303.

4. Work to meet approved mock-up

I. Other Formed Surface Finishes (SF): After removing forms, finish each formed surface as noted below.

1. Specified Finishes: For the surfaces specified below, provide the following surface finishes in conformance with ACI 301:

a. Sump walls: SF-2.0.

b. Walls indicated to receive waterproofing or weather air-barriers: SF-1.0 unless otherwise required by waterproofing manufacturer.

c. Site walls, curbs and plaza elements: as specified in the Issued for Construction Documents.

2. Unspecified Finishes: For surfaces not specified, provide the following surface finishes in conformance with ACI 301: SF-2.0

J. Finishing Unformed Surfaces

1. Placement:

a. Place concrete at a rate that allows spreading, straight edging, and darbying or bullfloating before bleed water appears.

b. Strike smooth the top of walls, buttresses, horizontal offsets, and other similar unformed surfaces and float them to a texture consistent with the finish of adjacent formed surface.

2. Specified Finishes: For the surfaces specified below, provide the following surface finishes in conformance with ACI 301.

a. Invert Slab: Scratch finish.

b. Topping Slab: Trowel finish.

c. Housekeeping and equipment pads: Trowel finish.

3. Unspecified Finishes: for surfaces not specified above, provide the following surface finishes in conformance with ACI 301.

a. Surfaces to receive bonded cementitious materials and tile: Trowel and fine broom finish.

b. Walks; drives: steps: ramps; and surfaces intended to receive waterproofing, roofing, insulation, or sand-bed terrazzo: Floated finish.

c. Interior slabs and flatwork to be exposed in the completed structure and for slabs to receive resilient floor coverings: Troweled finish.

d. Horizontal walking surfaces must have tested dynamic coefficient of friction between 0.6 to 0.8 per ANSI 326.3.

K. Work in hot weather must conform to all requirements of ACI 305R.

L. Work in cold weather must conform to all requirements of ACI 306.1.

3.02 FORMWORK

A. Formwork requirements are according to Section 03 11 00 - Formwork and as supplemented in this Section.

B. Construct forms for easy removal without hammering or prying against concrete surfaces. Provide crush or wrecking plates where there is risk of damage to cast-in-place surfaces due to stripping. Provide top forms for inclined surfaces steeper than 1.5 horizontal to 1 vertical.

C. Close temporary openings with panels tightly fitted to forms and securely braced to prevent loss of concrete mortar. Locate temporary openings in forms at inconspicuous locations.

D. Do not chamfer edges of concrete at stair landings, treads, horizontal walking surfaces or where concrete is to be covered by another material such as tile.

3.03 JOINTS FOR CAST-IN-PLACE CONCRETE

A. Formwork requirements are according to Section 03 30 00 Cast-In-Place Concrete and as supplemented in this Section.

B. Construction Joints: Install construction joints true to line with faces perpendicular to surface plane of cast-in-place concrete so strength and appearance of concrete are not impaired, at locations indicated or as approved by Enginee-of-Record and Architect-of-Record.

C. Control/Sawcut Joints: Form weakened-plane control joints true to line with faces perpendicular to surface plane of cast-in-place concrete so strength and appearance of concrete are not impaired, at locations indicated or as approved by Engineer-of-Record and Architect-of-Record.

1. Saw cut 1/4 inch wide by 3/4 inch deep joints in locations as shown on Issued for Construction drawings. Where joint cannot be cut with walk-behind saw at obstructions, hand cut joint to obstruction. Exercise caution to not damage obstruction materials.

2. Determine optimum time to sawcut based on field sample installation and weather conditions impacting curing at time of concrete placement.

3. Provide Control Joints for every 100-150 Square Feet, with joints spaced at a maximum of 16 feet OC unless noted otherwise on Issued for Construction Drawings.

4. Add sawcuts at reentrant corners in order to avoid diagonal cracking between regularly spaced control joints, unless noted otherwise on Issued for Construction Drawings.

3.04 FIELD QUALITY CONTROL

A. Finishes: Conform to applicable requirements of ACI 347.3R-13.

B. Tolerances: Conform to the applicable requirements of ACI 301. For parts of the structures not covered by ACI 301, conform to the applicable requirements of ACI 117.

C. Report deficiencies to ST resident engineer no later than 24 hours after they are noticed.

3.05 ADJUSTING

A. Remedy for out-of-tolerance work:

1. Sound Transit will accept the designated Floor Sections measuring at or above both of the specified Minimum Local value (MLV) F-Numbers for tolerance compliance as constructed.

2. Grout and/ or re-top the Floor Sections measuring below the specified Minimum Local Value (MLV) F-Numbers as directed by the Resident Engineer.

a. For the purposes of this paragraph, a Floor Section is any rectangular area of approximately 1500 square feet.

3.06 CLEANING

A. Clean cast-in-place concrete surfaces after finish treatment to remove stains, markings, dust, and debris.

B. Wash and rinse surfaces according to concrete finish applicator's written instructions. Protect other Work from staining or damage due to cleaning operations.

C. Do not use cleaning materials or processes that could change the appearance of cast-in-place concrete finishes.

3.07 PROTECTION

A. Protect exposed concrete surfaces as required preventing damage from impact or strains using guards and barriers.

B. Protect concrete from staining, laitance, and contamination during remainder of construction period.

END OF SECTION

SECTION 03 41 00

PRECAST STRUCTURES GENERAL

PART 1 - GENERAL

1.01 SUMMARY

A. This Section includes:

1. Requirements for the fabrication and erection of precast concrete components (prestressed I girders, slab girders and tub girders, precast prestressed deck panels, and other miscellaneous precast structures) and structures associated with elevated guideways and stations, and associated with roadway bridges, as indicated in the Issued for Construction Documents.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents.

1. Washington State Department of Transportation (WSDOT):

a. WSDOT Standard Specifications for Road, Bridge, and Municipal Construction.

b. WSDOT Bridge Design Manual LRFD, M 23-50.

2. American Concrete Institute (ACI):

a. ACI SPEC-301 Specifications for Structural Concrete.

b. ACI CODE-318 Building Code Requirements for Structural Concrete and Commentary.

3. American Welding Society (AWS):

a. AWS D1.1/ D1.1M Structural Welding Code – Steel.

b. AWS D1.4/ D1.4M Structural Welding Code – Steel Reinforcing Bars.

4. Concrete Reinforcing Steel Institute (CRSI):

a. CRSI Manual of Standard Practice.

5. Precast/Prestressed Concrete Institute (PCI):

a. PCI MNL-116 Manual for Quality Control for Plants and Production of Structural Precast Concrete Products.

b. PCI MNL-117 Manual for Quality Control for Plants and Production of Architectural Precast Concrete Products.

c. PCI MNL-120 PCI Design Handbook.

d. PCI MNL-123 Design and Typical Details of Connections for Precast and Prestressed Concrete.

e. PCI MNL-135 Tolerance Manual for Precast and Prestressed Concrete Construction.

1.03 SUBMITTALS

A. Submit

1. Shop Drawings: In accordance with WSDOT Standard Specifications Section 6-02.3(9)A or Section 6-02.3(25)A.

a. Provide details of all connections, joints, accessories, cast inserts, and openings.

2. Concrete for Precast Units and Panels:

a. In accordance with WSDOT Standard Specifications Section 6-02.3(9).

3. Quality Control Plan: in accordance with requirements of Plant Quality System Manual in PCI MNL-116. The precast concrete production not to proceed prior to Sound Transit approval of the Quality Control Plan,

4. Fabricator Qualifications

5. Design Engineer Qualifications

6. Welder Qualifications

B. Transmit:

1. Product Data: Manufacturer's information on accessory products, including pigments, admixtures, inserts and plates.

1.04 QUALITY ASSURANCE

A. Perform the work of this Section in accordance with PCI MNL-116, PCI MNL-117, PCI MNL-120, PCI MNL-123, PCI MNL-135, ACI 301, ACI 318, and CRSI Manual of Standard Practice. Perform welding in accordance with AWS D1.1/D1.1M.

1. Maintain one copy of each document on site.

B. Fabricator Qualifications:

1. Firm having at least ten (10) years of documented experience in production of precast concrete of the type required.

2. Employ a full time on-site Quality Control Manager certified by PCI for Plant Quality Personnel, Level II.

3. Certified Concrete Fabricator that meets the requirements of WSDOT Standard Practice QC7 – Annual Precast Plant Review and Approval Process prior to the start of production.

C. Design Engineer Qualifications:

1. Design precast concrete units under direct supervision of a Professional Structural Engineer with at least five years of experience in design of precast concrete and licensed in State of Washington.

D. Welder Qualifications:

1. Welders must be certified within previous 12 months in accordance with AWS D1.1/1.1M and AWS D1.4/1.4M.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Handling and Storage: In accordance with WSDOT Standard Specifications Section 6-02.3(9)G and 6- 02.3(25)L.

B. Delivery: In accordance with WSDOT Standard Specifications Section 6-02.3(9)H and 6-02.3(25)L.

C. Deliver precast units to project site in such quantities and at such times to ensure continuity of installation.

D. Protect units to prevent staining, chipping, or spalling of concrete.

E. Mark units with date of production in location that will be concealed after installation.

PART 2 - PRODUCTS

2.01 MATERIALS

A. The materials used in the Work must be as indicated on the Issued for Construction Drawings and conform to the applicable provisions of WSDOT Standard Specifications Section 6-02, unless specified otherwise.

2.02 FABRICATION

A. Fabrication must be in accordance with applicable provisions of WSDOT Standard Specifications Section 6-02.3(9).

PART 3 - EXECUTION

3.01 GENERAL

A. Perform the Work described in this Section in accordance with the applicable provisions of WSDOT Standard Specifications Section 6-02, unless specified otherwise.

B. Prestressed Concrete Girder

1. For prestressed concrete girders, perform the Work in accordance with WSDOT Standard Specifications Section 6-02.3(25).

C. Concrete for Precast Units and Panels

D. For concrete for precast units, perform the Work in accordance with WSDOT Standard Specifications Section 6-02.3(9).

3.02 FIELD QUALITY CONTROL

A. Inspection:

1. For inspection of precast units, perform the Work in accordance with WSDOT Standard Specifications Sections 6-02.3(9), 6-02.3(25).

END OF SECTION

SECTION 03 45 00

PRECAST ARCHITECTURAL CONCRETE

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Requirements for:

a. Delegated engineering design of non-structural precast architectural concrete work.

b. Supports, anchors, attachments, and other items cast into non-structural precast concrete units.

c. Grouting under and between units.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. American Concrete Institute International (ACI).

a. ACI 301 Specifications for Structural Concrete for Buildings.

b. ACI 318 Building Code Requirements for Structural Concrete and Commentary.

2. ASTM International (ASTM):

a. ASTM A36/A36M Standard Specification for Carbon Structural Steel.

b. ASTM A153/A153M Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.

c. ASTM A325 Standard Specification for Structural Bolts, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength.

d. ASTM A563 Standard Specification for Carbon and Alloy Steel Nuts.

e. ASTM C33 Standard Specification for Concrete Aggregates.

f. ASTM C150 Standard Specification for Portland Cement.

g. ASTM C1107 Standard Specification for Hydraulic-Cement Grout (Non-shrink).

h. ASTM F436 Standard Specification for Hardened Steel Washers.

i. ASTM F959 Standard Specification for Compressible-Washer-Type Direct Tension Indicators for Use with Structural Fasteners.

3. American Welding Society (AWS):

a. AWS D1.1/D1.1M Structural Welding Code – Steel.

b. AWS D1.4/D1.4M Structural Welding Code - Reinforcing Steel.

4. Precast/Prestressed Concrete Institute (PCI):

a. PCI MNL-117 Manual for Quality Control for Plants and Production of Architectural Precast Concrete Products.

b. PCI MNL-120 PCI Design Handbook - Precast and Prestressed Concrete.

c. PCI MNL-122 Architectural Precast Concrete.

d. PCI MNL-123 Design and Typical Details of Connections for Precast and Prestressed Concrete.

e. PCI MNL-135 Tolerance Manual for Precast and Prestressed Concrete Construction.

1.03 SUBMITTALS/ TRANSMITTALS

A. Submittals:

1. Product Data: Manufacturer's information on accessory products, including pigments, admixtures, inserts and plates.

2. Shop Drawings: Indicate layout, dimensions, and cross sections, unit locations, configuration, unit identification marks, reinforcement, connection details, support items, location of lifting devices, dimensions, openings, and relationship to adjacent materials. Provide erection drawings.

a. Include details of mix designs.

b. Include structural design calculations, including loads imposed on structure, prepared by a qualified professional engineer.

c. Include sequencing of erection, procedures, tolerances, and other items necessary for fabrication.

d. Show welded connections using AWS standard symbols.

e. Provide details of all connections, joints, accessories, cast inserts, and openings.

3. Samples:

a. Submit two concrete cast samples, 12 inches by 24 inches in minimum size, illustrating surface finish and texture. Sample to be kept on site for reference and quality control standard.

B. Transmittals:

1. Fabricator qualifications.

2. Maintenance Data: Indicate surface cleaning instructions.

1.04 QUALITY ASSURANCE

A. Perform the work of this Section in accordance with PCI MNL-117, PCI MNL-120, PCI MNL-122, PCI MNL-123, PCI MNL-135, for Architectural quality concrete, ACI 318, and CRSI Manual of Standard Practice. Perform welding in accordance with AWS D1.1.

1. Maintain one copy of each document on site.

B. Fabricator Qualifications:

1. Firm having at least 2 years of documented experience in production of precast concrete of the type required.

2. Plant certified by Architectural Precast Association (APA), or as approved by Resident Engineer.

C. Design Engineer Qualifications: Design precast concrete units under direct supervision of a Professional Structural Engineer experienced in design of precast concrete and licensed in the state of Washington.

D. Welder: Certified within previous 12 months in accordance with AWS D1.1 and AWS D1.4.

1.05 MOCK-UP

A. Provide full size mock-up of each type of unit specified in this Section, with lifting device, and attachment points, and finish in accordance with approved sample.

B. Mock-up may remain as part of the Work, if approved by Sound Transit.

1.06 PRE-INSTALLATION MEETING

A. Convene one week prior to commencing work of this Section.

1.07 PROJECT CONDITIONS

A. Field Measurements:

1. Check actual locations of walls, slabs, framing, and other construction to which work of this Section must fit, by accurate field measurements before fabrication; show recorded measurements on final shop drawings. Coordinate fabrication, delivery and installation schedule with construction progress to avoid delay of work.

2. Where field measurements cannot be made without delaying the Work, guarantee dimensions and proceed with fabrication of products without field measurements. Coordinate construction with work of other trades to ensure that actual dimensions correspond to guaranteed dimensions. Allow for fitting and trimming.

1.08 DELIVERY, STORAGE, AND PROTECTION

A. Deliver precast units to project site in such quantities and at such times to ensure continuity of installation.

B. Handling: Lift and support precast units only from designated support points.

C. Blocking and Lateral Support During Transport and Storage: Use materials that are clean, non-staining, and non-harmful to exposed surfaces. Provide temporary lateral support to prevent bowing and warping, and cracking.

D. Protect units to prevent staining, chipping, or spalling of concrete.

E. Mark units with date of production in location that will be concealed after installation.

PART 2 - PRODUCTS

2.01 DESIGN REQUIREMENTS

A. Design units to withstand design loads and erection forces. Calculate structural properties of units in accordance with ACI 318.

B. Design units to withstand static loads and anticipated dynamic loading, including positive and negative wind loads and thermal movement loads.

C. Design and size components to withstand seismic loads and sway displacement as calculated in accordance with code.

D. Design units to accommodate construction tolerances, deflection of building structural members, and clearances of intended openings.

2.02 MANUFACTURERS

A. Architectural Precast Concrete: Any manufacturer holding an Architectural Precast Association (APA) Plant Certification for the types of products specified; see www.pci.org.

2.03 FORMWORK

A. Provide forms and, where required, form-facing materials of metal, plastic, wood, or other acceptable material that is nonreactive with concrete and will produce required finish surfaces.

B. Unless forms for plant-manufactured prestressed concrete units are stripped prior to detensioning, design forms so that stresses are not induced in precast units due to deformation of concrete under prestress or to movement during detensioning.

2.04 REINFORCEMENT

A. Comply with requirements of Concrete Reinforcing Section.

2.05 CONCRETE MATERIALS

A. Cement: ASTM C150, Type IL – General, Type II – Low-Alkali. or Type III – High Early Strength; Portland type.

B. Fine and Coarse Structural Aggregates: ASTM C33/C33M.

C. Surface Finish Aggregate: Clean, washed natural gravel; size as approved, color as approved, from single source throughout conforming to ASTM C33/C33M.

D. Water: Clean and not detrimental to concrete.

E. Admixtures: Air entrainment as specified in Section 03 30 00, Cast-in-Place Concrete.

F. Water reducing, retarding, or accelerating agents: ASTM C494/C949M, type as selected by fabricator, not containing more than 0.1 percent chloride ions.

G. Grout: Non-shrink, non-metallic, non-corrosive, non-staining, minimum 10,000 psi, 28-day strength, when tested in accordance with ASTM C1107, colored to match precast units.

2.06 FORM LINERS

A. Form-Facing Panels for As-Cast Finishes: Steel, glass-fiber-reinforced plastic, elastomeric urethane, or HDO faced plywood.

1. Units of face design, texture, arrangement, and configuration indicated in Issued for Construction Drawings.

2. Manufactured formliner sizes and patterns selected from manufacturer's standard line.

3. Custom formliners and progressive patterns are prohibited.

B. Source Limitations: Obtain each type of form-facing material from single source from single manufacturer.

C. Form-Release Agent: Commercially formulated, colorless form-release agent that will not bond with, stain, or adversely affect precast concrete surfaces and will not impair subsequent treatments of those surfaces:

1. Formulate form-release agent with rust inhibitor for steel form-facing materials.

2.07 SUPPORT DEVICES

A. Connecting and Support Devices: ASTM A36/A 36M steel; hot-dip galvanized in accordance with ASTM A153/A 153M or Stainless Steel AISI Type A316.

B. Bolts, Nuts, and Washers: ASTM A325 (A325M) heavy hex structural bolts, Type 1, plain, with matching ASTM A563 (A563M) nuts, and washers as follows:

1. Standard Washers: ASTM F436 washers, in finish matching bolts.

2. Compressible Direct Tension Indicators: ASTM F959, Type 325.

C. Primer: Steel elements not embedded in the precast unit, not galvanized, or non- stainless steel shall have a zinc-rich High Performance Coating.

2.08 ACCESSORIES

A. Bearing Pads: One of the following types, as recommended by precast fabricator for application:

1. Elastomeric Pads: AASHTO M251, plain, vulcanized, 100 percent polychloroprene (neoprene) elastomer, molded to size or cut from a molded sheet, Type A durometer hardness of 50 to 70, ASTM D2240, minimum tensile strength 2,250 psi, ASTM D412.

2. Random-Oriented, Fiber-Reinforced Elastomeric Pads: Preformed, randomly oriented synthetic fibers set in elastomer. Type A durometer hardness of 70 to 90, ASTM D2240; capable of supporting a compressive stress of 3,000 psi with no cracking, splitting, or delaminating in the internal portions of pad. Test one specimen for every 200 pads used in Project.

3. Cotton-Duck-Fabric-Reinforced Elastomeric Pads: Preformed, horizontally layered cotton-duck fabric bonded to an elastomer; Type A durometer hardness of 80 to 100, ASTM D2240; complying with AASHTO's "AASHTO Load and

4. Resistance Factor Design (LRFD) Bridge Design Specifications," Division II, Section 18.10.2, or with MIL-C-882E.

5. Frictionless Pads: Tetrafluoroethylene (Teflon), glass-fiber reinforced, bonded to stainless or mild-steel plate, of type required for in-service stress.

6. High-Density Plastic: Multimonomer, nonleaching, plastic strip.

B. Shims for Tread/Riser Units: High density plastic concrete grey color.

C. Sealant: Type specified in Joint Sealers Section.

2.09 CONCRETE MIXTURE

A. Prepare design mixtures for each type of precast concrete required.

B. Design mixtures may be prepared by a qualified Independent Testing Laboratory or by qualified precast plant personnel at architectural precast concrete fabricator’s option.

C. Limit water-soluble chloride ions to maximum percentage by weight of cement permitted by ACI 318 or PCI MNL 117 when tested according to ASTM C1218/C1218M.

D. Normal-Weight Concrete Mixtures: Proportion full-depth mixture by either laboratory trial batch or field test data methods according to ACI 211.1, with materials to be used on Project, to provide normal-weight concrete with the following properties:

1. Compressive Strength (28 days): 5,000 psi minimum.

2. Maximum Water-Cementitious Materials Ratio: 0.45.

E. Water Absorption: 6 percent by weight or 14 percent by volume, tested according to PCI MNL 117.

F. Add air-entraining admixture at manufacturer’s prescribed rate to result in concrete at point of placement having an air content complying with PCI MNL 117.

G. When included in design mixtures, add other admixtures to concrete mixtures according to manufacturer’s written instructions.

H. Provide anchors for embedding units in concrete, either integral or applied to units, as standard with manufacturer.

I. Apply clear lacquer to cut surfaces of extruded aluminum nosing units.

2.10 FABRICATION

A. Fabricate in conformance with PCI MNL-117 and PCI MNL-135.

B. Forms: Accurately construct forms mortar tight and of sufficient strength to withstand pressures due to concrete placing operations, temperature changes, and, when prestressed, pretensioning and detensioning operations. Maintain form work to provide completed precast concrete units of shapes, lines, and dimensions indicated, within specified fabrication tolerances.

C. Use rigid molds, constructed to maintain precast unit uniform in shape, size, and finish.

D. Use form liners in accordance with manufacturer’s instructions.

E. Fabricate connecting devices, plates, angles, items fit to steel framing members, inserts, bolts, and accessories. Fabricate to permit initial placement and final attachment.

F. Embed reinforcing steel, anchors, inserts plates, angles, and other cast-in items required for securing units to supporting and adjacent members.

G. Locate hoisting devices to permit removal after erection.

H. Cure units to develop concrete quality, and to minimize appearance blemishes such as non-uniformity, staining, or surface cracking.

I. Fabricate units straight, smooth, and true to size and shape, with exposed edges and corners precise and square unless otherwise indicated.

J. Cast-in Items: Provide reglets, slots, holes, and other accessories in units to receive windows, cramps, dowels, reglets, waterstops, flashings, and other similar work as indicated.

K. Minor patching in plant is acceptable, providing structural adequacy and appearance of units is not impaired.

2.11 FINISH – PRECAST UNITS

A. Panel faces shall be free of joint marks, grain, and other obvious defects. Corners, including false joints shall be uniform, straight, and sharp. Finish exposed-face surfaces of architectural precast concrete units to match approved sample panels and as follows:

1. As-Cast Surface Finish: Provide surfaces free of pockets, sand streaks, and honeycombs. Use light abrasive blast to remove surface sheen without exposing course aggregate.

2. Provide slip resistant sandblasted texture on tread surfaces conforming with ACI 301 “nonslip finish.”

B. Finish other exposed surfaces of architectural precast concrete units by smooth, steel-trowel finish.

C. Finish unexposed surfaces of architectural precast concrete units by float finish.

2.12 FABRICATION TOLERANCES

A. Conform to PCI MNL-117 and PCI MNL-135, except as specifically amended below.

1. 10 feet or less: Plus, or minus 1/8 inch.

2. 10 to 20 feet: Plus 1/8-inch, minus 3/16 inch.

3. Angular Deviation of Plane of Side Mold: 1/32 inch per 3 inches depth, or 1/16-inch total.

4. Openings: Plus, or minus 1/8 inch.

5. Out of Square: 1/8 inch per 6 feet.

6. Thickness: minus 1/8 inch, plus 1/4 inch.

7. Other Dimensions: 1/16 inch.

8. Maximum Variation from Nominal Face Dimensions: Plus, or minus 3/32 inch.

9. Maximum Variation from Square or Designated Skew: Plus, or minus 1/8 inch in 10 feet.

10. Maximum Variation from Thickness: Plus, or minus 1/8 inch.

11. Maximum Misalignment of Anchors, Inserts, Openings: Plus, or minus 1/8 inch.

12. Maximum Bowing of Members: Plus, or minus length/360.

2.13 SOURCE QUALITY CONTROL AND TESTS

A. Concrete Sampling and Testing:

1. Sampling Method: Take representative samples in compliance with ATSM C172. Collect samples from different batches of concrete on a random basis. Place no more than 1/2 cubic yard before slump, temperature, and air content tests demonstrate concrete is within acceptable limits.

2. Sampling Frequency: Obtain at least one composite sample for each 100 cubic yards, or fraction thereof, of each concrete mixture placed in any one day.

3. Tests Per Sample: Perform the following tests on each sample:

a. Slump: ASTM C143.

b. Air Content: ASTM C231.

c. Temperature: ASTM C1064.

d. Compressive Strength:

1) Make a minimum of three specimens from each sample. When additional sets of specimens are required beyond the normal seven and 28-day tests, include a minimum of two specimens in each set.

2) Make and cure specimens in compliance with ASTM C31. Record all deviations from the ASTM requirements in the test report.

3) Test specimens in compliance with ASTM C39. From each set of specimens cast, test one specimen at 7 days for information and two specimens at 28 days for acceptance, unless otherwise specified.

B. Evaluation and Acceptance of Tests:

1. Acceptance of Concrete:

a. Compressive strength tests will be considered acceptable if the averages of all specimens of three consecutive strength test results are equal to or exceed the specified 28-day compressive strength, and no individual strength test result is more than 300 pounds per square inch below the specified 28-day compressive strength.

b. If one specimen in a sample shows evidence of improper sampling, molding, or testing, discard the specimen, and consider the strength of the remaining cylinder to be the test result.

c. If both specimens in a sample show evidence of improper sampling, molding, or testing discard both specimens. Determine acceptance of concrete using test cores. The Resident Engineer may waive this requirement for large pours.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Verify that building structure, anchors, devices, and openings are ready to receive work of this Section.

3.02 PREPARATION

A. Provide for erection procedures and induced loads during erection. Maintain temporary bracing in place until final support is provided.

3.03 ERECTION

A. Deliver anchorage items to be embedded in other construction before start of such work. Provide setting diagrams.

B. Erect units without damage to shape or finish. Replace or repair damaged panels.

C. Erect units level, plumb, and in alignment within allowable tolerances specified below. Provide temporary supports and bracing as required to maintain position, stability, and alignment as members are being permanently connected.

D. Align and maintain uniform horizontal and vertical joints as erection progresses.

E. When units require adjustment beyond design or tolerance criteria, discontinue affected work; advise Resident Engineer.

F. Fasten units in place with mechanical connections, or weld, as indicated in shop drawings. At welded connections, chip off slag, and touch up with primer.

G. Set vertical units dry, without grout, attaining joint dimension with lead or plastic spacers. Pack grout to base of unit. Pack grout between units, tool with standard masonry.

H. Exposed Joint Dimension: Maximum ½-inch.

I. Seal perimeter and intermediate joints in accordance with Section 07 92 00, Joint Sealants.

3.04 ERECTION TOLERANCES

A. Erect members level and plumb within allowable tolerances. Conform to PCI MNL-135, except as specifically amended below.

1. Bowing: Not to exceed 1/360, with a maximum of 3/4 inch over 30 feet.
2. Warpage: Not to exceed 1/16 inch per foot, 1/8 inch maximum.
3. Joint Widths: Plus, or minus 3/16 inch total, 1/40 inch per foot taper.
4. Step in Face: 1/8 inch.
5. Edge Alignment: 1/8 inch.
6. Plumb: Plus, or minus 1/4 inch in 40 feet.
7. Level: Plus, or minus 1/4 inch in 40 feet.
8. Plan Location from Building Grid Datum: Plus, or minus 3/8 inch.
9. Top Elevation from Nominal Top Elevation: Plus, or minus 3/8 inch.
10. Maximum Plumb Variation over Height of Structure or 100 feet (whichever is less): Plus, or minus 1/2 inch.
11. Maximum Jog in Alignment of Matching Faces or Edges: Plus, or minus 3/16 inch.

3.05 ADJUSTING

A. Adjust units so that joint dimensions are within tolerances.

3.06 REPAIRS

A. Repair architectural precast concrete units if permitted by Resident Engineer. The Resident Engineer reserves the right to reject repaired units that do not comply with requirements.

B. Mix patching materials and repair units so cured patches blend with color, texture, and uniformity of adjacent exposed surfaces and show no apparent line of demarcation between original and repaired work, when viewed in typical daylight illumination from a distance of 20 feet.

C. Wire brush, clean, and paint damaged prime-painted components with same type of shop primer.

D. Remove and replace damaged architectural precast concrete units when repairs do not comply with requirements.

3.07 CLEANING

A. Clean surfaces of precast concrete units exposed to view.

B. Clean mortar, plaster, fireproofing, weld slag, and other deleterious material from concrete surfaces and adjacent materials immediately.

C. Clean exposed surfaces of precast concrete units after erection and completion of joint treatment to remove weld marks, other markings, dirt, and stains.

1. Perform cleaning procedures, if necessary, according to precast concrete fabricator’s recommendations. Clean soiled precast concrete surfaces with detergent and water, using stiff fiber brushes and sponges, and rinse with clean water. Protect other work from staining or damage due to cleaning operations.

2. Do not use cleaning materials or processes that could change the appearance of exposed concrete finishes or damage adjacent materials.

3.08 PROTECTION OF FINISHED WORK

A. Provide non-combustible shields during welding operations.

END OF SECTION

SECTION 03 62 00

NON-SHRINK GROUTING

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for providing non-shrink grouts as indicated below.

a. Furnishing, mixing, and placing non-shrink, nonmetallic, noncorrosive cementitious grout.

b. Furnishing, mixing, and placing non-shrink, nonmetallic, noncorrosive epoxy grout.

c. Not applicable to Non-Shrink Grout for Post-Tensioning Applications.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. American Concrete Institute (ACI):

a. ACI 503.2- 503.4 Three Epoxy Specifications.

2. American Society for Testing and Materials International (ASTM):

a. ASTM C109/C109M Standard Test Method for Compressive Strength of Hydraulic Cement Mortars (Using 2-in. cube Specimens).

b. ASTM C157/C157M Test Method for Length Change of Hardened Hydraulic-Cement Mortar and Concrete.

c. ASTM C579 Standard Test Methods for Compressive Strength of Chemical-Resistant Mortars, Grouts, Monolithic Surfacings, and Polymer Concretes.

d. ASTM C827/C827M Standard Test Method for Change in Height at Early Ages of Cylindrical Specimens of Cementitious Mixtures.

e. ASTM C881/C881M Standard Specification for Epoxy-Resin-Base Bonding Systems for Concrete.

f. ASTM C1090 Test Method for Measuring Changes in Height of Cylindrical Specimens of Hydraulic-Cement Grout.

g. ASTM C1107/C1107M Specification for Packaged Dry, Hydraulic-Cement Grout (Nonshrink).

h. ASTM D149 Standard Test Method for Dielectric Breakdown Voltage and Dielectric Strength of Solid Electrical Insulating Materials at Commercial Power Frequencies.

i. ASTM D638 Standard Test Method for Tensile Properties of Plastics.

j. ASTM D5992 Standard Guide for Dynamic Testing of Vulcanized Rubber and Rubber-Like Materials Using Vibratory Methods.

3. United States Army Corps of Engineers (COE):

a. COE CRD-C620 Standard Method of Sampling Fresh Grout.

4. Washington State Department of Transportation (WSDOT).

a. WSDOT Standard Specifications for Road, Bridge, and Municipal Construction.

1) Section 9-20.3(3) Grout Type 3 for Unconfined Applications.

2) Section 9-26.3 Epoxy Grout/Mortar/Concrete.

B. Definitions:

1. Non-shrink grout: A mortar or grout that does not shrink in the plastic state, is dimensionally stable in the hardened state, and bonds permanently to a clean baseplate and concrete substrate.

1.03 SUBMITTALS

A. Transmit

1. Product Data: Provide manufacturer's product data and installation instructions.

2. Certification: Provide certificates of compliance or laboratory test reports that indicate the following:

a. Materials used in the grout are free from metallic components and corrosion-producing elements.

b. Materials meet specified shrinkage and compressive strength requirements.

1.04 DELIVERY, STORAGE, AND HANDLING:

A. Follow manufacturer's instructions for storage, handling, placing and curing.

PART 2 - PRODUCTS

2.01 MATERIALS

A. Cementitious Grout: Provide non-shrink, nonmetallic, noncorrosive cement-based grout conforming to the following requirements:

1. Applicable standard: ASTM C1107/C1107M.

2. Expansion: 0.4 percent maximum at 3, 14, and 28 days. No displacement when tested in accordance with ASTM C157/C157M.

3. Shrinkage at 28 days: none (0.00 shrinkage when tested in accordance with ASTM C827/C827M).

4. Compressive strength, as indicated on the Issued for Construction Drawings, and not less than:

   a. At one day: 1000 pounds per square inch (psi).

   b. At three days: 2500 psi.

   c. At seven days: 3500 psi.

   d. At 28 days: 5000 psi.

5. Initial setting time, after addition of water: approximately one hour at 70 degrees Fahrenheit.

6. Provide nonsag trowelability or flowability as necessary for the particular application.

B. Water: Clean and potable, free of impurities detrimental to grout.

C. Epoxy Grout: Provide nonshrink, nonmetallic, noncorrosive epoxy grout conforming to the following requirements:

1. Grout must be manufactured specifically for use in supporting heavy loads.

2. Expansion: No displacement when tested in accordance with ASTM C827/C827M and ASTM C157/C157M, modified procedures.

3. Shrinkage at 28 days: None (0.00 shrinkage when tested in accordance with ASTM C827/C827M modified procedure using a specific gravity of indicator ball of approximately 1.0) with a minimum effective bearing area (EBA) of 95 percent.

4. Compressive strength, minimum: 10,000 psi at 7 days.

5. Initial setting time: Approximately one hour at 70 degrees Fahrenheit.

6. Provide flowable consistency as necessary for the particular application.

7. Epoxy grouts which are volatile and which give off noxious fumes are not acceptable.

8. Where aerial guideway bears on epoxy grout pads, provide manufacturer documentation that product will meeting the following performance standard.

   a. At maximum depth, grout pad creep will not exceed 1/8 in. over 100 years.

D. Epoxy Adhesive: ASTM C881/C881M, Type V, epoxy-based bonding agent.

E. Elastomeric Grout:

1. Tensile Strength: ASTM D638.

2. Dynamic Deflection: ASTM D5992.

3. Dielectric Strength: ASTM D149.

F. Unconfined non-shrink grout:

1. Meet the requirements of WSDOT Standard Specifications Section 9-20.3(3), Grout Type 3 for Unconfined Applications.

2.02 SOURCE QUALITY CONTROL

A. Inspections and Tests: Perform visual inspections, and shrinkage tests using an approved independent test laboratory, and strength tests as necessary to verify performance requirements of grout. Sample and test grout in conformance with applicable ASTM or COE CRD-620 requirements.

PART 3 - EXECUTION

3.01 PREPARATION

A. Prepare concrete surfaces to receive grout by chipping, sandblasting, water blasting, or other accepted methods specified by the manufacturer to remove defective concrete, laitance, dirt, oil, grease, and other foreign matter to achieve sound, clean, and roughened concrete surfaces, in accordance with the manufacturer's requirements.

B. Cover concrete areas with protective waterproof covering until ready to place grout.

C. Remove foreign matter from surfaces to be in contact with grout. Clean contact steel surfaces as necessary by wire brushing and wiping dust clean.

D. Align and level components to be grouted, and maintain in final position until grout placement is complete and accepted.

E. Install forms for grout about the columns and other spaces to be grouted.

F. Remove protective waterproof covering and clean contaminated surfaces immediately before grouting.

G. Provide air-relief holes in large baseplates and in baseplates where underneath obstructions cause air entrapment.

H. Saturate concrete surfaces with clean water, and remove excess water immediately before grouting.

I. Where necessary or appropriate for better bond, epoxy adhesive is permitted to clean, dry substrate surfaces in accordance with applicable requirements of ACI 503.2-503.4.

3.02 INSTALLATION

A. Mixing:

1. Mix grout ingredients in accordance with the respective manufacturer's instructions. Mix grout materials in proper mechanical mixers.

2. Mix grout as close to work area as possible.

B. Installation:

1. Place grout in accordance with the manufacturer's published instructions. Pour grout from one side only until grout rises at least one inch above the plate on opposite side of said plate. Strapping and plunging or other methods are permitted to be used to force grout to flow under the entire area.

C. Place Grout Type 3 for Unconfined Applications in accordance with requirements of WSDOT Standard Specifications Section 9-20.3(3).

D. Neatly trowel edges of grout base, tapered at an angle of 60 degrees when measured from the horizontal, or as indicated.

1. Do not remove leveling shims for at least 48 hours after grout has been placed.

2. After shims have been removed, if used, fill voids with grout, packing the material with a suitable tool.

3. Do not use grout that has begun to set or if more than one hour has elapsed after initial mixing.

3.03 CURING

A. Cure cementitious grout as specified by the grout manufacturer.

B. Cure epoxy grout as specified by the grout manufacturer.

END OF SECTION

SECTION 04 21 13

BRICK MASONRY

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for the following:

a. Clay Facing Brick.

b. Mortar and Grout.

c. Reinforcement and Anchorage.

d. Flashings.

e. Accessories.

1.02 REFERENCE STANDARDS

A. American National Standards Institute (ANSI):

1. ACI 530/530.1/ERTA - Building Code Requirements and Specification for Masonry Structures and Related Commentaries.

2. ASTM A240 - Standard Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications.

3. ASTM A580/A580M - Standard Specification for Stainless Steel Wire.

4. ASTM A666 - Standard Specification for Annealed or Cold-Worked Austenitic Stainless-Steel Sheet, Strip, Plate, and Flat Bar.

5. ASTM C67 - Standard Test Methods for Sampling and Testing Brick and Structural Clay Tile.

6. ASTM C144 - Standard Specification for Aggregate for Masonry Mortar.

7. ASTM C150/C150M - Standard Specification for Portland Cement.

8. ASTM C207 - Standard Specification for Hydrated Lime for Masonry Purposes.

9. ASTM C216 - Standard Specification for Facing Brick (Solid Masonry Units Made From Clay or Shale).

10. ASTM C212 – Standard Specification for Structural Clay Facing Tile.

11. ASTM C270 - Standard Specification for Mortar for Unit Masonry.

12. ASTM C1330 Standard Specification for Cylindrical Sealant Backing for Use with Cold Liquid-Applied Sealant.

13. ASTM C1384 - Standard Specification for Admixtures for Masonry Mortars.

B. Brick Industry Association (BIA):

1. BIA Technical Notes No. 7 - Water Penetration Resistance – Design and Detailing.

2. BIA Technical Notes No. 28B - Brick Veneer/Steel Stud Walls.

3. BIA Technical Notes No. 46 - Maintenance of Brick Masonry.

C. The Masonry Society (TMS):

1. TMS 402/602 Building Code Requirements and Specification for Masonry Structures, as adopted by the AHJ.

1.03 SUBMITTALS

A. Product Data: Provide data for masonry units, fabricated wire reinforcement, weeps, mortar stops, and mortar.

B. Samples: Submit samples of each color of decorative units in the form of straps of (5) or more bricks to illustrate color, texture, and extremes of color range. Submit samples of special shapes, pigmented mortar, weeps, and mortar breaks.

C. Shop Drawings: provide shop drawings indicating spacing and details of ties, control/expansion joints, end conditions, lintels, sills, jambs, and other special conditions. Include wall sections showing coordinated building envelope components including, ledges/ bearing angles, weather barrier, air barriers and flashing and air gap dimensions. Shop drawings shall be fully coordinated with all adjacent and supporting sections.

D. LEED Submittals:

1. Where LEED certification is required by the project, submit the same documentation for approval as required by GBCI as a project submittal. Highlight the relevant LEED information.

2. LEED documentation is to be submitted separately and titled LEED SUBMITTAL.

3. Building Product Disclosure and Optimization credit data: Submit data to support the LEED SUBMITTAL.

1.04 QUALITY ASSURANCE

A. Source Limitations for Masonry Units: Obtain exposed masonry units of a uniform texture and color, or a uniform blend within the ranges accepted for these characteristics, through one source from a single manufacturer for each product required.

B. Source limitations for Mortar Materials: Obtain mortar ingredients of a uniform quality, including color for exposed masonry, from a single manufacturer for each cementitious component and from one source or producer for each aggregate.

C. Comply with provisions of ACI 530/530.1/ERTA, except where exceeded by requirements of the contract documents.

D. Comply with provisions of TMS 402/602, except where exceeded by requirements of the contract documents.

E. Comply with recommendations of Brick Industry Association (BIA):

1. BIA Technical Notes No. 7 - Water Penetration Resistance – Design and Detailing.

2. BIA Technical Notes No. 28B - Brick Veneer/Steel Stud Walls.

3. BIA Technical Notes No. 46 - Maintenance of Brick Masonry.

F. Installer Qualifications:

1. Able to document not less than 5 years' experience regularly engaged in performing commercial quality masonry work of comparable magnitude as work of this Project.

2. Certified member in good standing of the Washington State Conference of Mason Contractors (WSCMC) or accepted by Architect prior to Bid Date. Other Installers who meet or exceed Quality Assurance and Qualifications criteria of WSCMC may submit Bid following acceptance by Architect.

3. Masonry Foreman:

a. Continuously in attendance and conducting supervision for duration of masonry work.

b. Able to document 5 years' experience supervising and laying out masonry construction.

G. Masonry Crew: Completed State approved journeyman apprenticeship training and able to demonstrate qualifications meeting or exceeding apprenticeship standards.

1.05 PRE-INSTALLATION CONFERENCE:

A. Arrange, in accordance with Section 01 30 00 - Administrative Requirements, Meetings & Submittals.

B. Attendance: Contractor, installer, Owner, Architect, manufacturer's representative, and those others requested to attend.

C. Meeting Time: Minimum 2 weeks prior to beginning work of this Section.

D. Location: Project Site.

1.06 MOCK-UP

A. Construct a typical exterior masonry wall corner as a mock-up panel sized minimum 4 feet long by 6 feet high with a minimum 12-inch return; include mortar and accessories, structural backup, wall openings, flashings, sealant-filled vertical control joint at least 16 inches long, mortar barrier, reinforcing, weeps, vapor barrier, and wall insulation in mock- up. Include cavity air/gap of exact depth to match designed wall.

B. Locate where directed by Resident Engineer.

C. Mock-up, if approved by Sound Transit, may remain as part of the Work if undisturbed at time of Substantial Completion.

1.07 DELIVERY, STORAGE, AND HANDLING

A. Deliver, handle, and store masonry units by means that will prevent mechanical damage and contamination by other materials.

1.08 FIELD CONDITIONS

A. Comply with requirements of TMS 402/602 or applicable building code, whichever is more stringent.

B. Maintain materials and surrounding air temperature to minimum 40 degrees F prior to, during, and 48 hours after completion of masonry work.

C. Maintain materials and surrounding air temperature to maximum 90 degrees F prior to, during, and 48 hours after completion of masonry work.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. Fire-Rated Assemblies: Conform to UL FRD and any applicable local authority having jurisdiction for fire-resistive requirements for fire-rated masonry construction.

2.02 BRICK UNITS

A. Facing Brick: Brick complying with ASTM C216, Type FBS, Grade SW:

1. Type: As indicated in Issued for Construction Drawings.

2. Color and texture: As indicated in Issued for Construction Drawings.

3. Actual size: As indicated in Issued for Construction Drawings.

4. Compressive Strength: As indicated on Issued for Construction Drawings, measured in accordance with ASTM C67.

2.03 MORTAR AND GROUT MATERIALS

A. Portland Cement: ASTM C150/C150M, Type I; color as required to produce approved color sample.

B. Hydrated Lime: ASTM C207, Type S.

C. Mortar Aggregate: ASTM C144.

D. Water: Clean and potable.

E. Color admixture: as defined in Issued for Construction Drawings.

F. Moisture-Resistant Admixture: Water repellent compound designed to reduce capillarity, minimize efflorescence and enhance mortar to brick unit bonding.

G. ASTM C 1384.

H. Mortar for Unit Masonry: ASTM C270, Proportion Specification:

1. Exterior, non-loadbearing masonry; Type N.

2.04 REINFORCEMENT AND ANCHORAGE

A. Joint Reinforcement: Continuous wire (3/16-inch diameter), ASTM A580 Type 316 stainless steel.

B. Masonry Veneer Anchors: 2-piece anchors that permit differential movement between masonry veneer and structural backup, Stainless Steel conforming to A666 for plate and strip stock, and A 580 for wire, Type 316. Structural backup is concrete, CMU or steel stud walls per plans:

1. Anchor plates: Not less than 0.075 inch thick, designed for fastening to structural backup through sheathing by two fasteners; provide design with legs that penetrate sheathing and insulation to provide positive anchorage.

2. Wire ties: Manufacturer's standard shape, 3/16-inch round.

3. Vertical adjustment: Not less than 3-1/2 inches.

4. Seismic Feature: Provide lip, hook, or clip on end of wire ties to engage or enclose continuous horizontal joint reinforcement wire 0.1483-inch diameter.

5. Where control joints occur, provide stabilizing control joint anchors to resist lateral movement. Material and gauge to match others.

2.05 FLASHINGS

A. Stainless Steel: ASTM A240/A240M, Type 304, 0.025-inch-thick mill finish.

B. Lap Sealant: Non-curing Butyl type as recommended by Manufacturer.

C. Install reglets to receive counterflashing where shown per Section 07 62 00 - Sheet Metal Flashing and Trim.

2.06 ACCESSORIES

A. Joint Filler / Backer Rod:

1. Backer Rod: Closed cell polyethylene or neoprene; oversized 50 percent to joint width; self-expanding; maximum lengths available complying with ASTM C1330.

2. Vertical Construction/ Control Joints and perimeter seals at windows and doors: per Section 07 92 00 - Joint Sealants.

3. Expansion Joint Filler or Covers for building seismic and expansion joints: As specified elsewhere in the contract documents.

4. Horizontal Compression Joints: To accommodate vertical deflection at horizontal joints, where indicated on Issued for Construction Drawings: Closed cell neoprene Sponge Rubber to meet ASTM D1056, Non- adhesive type

B. Cavity Vents and Cavity Vent Weeps: UV- stabilized, insect-resistant, free-draining mesh made from polyethylene strands, full height and width of head joint and depth 1/8 inch less than depth of outer wythe:

1. Basis of Design:

a. Mortar Net Solutions: Product: WeepVent.

b. Approved Equal.

2. Color as selected by Architect from manufacturer's standard colors.

C. Cavity Mortar Diverter: Semi-rigid polyethylene or polyester mesh panels, sized to thickness of wall cavity with trapezoidal shaped notches to suspend mortar at unequal heights, and designed to prevent mortar droppings from clogging weeps and vents and allow proper cavity drainage. Integral insect-proof design or provide additional insect screening required by manufacturer.

1. Basis of Design:

a. Mortar Net Solutions: MortarNet with Insect Barrier.

b. Hohmann & Barnard Inc, Mortar Trap.

c. Approved Equal.

D. Cleaning Solution: Non-acidic, not harmful to masonry work or adjacent materials.

2.07 WATER REPELLENTS

A. See Section 07 19 10 - Water Repellents and Graffiti Protection.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Verify that field conditions satisfy product requirements, meet section 1.08 of this specification, and are ready to receive masonry.

B. Verify that related items provided under other sections are properly sized and located.

C. Verify that built-in items are in proper location, and ready for roughing into masonry work.

3.02 COURSING

A. Establish lines, levels, and coursing indicated. Protect from displacement.

B. Maintain masonry courses to uniform dimension. Form vertical and horizontal joints of uniform thickness.

3.03 PLACING AND BONDING

A. Lay solid masonry units in full bed of mortar, with full head joints, uniformly jointed with other work. Lay exposed masonry in bond pattern indicated on Issued for Construction Drawings.

B. Buttering corners of joints or excessive furrowing of mortar joints is not permitted.

C. Remove excess mortar as work progresses.

D. Interlock intersections and external corners, except for units laid in stack bond.

E. Do not shift or tap masonry units after mortar has achieved initial set. Where adjustment must be made, remove mortar and replace.

F. Perform job site cutting of masonry units with proper tools to provide straight, clean, unchipped edges. Do not install masonry units with broken corners or edges.

G. Isolate top joint of masonry veneer from horizontal structural framing members or support angles with compressible joint filler.

3.04 CAVITY CONSTRUCTION

A. Provide not less than 2 inches of air space between back of masonry veneer and face of masonry or concrete wall.

B. Do not permit mortar to drop or accumulate into cavity air space or to plug weep/cavity vents.

C. Install cavity mortar diverter at base of cavity and at other flashing locations in accordance with manufacturer's instructions to prevent mortar droppings from blocking weep/cavity vents.

D. Install cavity vents/weeps in veneer walls at 24 inches on center horizontally above through-wall flashing unless otherwise indicated.

E. Install cavity vents in veneer walls at 24 inches on center horizontally below shelf angles and lintels and at top of walls.

3.05 REINFORCEMENT AND ANCHORAGE - MASONRY VENEER

A. Install horizontal joint reinforcement not more than 15 inches on center vertically and not more than 15 inches on center horizontally.

B. Place masonry joint reinforcement in first and second horizontal joints above and below openings. Extend minimum 16 inches each side of opening.

C. Lap joint reinforcement ends minimum 6 inches.

D. Embed connector sections and continuous wire in masonry joints.

E. Secure veneer anchors to back-up and embed into masonry veneer at maximum 15 inches on center vertically and 16 inches on center horizontally, or as shown on structural drawings. Place additional anchors at perimeter of openings and ends of panels, so maximum spacing of anchors is 8 on center.

F. Seismic Reinforcement: Connect veneer anchors with continuous horizontal wire reinforcement before embedding anchors in mortar.

G. Comply with provisions of TMS 402/602, except where exceeded by requirements of Contract Documents.

3.06 MASONRY FLASHINGS

A. Whether or not specifically indicated, install two-piece masonry flashing to divert water to exterior at all locations where downward flow of water will be interrupted:

1. Extend flashings full width at such interruptions and at least 6 inches, minimum, into adjacent masonry or turn up at least 8 inches, minimum, to form watertight pan at non-masonry construction.

B. Extend metal flashings through exterior face of masonry and turn down to form drip.

C. Lap end joints of flashings at least 6 inches, minimum, and seal watertight with flashing sealant/adhesive.

3.07 CONTROL AND EXPANSION JOINTS

A. Do not continue horizontal joint reinforcement through control or expansion joints.

B. Install preformed control joint device in as long of lengths as possible. Seal butt and corner joints in accordance with manufacturer's instructions.

3.08 TOLERANCES

A. Maximum Variation From Unit to Adjacent Unit: 1/16 inch.

B. Maximum Variation from Plane of Wall: 1/4 inch in 10 ft and 1/2 inch in 20 ft or more.

C. Maximum Variation from Level Coursing: 1/8 inch in 3 ft and 1/4 inch in 10 ft; 1/2 inch in 30 ft.

3.09 CUTTING AND FITTING

A. Cut and fit for pipes and conduit. Coordinate with other sections of work to provide correct size, shape, and location.

B. Obtain approval from Resident Engineer prior to cutting or fitting masonry work not indicated or where appearance or strength of masonry work may be impaired.

3.10 CLEANING

A. Remove excess mortar and mortar smears as work progresses.

B. Replace defective mortar. Match adjacent work.

C. Clean soiled surfaces with cleaning solution.

3.11 SEALING

A. Seal cleaned and completed masonry within in the touch zone with anti-graffiti coating per Section 07 19 10 - Water and Graffiti Repellents. Continue sealer to next full course of masonry if touch zone demarcation occurs in the middle of a brick.

1. Where masonry walls are 12 feet high or less and where indicated on Issued for Construction Drawings, apply sealer and anti-graffiti coating full-height.

2. Confirm compatibility of sealer and brick with masonry supplier in writing prior to application.

3. Prior to proceeding with final work, apply mock-up and anti-graffiti test as described in Section 07 19 10 - Water and Graffiti Repellents .

4. Apply sealer within 24-72 hours after the brick surface has been cleaned, unless otherwise directed by masonry manufacturer.

3.12 PROTECTION OF FINISHED WORK

A. Without damaging completed work, provide protective boards at exposed external corners that are subject to damage by construction activities.

END OF SECTION

SECTION 04 22 00

CONCRETE UNIT MASONRY

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Section includes requirements for standard concrete unit masonry, mortar and grout, steel reinforcement and anchorage, accessories, and masonry installation.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents as adopted by the authorities having jurisdiction (AHJ):

1. The Masonry Society (TMS):

a. TMS 402/602 Building Code Requirements and Specification for Masonry Structures.

2. ASTM International (ASTM):

a. ASTM C90 Standard Specification for Loadbearing Concrete Masonry Units.

b. ASTM C140 Standard Test Methods for Sampling and Testing Concrete Masonry Units and Related Units.

c. ASTM C144 Standard Specification for Aggregate for Masonry Mortar.

d. ASTM C150 Standard Specification for Portland Cement.

e. ASTM C207 Standard Specification for Hydrated Lime for Masonry Purposes.

f. ASTM C270 Standard Specification for Mortar for Unit Masonry.

g. ASTM C404 Standard Specification for Aggregates for Masonry Grout.

h. ASTM C476 Standard Specification for Grout for Masonry.

3. Underwriters Laboratories Inc. (UL):

a. UL Fire Resistance Directory (FRD).

1.03 SUBMITTALS

A. Submit:

1. Shop Drawings: Include individual CMU wall elevations including the following work:

a. Indicate reinforcement fabrication, bending, and placement. Include bar schedules, stirrup spacing schedules, bending and arrangement diagrams for reinforcement.

b. Indicate height of walls, including top and bottom of all raked walls. Include location, length and design of bond beams.

c. Indicate location and provisions required for attachment of work included in other sections and the Issued for Construction Drawings. Work indicated must include all penetrations and openings for mechanical, electrical and systems equipment, ducts and conduit or piping including air spaces for moisture venting.

d. Indicate locations of openings and controls joints.

2. Concrete Masonry Unit Test Results: Test each variety of concrete unit masonry in accordance with ASTM C140 for conformance to requirements in Section 01 45 00 - Quality Assurance / Quality Control.

B. Transmit:

1. Product Data: Masonry units, fabricated wire reinforcement, mortar, and masonry accessories.

2. Manufacturers' Certificate: Certify that masonry units, grout and mortar mixes meet or exceed specified requirements. Include test results or International Code Council (ICC) Evaluation Reports for all specified items required to meet specific standards.

3. Samples: Four (4) samples of each type of masonry used to illustrate color, texture, and extremes of color range.

1.04 QUALITY ASSURANCE

A. Comply with provisions of the Quality Assurance Program in TMS 402 except where exceeded by requirements of the Issue for Construction Documents. Maintain copy of document on project site.

B. Fire-Rated Assemblies: Conform to UL FRD and any applicable local authority having jurisdiction for fire-resistive requirements for fire-rated masonry construction.

C. Mock-Up:

1. For each construction site, construct one masonry wall panel for each CMU type as mock-up panel of reinforced masonry sized 4 feet long by 4 feet high, or as needed to fully demonstrate, mortar and accessories, structural backup, reinforcing, wall openings, corners, flashings, attachment to structure, air spaces, and typical strike joints and patterns, including a typical control joint with proposed colored sealant.

2. Construct mock-up panel and obtain acceptance by Resident Engineer prior to construction of any masonry walls.

3. Locate where directed by Resident Engineer. CMU mockup panel must be standalone and not be part of permanent structure.

4. Accepted mock-ups to remain in place until all masonry work is complete. Remove mock-up at direction of the Resident Engineer.

D. Tolerances:

1. Erect masonry within the tolerances specified in TMS 602 Specification for Masonry Structures. Erect masonry within the tolerances specified in TMS 602 Specification for Masonry Structures.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Deliver, handle, and store masonry units by means that prevents mechanical damage and contamination by other materials and in compliance with manufacturer's written instructions.

1.06 PROJECT CONDITIONS

A. Comply with adverse weather construction requirements contained in TMS 402/ 602 except where exceeded by requirements of the Issued for Construction Documents.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. Concrete Masonry Walls as an exterior finish material as part of the building envelope:

1. No fewer than one layer of water-resistant barrier material attached to the studs or sheathing with flashing in such a manner as to provide a continuous water-resistive barrier behind the exterior wall veneer, complying with any of the following:

a. No. 15 felt complying with ASTM D266, Type 1.

b. ASTM E2556, Type I or II.

c. ASTM E331.

B. Other approved materials installed in accordance with the manufacturer’s installation instructions.

C. Apply a space or drainage material not less than 3/16 inch in depth to the exterior of the water-resistive barrier and a means for draining water that enters the assembly to the exterior:

1. Drainage on the exterior side of the water-resistive barrier to have a minimum drainage efficiency of 90 percent as measured in accordance with ASTM E2273 or Annex A2 or ASTM E2925.

2.02 MATERIALS

A. Concrete Masonry Units (CMU):

1. Comply with referenced standards and as follows:

a. Sizes: Provide standard hollow core units with nominal face dimensions of 16 inches by 8 inches and nominal depth, unless noted otherwise on Issued for Construction Drawings.

b. Special Shapes: Provide non-standard blocks configured for corners, bond beams, lintels, headers, sloped caps, control joint edges (sash blocks), and other detailed conditions.

c. Load-Bearing Units (Typical): ASTM C90, Type 1, normal or medium weight with a minimum compressive strength as noted on Issued for Construction Drawings.

d. Acceptable CMU types are as follows:

1) CMU-1: Standard concrete masonry unit, smooth, natural gray.

2) CMU 2: Standard concrete masonry unit, smooth, color as shown on Issued for Construction Drawings.

3) CMU 3: Ground face finish, color as shown on Issued for Construction Drawings.

4) CMU 4: Split face finish, color as shown on Issued for Construction Drawings.

B. Mortar and Grout Materials:

1. Portland Cement: ASTM C150, Type I, II or III.

2. Hydrated Lime: ASTM C207, Type S.

3. Grout Aggregate: ASTM C404.

4. Mortar Aggregate: ASTM C144; washed aggregate consisting of natural sand or crushed stone.

5. Water: Clean and not detrimental to mortar mixture.

6. Provide Water Repellent Admixture: Liquid water repellent mortar admixture intended for use with CMU containing integral water repellent from same manufacturer.

7. Integral Water Repellent for units subject to exterior elements. Liquid polymeric, integral water repellent admixture that does not reduce flexural bond strength. Units made with integral water repellent, when tested according to ASTM E514/E514M as a wall assembly made with mortar containing integral water repellent manufacturer's mortar additive, with test period extended to 24 hours, and show no visible water or leaks on the back of test specimen.

C. Reinforcement and Anchorage:

1. Reinforcing Steel: Type and grade as specified in concrete reinforcing in the Issued for Construction Documents.

2. Flexible Anchors: 2-piece anchors that permit differential movement between masonry and building frame, sized to provide not more than 1 inch and not less than 1/2 inch of mortar coverage from masonry face (no exceptions).

D. Embedded Flashings:

1. Through-Wall Metal Flashing: Provide metal flashing complying with sheet metal flashing and trim as stated in the Issued for Construction Documents.

E. Flexible Flashing: For flashing not exposed to the exterior:

1. Rubberized-Asphalt Flashing: Composite flashing product consisting of a pliable, adhesive rubberized-asphalt compound, bonded to a high-density, cross- laminated polyethylene film to produce an overall thickness of not less than 0.030 inch.

a. Products:

1) Carlisle Coatings & Waterproofing; CCW-705-TWF Thru-Wall Flashing.

2) Dayton Superior Corporation, Dur-O-Wal Division; Dur-O-Barrier- 44.

3) Grace Construction Products, a unit of W. R. Grace & Co. - Conn.; Perm-A-Barrier Wall Flashing.

4) Heckmann Building Products Inc.; No. 82 Rubberized-Asphalt Thru-Wall Flashing.

5) Hohmann & Barnard, Inc.; Textroflash.

6) Polyguard Products, Inc.; Polyguard 300.

7) Polytite Manufacturing Corp.; Poly-Barrier Self-Adhering Wall Flashing.

2.03 ACCESSORIES

A. Preformed Control Joints: Rubber material. Provide with corner and tee accessories, fused joints:

1. Manufacturers:

a. Dur-O-Wal.

b. Hohmann & Barnard, Inc.; Product as detailed.

c. Masonry Reinforcing Corporation of America

B. Joint Filler: Closed cell polyvinyl chloride; oversized 50 percent to joint width; self- expanding; 6 inches wide by the maximum lengths available.

1. Manufacturers:

a. Dur-O-Wal; Product as detailed.

b. Hohmann & Barnard, Inc.; Product as detailed.

c. Masonry Reinforcing Corporation of America.

C. Weep/Vent Products: Use one of the following, unless otherwise indicated:

1. Cellular plastic weep/vent: one-piece, flexible extrusion made from UV-resistant polypropylene copolymer, full-height and width of head joint and depth 1/8 inch less than depth of outer wythe, in color selected from manufacturer’s standard.

2. Products:

a. Advanced Building Products Inc.; Mortar Maze weep vent.

b. Or approved equal.

D. Cavity Drainage Material: Use one of the following, unless otherwise indicated:

1. Free-draining mesh; made from polyethylene strands, full height and width of head joint and depth 1/8 inch less than depth of outer wythe; in color selected from manufacturer's standard.

2. Provide one of the following configurations:

a. Strips, not less than 1-½ inches thick and 10 inches high, with dimpled surface designed to catch mortar droppings and prevent weep holes from clogging with mortar.

b. Sheets or strips full depth of cavity and installed to full height of the cavity.

c. Provide at all through-wall flashings.

3. Products: Subject to compliance with requirements:

a. Mortar Net USA, Ltd.; Mortar Net Weep Vents.

b. or approved equal.

E. Mortar Barrier: Free-draining mesh, made from polymer strands that will not degrade within the wall cavity:

1. Provide strips full depth of cavity and 10 inches wide, with dovetail shaped notches 7 inches deep that prevent mesh from being clogged with mortar droppings.

2. Products:

a. Advanced Building Products Inc.; Mortar Break II.

b. Archovations, Inc.; CavClear Masonry Mat.

c. Dayton Superior Corporation, Dur-O-Wal Division; Polytite Mortar Stop.

d. Mortar Net USA, Ltd.; Mortar Net.

F. Cleaning Solution: Non-acidic, not harmful to masonry work or adjacent materials.

G. Masonry Ties and Anchors: ASTM E754 Standard Test Method for Pullout Resistance of Ties and Anchors Embedded in Masonry Mortar Joints.

2.04 MIXES

A. Mortar and Grout Mixes:

1. Mortar for Unit Masonry: ASTM C270 Standard Specification for Mortar for Unit Masonry. Use Type M or Type S for exterior, above grade, or load bearing condition. Refer to the Issued for Construction Documents for specific type and strength.

2. Grout: ASTM C476. Consistency required to fill completely volumes indicated for grouting; fine grout for spaces with smallest horizontal dimension of 2 inches or less; coarse grout for spaces with smallest horizontal dimension greater than 2 inches. Refer to the Issued for Construction Documents for additional requirements.

3. Mixing: Use mechanical batch mixer and comply with referenced standards.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Verify that field conditions are acceptable and are ready to receive masonry.

B. Verify that related items provided under other sections are properly sized and located.

C. Verify that built-in items are in proper location, and ready for roughing into masonry work.

D. Do not proceed until unsatisfactory conditions have been corrected.

3.02 PREPARATION

A. Direct and coordinate placement of metal anchors supplied for installation under other Sections.

B. Place reinforcement and ties in grout spaces prior to grouting.

C. Provide temporary bracing during installation of masonry work. Maintain in place until building structure provides permanent bracing.

3.03 INSTALLATION

A. Comply with referenced standards.

B. Leave openings for equipment to be installed. Coordinate with other trades.

C. Age units at least 21 days before installation to reduce the chance of shrinkage cracks at the mortar-unit interface.

D. Coursing

1. Establish lines, levels, and coursing indicated. Protect from displacement.

2. Maintain masonry courses to uniform dimension. Form vertical and horizontal joints of uniform thickness.

3. Concrete Masonry Units:

a. Bond: Running

b. Coursing: One unit and one mortar joint to equal 8 inches.

c. Mortar Joints: Concave. Joints that will be concealed by other construction (such as furred gypsum board) are permitted to be struck flush.

E. Placing and Bonding:

1. Lay out walls in advance for accurate spacing of surface bond patterns with uniform joint widths and for accurate location of openings, joints, returns, and offsets. Avoid the use of less than half-size units at corners, jambs, and other locations.

2. Lay hollow masonry units with face shell bedding on head and bed joints.

3. Buttering corners of joints or excessive furrowing of mortar joints is not permitted. Remove excess mortar and mortar smears as work progresses.

4. Interlock intersections and external corners.

5. Do not shift or tap masonry units after mortar has achieved initial set. Where adjustment must be made, remove mortar and replace.

6. Perform job site cutting of masonry units with proper tools to provide straight, clean, unchipped edges. Prevent broken masonry unit corners or edges.

7. During erection, cover tops of walls, projections, and sills with waterproof sheeting at the end of each day's work. Cover partially completed masonry when construction is not in progress. Extend cover a minimum of 24 inches down both sides and hold securely in place.

8. Stain Prevention: Prevent grout, mortar, and soil from staining the face of masonry to be left exposed or painted. Remove immediately all grout, mortar, and soil that comes into contact with such masonry.

a. Protect base of walls from rain-splashed mud and mortar splatter by means of coverings spread on wall surface and on the ground.

b. Protect sills ledges, and projections from mortar droppings.

9. Stopping and Resuming work: In each course, rack back as required, clean exposed surfaces of set masonry, wet clay masonry units if required, and remove loose units prior to laying fresh masonry.

10. Isolate masonry partitions from vertical structural framing members with a control joint.

11. Isolate top joint of masonry partitions from horizontal structural framing members and floor slabs or decks with compressible joint filler or firestopping as required.

F. Reinforcement and Anchorage:

1. Fasten anchors to structural framing and embed in masonry joints as masonry is laid. Place reinforcement, wall ties and anchors in accordance with the sizes, types and locations indicated on the Issued for Construction Drawings, and as specified. Do not place dissimilar metals in contact with each other.

G. Flashing, Weep Holes, Cavity Drainage, And Vents:

1. Install embedded flashing and weep holes in masonry at shelf angles, lintels, ledges, other obstructions to downward flow of water in wall, and where indicated.

2. Install flashing as follows, unless otherwise indicated:

a. Prepare masonry surfaces so they are smooth and free from projections that could puncture flashing. Where flashing is within mortar joint, place through-wall flashing on sloping bed of mortar and cover with mortar. Before covering with mortar, seal penetrations in flashing with adhesive, sealant, or tape as specified by flashing manufacturer.

b. At lintels and shelf angles, extend flashing a minimum of 6 inches into masonry at each end. At heads and sills, extend flashing 6 inches at ends and turn up not less than 2 inches to form end dams. Install metal flashing termination beneath flexible flashing at exterior face of wall. Stop flexible flashing 1/2 inch back from outside face of wall and adhere flexible flashing to top of metal flashing termination.

c. Cut flexible flashing off flush with face of wall after masonry wall construction is completed.

3. Install weep holes in head joints in exterior wythes of first course of masonry immediately above embedded flashing and as follows:

a. Use specified weep/vent products to form weep holes.

b. Space weep holes 24 inches on center, unless otherwise indicated.

4. Place mortar barrier material in cavities to comply with configuration requirements for Mortar Barrier Material Article in Part 2

H. Lintels:

1. Provide reinforced concrete or reinforced concrete masonry lintels as detailed or scheduled on Issued for Construction Drawings.

2. All lintels to maintain minimum 8-inch bearing on each side of opening.

I. Grouted Components:

1. Splices: Lap 24 bar diameters minimum.

2. Support and secure reinforcing bars from displacement. Maintain position within 1/2 inch of dimensioned position.

3. Place and consolidate grout fill without displacing reinforcing.

4. Do not place grout until entire height of masonry to be grouted has attained sufficient strength to resist grout pressure.

J. Control Joints:

1. Form control joint using sash blocks on both sides of joint.

2. Provide control joints as indicated on drawings.

3. Install preformed control joint device in continuous lengths. Seal butt and corner joints in accordance with manufacturer's instructions.

4. Size control joint to match typical mortar joint width.

K. Built-In Work:

1. As work progresses, install built-in metal door frames and other items to be built into the work and furnished under other sections.

2. Install built-in items plumb, level, and true to line.

3. Bed anchors of metal door and glazed frames in adjacent mortar joints.

a. Fill adjacent masonry cores with grout minimum 12 inches from framed openings.

4. Do not build into masonry construction organic materials that are subject to deterioration.

3.04 ADJUSTING

A. Cutting and Fitting:

1. Cut and fit for chases, pipes, conduit, and structure. Coordinate with other sections of work to provide correct size, shape and location.

2. Obtain approval prior to cutting or fitting masonry work not indicated or where appearance or strength of masonry work is impaired.

3.05 CLEANING

A. Remove excess mortar and mortar droppings.

B. Replace defective mortar. Match adjacent work.

C. Clean soiled surfaces with cleaning solution.

D. Use non-metallic tools in cleaning operations.

3.06 PROTECTION

A. Without damaging completed work, provide protective boards at exposed external corners of completed work, which are subject to damage by construction activities.

END OF SECTION

SECTION 05 05 13

SHOP-APPLIED COATINGS FOR METAL

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for galvanizing where indicated for steel items, excluding fasteners indicated in 05 05 23 – Metal Fastenings.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. American Galvanizers Association, Inc. (AGA).

a. Inspection of Hot-Dip Galvanized Steel Products.

2. American Society for Testing and Materials International (ASTM).

a. ASTM A123/A123M - Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.

b. ASTM A143/A143M - Standard Practice for Safeguarding Against Embrittlement of Hot-Dip Galvanized Structural Steel Products and Procedure for Detecting Embrittlement.

c. ASTM A153/A153M - Zinc Coating (Hot-Dip) on Iron and Steel Hardware.

d. ASTM A384/A384M - Standard Practice for Safeguarding Against Warpage and Distortion During Hot-Dip Galvanizing of Steel Assemblies.

e. ASTM A385 Practice for Providing High-Quality Zinc Coatings (Hot-Dip).

f. ASTM A767 / A767M Specification for Zinc-Coated (Galvanized) Steel Bars for Concrete Reinforcement.

g. ASTM A780/A780M - Standard Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings.

h. ASTM B6 - Standard Specification for Zinc.

i. ASTM B117 - Standard Practice for Operating Salt-Spray (Fog) Apparatus.

j. ASTM D6386 Practice for Preparation of Zinc (Hot-Dip Galvanized) Coated Iron and Steel Product and Hardware Surfaces for Painting.

k. ASTM E376 Practice for Measuring Coating Thickness by Magnetic-Field or Eddy-Current (Electromagnetic) Test Methods.

3. Society for Surface Protective Coatings (SSPC):

a. SP6 Commercial Blast Cleaning.

b. SP8 Pickling.

1.03 DEFINITIONS

A. Hot-dip galvanizing: Dipping steel members and assemblies into molten zinc, which results in zinc coating fusing permanently with base steel material for lasting, or long-term corrosion protection.

1.04 SUBMITTALS

A. Submit:

1. Coordination Drawings: To safeguard against distortion, furnish to the galvanizer steel fabricator's shop drawings of the following:

a. Non-standard fabrications.

b. Tubular fabrications.

c. Fabrications involving any dimension that exceed the size of the galvanizer's kettle.

d. Fabrications involving materials of different thicknesses.

2. Reports showing results of all inspections and tests.

3. Product Data: For each type of coating product specified.

B. Transmit:

1. Certification: Furnish certification for the following, signed by the galvanizer:

a. Membership in American Galvanizers Association Inc.

b. Materials used in galvanizing and repair.

c. Methods used in galvanizing and repair.

1.05 QUALITY ASSURANCE

A. Engage a galvanizing firm with a current membership in the American Galvanizers Association Inc. (AGA), specializing in hot-dip galvanizing after fabrication and following the procedures in the Quality Assurance Manual of the American Galvanizers Association.

B. Coordination Between Fabricator and Galvanizer: Prior to fabrication, fabricators shall submit approved fabrication shop drawings to the galvanizer. The Galvanizer shall review fabricator's shop drawings for suitability of materials for galvanizing and coatings and coordinate any required fabrication modifications.

C. Materials: For steel to be hot-dip galvanized, provide steel chemically suitable for metal coatings complying with the following requirements: carbon below 0.25 percent, phosphorous below 0.04 percent, manganese below 1.3 percent, and silicon below 0.04 percent. Notify the galvanizer if steel does not meet these requirements so that suitability for galvanizing may be determined and whether special processing techniques are required. Inspection and testing of hot-dip galvanized coatings shall be done under the guidelines provided in the AGA publication Inspection of Products Hot-dip Galvanized After Fabrication.

D. Inspect and test galvanized fabrications in accordance with ASTM A123/A123M for the following:

1. Visual examination of samples and finished products.

2. Thickness of coating.

3. Adhesion.

E. Mark all galvanized material with the galvanizer's stamp.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Deliver, store, and handle galvanized fabrications in a manner that prevents damage to the item and its galvanizing.

PART 2 - PRODUCTS

2.01 MATERIALS

A. Steel Materials:

1. Material for galvanizing to be geometrically suitable for galvanizing as described in ASTM A384 and A385. Steel materials suitable for galvanizing include structural shapes, pipe, sheet, fabrications, and assemblies.

2. Material to be chemically suitable for galvanizing.

3. Recommended steel materials for hot-dip galvanizing include but are not limited to:

a. Structural shapes and plates: ASTM A36, A242 type 2, A283, A441, A 500, A501, A529, A572, A588 and A992.

b. Steel for sheet metal articles: ASTM A569 or A570.

c. Steel for pipe or tubing: ASTM A53, A120 or A595, Gr A or B.

B. Zinc for Galvanizing: ASTM B6

C. Galvanizing Repair Paint: A three-part system using an organic zinc-rich primer, an epoxy or urethane intermediate coat, and a urethane topcoat. If the final finish will be a high-performance coating confirm compatibility with HPC-3 coating in accordance with Section 09 96 00 - High-Performance Coatings:

1. Non-Structural, Non-Load-Bearing Items Not Exposed To Weather:

a. Zinc-Rich Paints:

1) Zinc-Dust Content: Dried film shall contain 93 percent minimum of zinc-dust by weight.

2) Acceptable Manufacturers:

a) Galvax by Alvin Products Inc, Everett, MA.

b) ZRC Galvilite by ZRC Worldwide, Marshfield, MA.

2. Structural, Load-Bearing Items and Items Exposed To Weather:

a. Zinc-Based Solders, Powder, Or Rod:

1) Zinc-Cadmium solder with liquidus temperature range from 518 to 527 deg F, or

2) Zinc-Tin-Lead alloy with liquidus temperature range from 446 to 500 deg F.

b. Sprayed Zinc: Wire, ribbon, or powdered zinc suitable for process.

2.02 FABRICATION REQUIREMENTS

A. Fabricate structural steel in accordance with Class I, II, III guidelines as described in AGA's Recommended Details for Galvanized Structures.

B. Fabrication practices for products to be in accordance with the applicable portions of ASTM A143, A384, and A385, except as specified herein. Avoid fabrication techniques that could cause steel distortion or embrittlement.

C. The fabricator shall consult with architect/engineer and hot-dip galvanizer regarding potential concerns, including handling issues, during the galvanizing process that may require design modification before fabrication proceeds.

D. Remove all welding slag, splatter, anti-splatter compounds and burrs prior to delivery for galvanizing.

E. Provide holes and/or lifting lugs to allow for handling during galvanizing.

F. Avoid unsuitable marking paints. Consult with the galvanizer about removal of grease, oil, paint and other deleterious material prior to fabrication.

G. Remove by blast-cleaning, or other methods, surface contaminants and coatings that are not removable by the normal chemical cleaning process in the galvanizing operation.

H. Whenever possible, slip joints should be used to minimize field welding of material.

PART 3 - EXECUTION

3.01 PREPARATION

A. Complete fabrications to the greatest extent possible prior to galvanizing.

B. Mask areas that are to be field welded or that are to be shop welded to ungalvanized members to a distance of one inch from the weld line prior to galvanizing.

C. Clean all surfaces in accordance with SSPC SP6, Commercial Blast Cleaning (1 to 2 mil anchor pattern), as minimum.

D. Pickle all surfaces in accordance with SSPC SP8, Pickling.

3.02 APPLICATION

A. Conform to paragraph 6.1 of ASTM A123/123M, Table 1 of ASTM A153/153M, or Table 2 of A767, as appropriate.

B. Hot-dip galvanize in accordance with ASTM A123/A123M. Mix the galvanizing bath to contain 0.05 to 0.09 percent nickel by weight. Apply galvanizing in the weights and thicknesses specified.

C. Safeguard against steel embrittlement in accordance with ASTM A143/A143M.

D. Safeguard against warpage or distortion in accordance with ASTM A384/A384M. Notify the Resident Engineer of potential warpage problems that require modification in design before proceeding with fabrications.

E. Surface Finish: Continuous, adherent, as smooth and evenly distributed as possible and free from any defect detrimental to the stated end use of the coated article.

F. Adhesion: Withstand normal handling consistent with the nature and thickness of the coating and normal use of the article.

G. If the galvanized steel shall be painted:

1. Do not treat with quenching or chromate conversion.

2. Prepare surface as described in ASTM D6386 Practice for Preparation of Zinc (Hot-Dip Galvanized) Coated Iron and Steel Product and Hardware Surfaces for Painting.

3.03 REPAIR OF DAMAGED COATING

A. The maximum area to be repaired is defined in accordance with ASTM A123/123M, Section 6.2, current edition.

1. The maximum area to be repaired in the field shall be determined in advance by mutual agreement between parties.

B. Repair areas damaged by welding, flame cutting or during handling, transport or erection by one of the approved methods in accordance with ASTM A780 whenever damage exceeds 3/16 inch in width. Minimum thickness requirements for the repair are those described in ASTM A123/123M, Section 6.2, current edition.

C. Grind rough areas to produce a uniform surface.

3.04 FIELD QUALITY CONTROL

A. Inspection and testing of hot-dip galvanized coatings shall be done under the guidelines provided in the AGA publication Inspection of Products Hot-dip Galvanized After Fabrication.

B. Include visual examination and tests in accordance with ASTM A123/123M, A153/153M, A767, or E376 as applicable, to determine the thickness of the zinc coating on the metal surface.

END OF SECTION

SECTION 05 05 23

METAL FASTENINGS

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for welding and bolting of structural steel and metal fabrications, and welding of sheet steel.

2. Requirements for welders, welding procedures, and inspections and tests of welding and bolting.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. American Institute of Steel Construction (AISC):

a. AISC 303 Code of Standard Practice for Steel Buildings and Bridges.

2. American Society for Nondestructive Testing (ASNT).

3. Recommended Practice Number SNT-TC-1A Personnel Qualification and Certification in Nondestructive Testing.

4. ASTM International (ASTM):

a. ASTM A108 Standard Specification for Steel Bar, Carbon and Alloy, Cold-Finished.

b. ASTM A153/A153M Standard Specification for Zinc-Coating (Hot-Dip) on Iron and Steel Hardware.

c. ASTM A307 Standard Specification for Carbon Steel Bolts, Studs, and Threaded Rod 60,000 psi Tensile Strength.

d. ASTM F3125 / F3125M Standard Specification for High Strength Structural Bolts and Assemblies, Steel and Alloy Steel, Heat Treated, Inch Dimensions 120 ksi and 150 ksi Minimum Tensile Strength.

e. ASTM A563 Standard Specification for Carbon and Alloy Steel Nuts.

f. ASTM E94 / E94M Standard Guide for Radiographic Examination Using Industrial Radiographic Film.

g. ASTM E164 Standard Practice for Contact Ultrasonic Testing of Weldments.

h. ASTM E165 Standard Practice for Liquid Penetrant Testing for General Industry.

i. ASTM E709 Standard Guide for Magnetic Particle Testing.

j. ASTM E1032 Standard Practice for Radiographic Examination of Weldments Using Industrial X-Ray Film.

k. ASTM F436 / F436M Standard Specification for Hardened Steel Washers Inch and Metric Dimensions.

l. ASTM F844 Standard Specification for Washers, Steel, Plain (Flat), Unhardened for General Use.

m. ASTM F959 / F959M Standard Specification for Compressible-Washer- Type Direct Tension Indicators for Use with Structural Fasteners, Inch and Metric Series.

5. ASTM F3125 / F3125M Standard Specification for High Strength Structural Bolts and Assemblies, Steel and Alloy Steel, Heat Treated, Inch Dimensions 120 ksi and 150 ksi Minimum Tensile Strength, and Metric Dimensions 830 MPa and 1040 MPa Minimum Tensile Strength American Welding Society (AWS):

a. ANSI/AWS A2.4 Standard Symbols for Welding, Brazing, and Nondestructive Examination.

b. ANSI/AWS A3.0 Standard Welding Terms and Definitions.

c. ANSI/AWS B1.10 Guide for the Nondestructive Examination of Welds.

d. ANSI/AWS D1.1/D1.1M Structural Welding Code – Steel.

e. ANSI/AWS D1.3/D1.3M Structural Welding Code - Sheet Steel.

f. ANSI/AWS D1.5M/D1.5 Bridge Welding Code.

g. ANSI/AWS D1.6/D1.6M Structural Welding Code – Stainless Steel.

h. ANSI/AWS D1.8/D1.8M Structural Welding Code – Seismic Supplement.

i. AWS QC1 Specification for AWS Certification of Welding Inspectors.

6. Research Council on Structural Connections (RCSC):

a. Specification for Structural Joints Using ASTM A325 or A490 Bolts.

7. Washington Association of Building Officials (WABO):

a. WABO Welder and Welding Operator Performance Qualification Standard (No. 27-13).

8. Washington Department of Transportation (WSDOT):

a. WSDOT Standard Specifications for Road, Bridge and Municipal Construction.

B. Definitions:

1. Welds: Welding terms and definitions are per ANSI/AWS A3.0. Welding symbols are per ANSI/AWS A2.4.

2. Structural Steel: Elements of structural-steel frame, as classified by AISC 303, that support design loads.

3. Seismic Load Resisting System (SLRS): Assembly of Structural Steel elements that resist seismic loads. Members of SLRS are indicated in the Issued for Construction Drawings.

4. Seismic Demand-Critical Welds: Welds in the SLRS including:

   a. Complete penetration welds in beam-to-column connections, including welds to flanges, webs, and flange reinforcement, stiffener, and doubler plates.

   b. Complete penetration welds of column splices and of columns to base plates.

   c. Fillet welds connecting braced frame gusset plates to braces, beams, and columns.

   d. Other welds indicated as “Seismic Demand Critical” on the Issued for Construction Drawings.

5. Protected Zones: Area of a member in which limitations apply to fabrication and attachments. See Part 3 – EXECUTION of this Section.

6. Lowest Anticipated Service Temperature: 0 degrees Fahrenheit, as required by ANSI/AWS D1.8/D1.8M.

1.03 SUBMITTALS

A. Submit:

1. Shop Drawings: In compliance with AWS A2.4 and AWS A3.0.

   a. Welding Inspector Qualifications per Article 1.04 Quality Assurance.

   b. Personnel Performing Nondestructive Testing Qualifications per Article 1.04 Quality Assurance.

   c. Stud-Connector Manufacturer per Article 1.04 Quality Assurance.

B. Transmit:

1. Manufactured Products:

   a. Welding Electrode: Manufacturer’s certification of conformance.

   b. High-Strength Bolts, Nuts, and Washers: Manufacturer’s mill certificates demonstrating conformance.

   c. Mild Bolts, Nuts, and Washers: Manufacturer’s mill certificates demonstrating conformance.

   d. Direct Tension Indicating Washers: Manufacturer’s mill certificates demonstrating conformance, if proposed for use.

   e. Tension Control Structural Bolt-Nut-Washer Assemblies: Manufacturer’s mill certificates demonstrating conformance, if proposed for use.

2. Qualifications:

   a. AWS or WABO certified welders:

      1) Transmit certified copies of qualification test records for each welder, welding operator, and tack welder to be employed in the work.

Transmit welders' identification marks (ID) for each welder along with qualifications.

3. Welding Procedures:

   a. Prior to commencement of welding, submit the procedure to be used for qualifying welding procedures.

   b. For procedures other than those pre-qualified in accordance with AWS D1.1/D1.1M Structural Welding Code - Steel, submit a copy of procedure qualification test records in accordance with the qualification requirements of AWS D1.1/D1.1M, Section 4, Parts A and B.

4. Welding Records and Data: For field welding, transmit descriptive data for field welding test results and equipment used.

5. Mill Certificates: Retain mill certificates and certified copy of reports for all analyses and tests required by referenced AWS specifications.

6. Inspection and Test Reports: Forward inspection and test results to the Resident Engineer immediately after results are available. Results to state whether results are conforming or nonconforming.

   a. Visual inspection reports.

   b. Nondestructive test reports.

1.04 QUALITY ASSURANCE

A. Qualifications of Welders, Welding operators, and Tack welders: In accordance with AWS D1.1/D1.1M, Section 4, "Qualification", and ICC/WABO Certified.

B. Qualification of Welding Procedures: Prequalified or qualified in accordance with AWS D1.1/D1.1M, Section 4, "Qualification".

C. Qualifications of Welding Inspector: Contractor-employed AWS Certified Welding Inspector (CWI), certified in accordance with AWS QC1, and ICC/WABO Certified.

D. Qualification of Personnel Performing Nondestructive Testing (NDT):

   1. American Society for Nondestructive Testing Certified (ASNT SNT-TC-1A).

   2. Only persons certified for NDT Level I and working under an NDT Level II person or persons certified for NDT Level II are permitted perform nondestructive testing.

E. Weldability of Steel: For structural steel requiring impact test qualification, establish the weldability of the steel and the procedures for welding by qualification in accordance with AWS D1.1/D1.1M, Section 4, to match the notch toughness and weathering characteristics of the base metal.

F. Qualification of Stud-Connector Manufacturer: In accordance with ANSI/AWS D1.1/D1.1M, Annex IX, "Manufacturers' Stud Base Qualification Requirements. ICC/WABO structural steel building certified inspector for all high strength bolting.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Deliver, store, and handle welding electrodes in conformance with ANSI/AWS D1.1/D1.1M.

B. Deliver, store, and handle bolts, nuts, and washers in conformance with RCSC Specification.

1.06 BRIDGE AND PEDESTRIAN BRIDGE STEEL FASTENINGS

A. For steel bridges, steel pedestrian bridges, and fastenings of all steel components, refer to WSDOT Standard Specifications in lieu of the requirements in this section.

PART 2 - PRODUCTS

2.01 EQUIPMENT

A. Welding Rod/Electrodes for structural plate, shapes and bars:

1. Conform to AWS A5 Series Standards.

2. Use coated rods or wire of size and classification number as specified by their manufacturers for the positions and other conditions of actual use. Match filler metal in conformance with AWS D1.1/D1.1M, Table 3.1 or 3.2 consistent with design requirements.

2.02 MATERIALS

A. Fasteners:

1. High Strength Bolts:

a. Bolt: ASTM F3125 / F3125M.

b. Nuts: ASTM A563 heavy-hex.

c. Washers: ASTM F436.

d. Finish: Hot-dipped zinc coating per ASTM A153/A153M. Bolting conforming to ASTM F3125 Grade A490 must not be galvanized.

2. Tension Control Structural Bolt-Nut-Washer Assemblies:

a. Bolts: ASTM F3125 Grade F1852, Type 1, heavy hex or dome head, splined ends.

b. Nuts: ASTM A563 heavy hex.

c. Washers: ASTM F436.

d. Finish: Hot-dip zinc coat in conformance with ASTM A153/A153M, Class

e. Bolting conforming to ASTM F3125 Grade A490 must not be galvanized.

3. Mild Bolts: Provide mild bolts, where noted A307:

a. Bolts: ASTM A307, Type A.

b. Nuts: ASTM A563A hex.

c. Washers: ASTM F844.

d. Finish: Hot-dipped zinc coat in conformance with ASTM A153/A153M, Class C.

4. Anchor Bolts: Section 03 15 25 - Anchorage to Concrete.

5. Welded Shear Connectors and Welded Headed Studs: ASTM A108, grades 1010 through 1020, headed stud type, cold finished carbon steel, AWS D1.1/D1.1M, Type B.

B. Welding Electrodes for Structural Shapes, Plates, and Bars:

1. Conform to ANSI/AWS A5 Series Standards, with a minimum tensile strength of 70 ksi. Provide coated rods or wire of size and classification number as specified by the manufacturer for the positions and other conditions of actual use. Match filler metal requirements in conformance with ANSI/AWS D1.1/D1.1M.

2.03 FABRICATION

A. Unless specifically noted as field-welded, welds are permitted to be shop or field welded at the Contractor’s option. Perform shop welds in a WABO certified shop.

B. Welding of reinforcing steel for concrete: Conform to concrete reinforcing requirements as stated in the Issued for Construction Documents.

C. Shop Welding:

1. Perform shop welding as indicated in accordance with ANSI/AWS D1.1/D1.1M, AWS D1.5M/D1.5, ANSI/AWS D1.6/D1.6M, AWS D1.8/D1.8M, and ANSI/AWS D1.3/D1.3M, as applicable to the work.

2. Weld joints in conformance with approved AWS. Make ANSI/AWS D1.1/D1.1M available to welders and inspectors during fabrication.

3. Provide complete joint penetration welds for groove welds indicated on the Issued for Construction Drawings unless noted otherwise. Select groove preparation in conformance with ANSI/AWS D1.1/D1.1M.

4. Remove backing bars for complete joint penetration welds where indicated in the Issued for Construction Drawings or required for testing and inspection.

5. Mark welder ID adjacent to completed weld using metal stamp, metal engraving, keel, paint stick, or other appropriate marking material.

6. Weld stud shear connectors in conformance with stud manufacturer's printed instructions.

D. Anchorage to concrete: As stated in the Issued for Construction Documents.

E. Shop Bolting:

1. Drive bolts accurately into holes without damaging the thread. Protect bolt heads from damage during driving. Place washers and all bolt heads and nuts. Rest bolt heads and nuts squarely against the washers:

a. High-Strength Bolting Assemble joints in conformance with RCSC Specification.

b. Pretension bolts unless noted otherwise.

c. Pre-tensioned bolted connection qualification testing per RCSC must be performed.

d. Prepare faying surfaces for joints indicated as Slip-Critical in conformance with Class C for galvanized items, and in conformance with Class A for non-galvanized items.

e. Snug-tight connections are permitted in beam-to-beam connections only if specified on the plans or approved by an Engineer with the appropriate authority.

2.04 SHOP WELD QUALITY CONTROL

A. Shop Welding Procedures and Personnel: Verify the following prior to and during fabrication:

1. Welder qualifications and identifications.

2. Welding Procedures Specification (WPS) has been provided to and reviewed with each welder performing the Work.

3. Consumables meet WPS requirements.

4. Joint fit-up meets WPS requirements. Mark joint prior to welding.

5. Preheat and interpass temperatures and weld pass sequence meet WPS requirements.

B. Shop Welding Inspections and Testing:

1. Visual Inspection: ANSI/AWS D1.1/D1.1M. Visually inspect 100 percent of welds, for both permanent and temporary Work.

2. Ultrasonic Testing: ANSI/AWS D1.1/D1.1M, Chapter N of AISC 360-10 or the corresponding chapter in the latest edition, and ASTM E164, as applicable. Ultrasonically test complete joint penetration groove welds as follows:

a. 10 percent with material thickness equal to or less than 3/4 inch.

b. 50 percent with material thickness greater than 3/4 inch and equal to or less than 1-1/2 inches.

c. 100 percent for material thickness greater than 1-1/2 inches.

3. Magnetic Particle Inspection: ASTM E709, Chapter N of AISC 360-10 or the corresponding chapter in the latest edition. Inspect complete and partial joint penetration groove welds and fillet welds as follows:

a. 20 percent of complete joint penetration groove welds of tee and corner joints.

b. 10 percent of partial joint penetration groove welds and fillet welds.

4. Liquid Penetrant Inspection: ASTM E165/E165M. Liquid penetrant inspection may be used for detecting discontinuities that are open to the surface.

5. Radiographic Testing: ANSI/AWS D1.1/D1.1M, ASTM E94, and ASTM E1032, as applicable.

6. Nondestructive Testing:

a. In accordance with ANSI/AWS B1.10.

b. For Permanent and Temporary Work: in accordance with WSDOT Standard Specifications Section 6-03.3(25)A.

7. Quality of welds and standards of acceptance: In accordance with AWS D1.1/D1.1M, Sections 5, 6, and 7, as applicable.

8. Test Results: Submit test result information to the Resident Engineer immediately after test results are available, stating the acceptance or rejection of fabricated components, so that repairs and re-inspection or testing may be performed as soon as possible.

C. Shop Bolting Inspection and Testing:

1. Torque Wrench Calibration:

a. Calibrate torque wrenches in conformance with RCSC Specification.

b. Test the calibrating device for setting calibrated torque wrenches for accuracy using qualified personnel not more than 30 days prior to first use on the Work, and at intervals not more than six (6) months thereafter.

c. If the Resident Engineer finds the accuracy of the calibrating device inadequate, the Contractor must return it to the manufacturer for certification of accuracy.

D. Shop Inspections and Tests:

1. Independent verification inspection and testing at the shop must conform to requirements in Section 01 45 00 - Quality Assurance / Quality Control.

2. All welds and bolted connections are subject to inspections and testing for conformance to requirements in Section 01 45 00 - Quality Assurance / Quality Control.

PART 3 - EXECUTION

3.01 ERECTION

A. Field Bolting: Perform field bolting as specified for shop bolting.

B. Connections at Protected Zones:

1. Protected Zones are as indicated on the Issued for Construction Drawings.

2. Within protected zones, repair discontinuities created by fabrication or erection operations, such as tack welds, erection aids, air-arc gouging, and thermal cutting as required by the Issued-for-Construction Drawings and/or Resident Engineer.

3. Welded shear studs and decking attachments that penetrate the beam flange must not be placed on beam flanges within the Protected Zones. Decking arc spot welds as required to secure decking shall be permitted.

4. Welded, bolted, screwed or shot-in attachments for perimeter edge angles, exterior facades, partitions, duct work, piping or other construction must not be placed within the Protected Zone.

3.02 FIELD QUALITY CONTROL

A. All quality control measures in this specification must conform to requirements in Section 01 45 00 - Quality Assurance / Quality Control.

B. Field Welding Procedures and Personnel: Verify field welding procedures and personnel prior to and during field welding as specified for shop welding procedures and personnel.

C. Field Welding Inspection and Testing: Perform field welding inspection and testing as specified for shop welding inspection and testing.

D. Field Bolting Inspection and Testing: Perform field bolting inspection and testing as specified for shop bolting inspection and testing.

E. Verify all tests and inspections demonstrate conformance with the Issued for Construction Documents before loading structures, either temporary or permanent and submit results to the Resident Engineer.

END OF SECTION

SECTION 05 12 00

STRUCTURAL STEEL FRAMING

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for furnishing, fabricating, and erecting structural steel for building structures. Steel requirements for bridges are not included.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. American Institute of Steel Construction (AISC):

a. AISC 303 Code of Standard Practice for Steel Buildings and Bridges.

b. AISC 341 Seismic Provisions for Structural Steel Buildings.

c. AISC 358 Prequalified Connections for Special and Intermediate Steel Moment Frames for Seismic Applications, including Supplement No. 1.

d. AISC 360 Specification for Structural Steel Buildings.

2. ASTM International (ASTM):

a. ASTM A6/A6M Standard Specification for General Requirements for Rolled Structural Steel Bars, Plates, Shapes, and Sheet Piling.

b. ASTM A36/A36M Standard Specification for Carbon Structural Steel.

c. ASTM A53/A53M Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.

d. ASTM A108 Standard Specification for Steel Bar, Carbon and Alloy, Cold-Finished.

e. ASTM A252 Standard Specification for Welded and Seamless Steel Pipe Piles.

f. ASTM A307 Standard Specification for Carbon Steel Bolts, Studs, and Threaded Rod 60,000 psi Tensile Strength.

g. ASTM A435/A435M Standard Specification for Straight-Beam Ultrasonic Examination of Steel Plates.

h. ASTM A500/A500M Standard Specification for Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes.

i. ASTM A529/A529M Standard Specification for High-Strength Carbon-Manganese Steel of Structural Quality.

j. ASTM A563 Standard Specification for Carbon and Alloy Steel Nuts.

k. ASTM A572/A572M Standard Specification for High-Strength Low-Alloy Columbium-Vanadium Structural Steel.

l. ASTM A588 Standard Specification for High-Strength Low-Alloy Structural Steel, up to 50 ksi Minimum Yield Point, with Atmospheric Corrosion Resistance.

m. ASTM A992/A922M Standard Specification for Structural Steel Shapes.

n. ASTM F436 / F436M Standard Specification for Hardened Steel Washers Inch and Metric Dimensions.

o. ASTM F959 / F959M Standard Specification for Compressible-Washer-Type Direct Tension Indicators for Use with Structural Fasteners, Inch and Metric Series.

p. ASTM F1554 Standard Specification for Anchor Bolts, Steel, 36, 55, and 105-ksi Yield Strength.

q. ASTM F3125 / F3125M Standard Specification for High Strength Structural Bolts, Steel and Alloy Steel, Heat Treated, Inch Dimensions 120 ksi and 150 ksi Minimum Tensile Strength, and Metric Dimensions 830 MPa and 1040 MPa Minimum Tensile Strength.

3. American Welding Society (AWS):

a. ANSI/AWS A2.4 Standard Symbols for Welding, Brazing, and Nondestructive Examination.

b. ANSI/AWS D1.1/D1.1M Structural Welding Code – Steel.

c. AWS D1.8 Structural Welding Code – Seismic Supplement.

4. Research Council on Structural Connections (RCSC):

a. Specification for Structural Joints Using High-Strength Bolts.

5. The Society for Protective Coatings (SSPC):

a. SSPC SP 6 Commercial Blast Cleaning.

6. Washington Department of Transportation (WSDOT):

a. WSDOT Standard Specifications for Road, Bridge and Municipal Construction.

7. American Petroleum Institute (API):

a. API Specification 5L.

B. Definitions:

1. Structural Steel: Elements of structural-steel frame, as classified by AISC 303, that support design loads.

2. Seismic Load Resisting System (SLRS): Assembly of Structural Steel elements that resists seismic loads. Members of SLRS are indicated in the Issued for Construction Drawings.

3. Demand-Critical Welds: Welds in the SLRS including:

a. Complete penetration welds in beam-to-column connections, including welds to flanges, webs, and flange reinforcement, stiffener, and doubler plates.

b. Complete penetration welds of column splices and of columns to base plates.

c. Fillet welds connecting braced frame gusset plates to braces, beams, and columns.

d. Other welds indicated as “Seismic Demand Critical” on the Issued for Construction Drawings.

4. Protected Zone: See Issued for Construction Drawings for members or parts of members defined as Protected Zones, and surface of braced frame diagonal member, its gusset plates and cover plates in which restrictions apply to fabrication and attachments. Protected zones are noted on the Issued for Construction Drawings.

1.03 SUBMITTALS

A. Submit:

1. Shop Drawings:

a. Submit detailed shop drawings of structural steel work, including erection plans and piece drawings, showing member sizes, details of fabrication and construction, methods of assembly, field welding, spacing and locations of members, hardware, anchors, openings, weep holes and locations, and accessories, and erection sequence and details. Include procedures for heavy lifts and rigging.

b. Welding Procedures: Submit welding procedures and overall fabrication methods in conformance with AWS D1.1/D1.1M and AWS D1.8.

c. Include in shop drawings member identity, welding technique, cuts, copes, gussets, connections, holes, fasteners, camber, fabrication and erection tolerances, type of finish, paint system, weights of members, and critical clearances. Indicate locations of Protected Zones.

d. Indicate welds, both shop and field, using standard welding symbols of ANSI/AWS A2.4. Show the size, length, and type of each weld on drawings. Identify welds to the SLRS and Demand Critical Welds.

e. Indicate type, size, and length of bolts, distinguishing between shop and field bolts. Identify pretensioned and slip-critical high-strength bolted connections.

f. Verify all dimensions and coordinate with adjoining work.

g. Indicate individual welders' identification (ID) on record documents.

h. All shop drawings must be reviewed by and coordinated for handholes with the corresponding subcontractors.

2. Template Drawings and Placement Plans: As required for satisfactory placing of connections and anchorages.

3. Working Drawings and Method Statements:

   a. Investigate stresses caused by the proposed erection procedure.

   b. Submit the construction sequence for erection and disassembly of the shoring system. Indicate how sequence is coordinated with interim grading and drainage and the construction of the permanent structure.

   c. Submit drawings sealed by a Professional Engineer registered in the State of Washington. Show details of required temporary supports, staying, and bracing. Include descriptive data to illustrate the erection, transportation, and handling procedures, including sequence of erecting and transfer of loads if applicable.

   d. Submit calculations sealed by a Professional Engineer registered in the State of Washington supporting the drawings and other descriptive data.

   e. Furnish setting diagrams, templates, and directions for the erection of structural framing, anchor bolts, bearing plates, and other embedded items.

4. Shop testing report as required in Article 1.05 Quality Assurance, in this specification.

5. Welding Records and Data: Refer to Section 05 05 23 Metal Fastenings for the requirements as stated in the Issued for Construction Documents.

B. Transmit:

1. Product Data:

   a. Manufacturer’s product data for load-indicator washers (Compressible washer-type direction tension indicators), bolts and accessories.

   b. Data on coating system. Steel shop primer and intermediate and finish high performance coatings must be compatible between each other.

2. Certificates:

   a. At completion of fabrication, the approved fabricator must transmit a Certificate of Compliance and copy to the Building Official stating that the work was performed in accordance with the approved construction documents.

3. Mill test reports of structural steel materials, showing:

   a. Name, address and phone number of the steel manufacturer.

   b. Statement identifying the type of steel referenced on the mill certification (for example: carbon plate, ASTM A36/A36M/ASME SA36).

   c. Statement that the steel was melted and rolled in the USA.

   d. Number of pieces represented by the mill certification (for example: 6 pieces, 12 feet by 12 feet by 6 inches).

   e. Physical properties including Heat Number, Yield Strength, Tensile Strength, Percentage of Elongation, Hardness (if applicable) and Bend Tests (if applicable).

f. Chemical Analysis as applicable for each type of steel and each heat number referenced on the mill certification including Carbon, Manganese, Phosphorus, Sulfur, Silicon, Copper, Nickel, Vanadium, Columbium, Aluminum, Chromium, Molybdenum, and Cerium.

g. Signature of the person that prepared the mill certificate.

4. Qualifications:

a. Fabricator: AISC certification and current work history.

b. Erector: AISC certification and current work history.

c. Professional Engineer: License number and current work history.

5. Calibration Records:

a. Provide copies of torque wrench calibration records.

1.04 QUALITY ASSURANCE

A. Fabricator:

1. Currently certified under the AISC Certification Program, Category BU.

2. Minimum of five (5) years of experience with successfully completed structural steel work of similar complexity.

B. Erector:

1. Minimum of five (5) years of experience with successfully completed structural steel work of similar complexity.

C. Professional Engineer: Licensed professional engineer currently registered in the State of Washington.

D. Certifications of Welders: Refer to Section 05 05 23 - Metal Fastenings for the requirements.

E. Shop Testing by Contractor: Perform ultrasonic testing and visual inspection of all plate material and rolled sections greater than 1-1/2 inches in thickness and located at welded connections for discontinuities prior to fabrication. The test area is defined as a zone up to 6 inches away from the weld in the connection. These tests are in addition to the ultrasonic testing of all full-penetration welds to be performed by the Owner’s Testing Agency. Submit the testing report to the Resident Engineer. All costs associated with this testing are borne by the Contractor:

1. Ultrasonic Testing: Conduct in accordance with ASTM A435 with the following modifications and supplementary requirements:

a. Supplementary Requirements S1, including 100 percent scanning of the test.

F. Certifications of Welding Procedures: Refer to Section 05 05 23 - Metal Fastenings for the requirements.

G. Pre-Construction Conference: Schedule a job conference to review the Structural Documents prior to development of shop drawings. The conference must be attended by all pertinent parties, which is, at a minimum, to include the Fabricator, Erector, Contractor, Owner’s Testing Agency, and Structural Engineer.

1.05 DELIVERY STORAGE AND HANDLING

A. Load, transport, unload, and store structural steel materials in such a manner that the metal is kept clean and free from injury. Store materials above ground on platforms, skids, or other supports, and cover and protect from corrosion.

B. Mark weight and piece (mark) number, corresponding to shop erection sequence drawing, on all members. Match-mark all shop pre-fitted members.

C. Ship small parts, such as bolts, nuts, washers, pins, fillers, clips, and small connecting plates and anchors, in boxes, crates, or barrels, plainly mark with an itemized description of the contents on the outside of each container.

D. Pack separately each length and diameter of bolt and each size of nut and washer.

E. Avoid bending, scraping, and overstressing the steelwork. Block with wood, or otherwise protect, projecting parts that may be bent or damaged.

PART 2 - PRODUCTS

2.01 MATERIALS

A. Wide Flange Shapes:

1. ASTM A992/A992M Gr. 50.

2. AASHTO M270 Gr. 50.

B. HP Shapes: ASTM A572 Gr. 50.

C. Channels and MC shapes: ASTM A36/A36M.

D. Angles: ASTM A36/A36M.

E. Plate:

1. ASTM A36/A36M.

2. ASTM A572/A572M, Grade 50.

3. ASTM A529/A529M, Grade 50.

4. AASHTO M270 Gr. 50.

F. Hollow Structural Sections:

1. Rectangular: ASTM A500 / A500M, Grade C.

2. Round, diameter equal to or less than 20 inches: ASTM A500 / A500M, Grade C or B.

G. Pipe, diameter equal to or less than 12 inches: ASTM A53 / A53M, Grade B, Fy = 35 ksi.

H. HP shapes: ASTM A572 Gr. 50.

I. S shapes: ASTM A36.

2.02 PRODUCTS

A. Bolts: Refer to Section 05 05 23 - Metal Fastenings as stated in the Issued for Construction Documents.

B. Welding Electrodes: Conform to Section 05 05 23 Metal Fastenings as stated in the Issued for Construction Documents.

C. Unheaded anchor rods: ASTM F1554, Grade 55 unless otherwise noted on structural drawings. Finish: Plain

D. Headed anchor rods: ASTM F1554, Grade 55 unless otherwise noted on structural drawings. Finish: Plain

E. Threaded Rods: ASTM A36/A36M or ASTM F1554, Grade 55, as noted on structural drawings.

F. Shear connectors: ASTM A108, Grades 1015 through 1020, headed stud type, cold-finished carbon steel; AWS D1.1/D1.1M, Type B.

G. Fasteners: Conform to Section 05 05 23 - Metal Fastenings as stated in the Issued for Construction Documents.

H. Base Plate Shims:

1. Grouted Base Plates; Provide MB SUPER SHIMS manufactured by Meadow Burke, stainless steel shims, or approved equal.

2. Non-Grouted Base Plates; Stainless steel shims.

2.02 FABRICATION

A. Protected Zones: Do not connect to members and parts of members defined as Protected Zones in the Drawings in the protected zones and do not modify or damage as indicated below. Protected Zones occur at braced frames and members or parts of members as indicated on the Issued for Construction Drawings. Within the protected zones, the fabrication and erection must prevent the following:

1. Do not create discontinuities by fabrication or erection operations, such as tack welds, erection aids, air-arc gouging, and thermal cutting.

2. Do not place welded shear studs and decking attachments that penetrate the beam flange on beam flanges within the protected zone. Decking arc spot welds as required to secure decking are permitted.

3. Do not place welded, bolted, screwed or shot-in attachments for perimeter edge angles, exterior facades, partitions, duct work, piping or other construction within the protected zones.

B. Conform to the applicable requirements of AISC 360, AISC 341 and AISC 303.

C. Conform to Section 05 05 23 - Metal Fastenings stated in the Issued for Construction Documents.

D. Fabricate elements of the SLRS in accordance with AISC 341 and AISC 358, including supplement 1, for special and intermediate steel moment frames.

E. Prefabricate and preassemble steel members and metal fabrications in the factory or shop as far as practicable. Mark and match-mark materials for field assembly.

F. Form and fabricate the work to meet installation conditions. Include accessories to adequately secure the work in place. Be responsible for errors of fabrication and for correct fitting of structural members.

G. Center all electrical, system and mechanical handholes on the centerline of the member webs. Round all corners for handholes (radius of 2 times the web thickness).

H. Seal joined members exposed to weather by continuous welds. Grind exposed welds smooth.

I. Straighten rolled material, if necessary, before laying it out for fabrication, in a manner conforming to the mill tolerances specified in ASTM A6/A6M, and by a process and in a manner which does injure the material. Sharp kinks and bends are cause for material rejection. Do not use heat shrunk low-alloy structural steel.

J. Perform shearing, flame cutting, and chipping carefully and accurately so as not to induce residual stress in the metal being cut. Hold the radii of re-entrant gas-cut fillets not less than ¾-inch and as much larger as practicable. For cut edges exposed in the finished work, machine cut, shear, or flame cut, and grind flush in conformance with AISC 360. Maintain all working points.

K. Maintain all working points.

L. Fabricate joints which will be exposed to weather in a manner to exclude water or provide weep holes where water accumulates. Provide 1/4-inch diameter weep holes (flame cut holes are prohibited) at the low points of all vertical and diagonal HSS, pipe and tube members; at the bottoms of all horizontal HSS, pipe and tube members (minimum 2 per members).

M. Fabricate bearing stiffeners and stiffeners intended as supports for concentrated loads as indicated. Mill or grind bearing surfaces of these stiffeners.

N. Bend load-carrying cold-rolled steel plates cold at right angles to the direction of rolling. Bend such that the radius of bend, measured to the concave face of the metal, is not less than indicated in the following table, in which T is the thickness of the plate.

ANGLE THROUGH WHICH PLATE IS BENT	**MINIMUM RADIUS**
61 to 120 degrees	1.0 T
121 to 150 degrees	2.0 T

1. If a shorter radius is indicated, bend the plate hot. Before bending, round plate edges where bending occurs to a radius of 1/16-inch.

O. Bolt or weld connections as indicated on the Issued for Construction Drawings.

P. At Station Entrances, Systems Raceways, Interior Soffit Framing and any Structural Steel Framing within 20 feet of public walking surfaces, do not use screws or bolts wherever welding can be performed at connections. When using bolts connections if unavoidable, countersink heads and draw up tight; nick threads to prevent loosening.

Q. At Station Entrances, Systems Raceways, Interior Soffit Framing and any Structural Steel Framing within 20 feet of public walking surfaces, minimize Weld Show-Through where exposed to view through use of intermittent welds, selection of weld type (i.e., gas shield instead of arc), and heat dissipation techniques employed in the fabrication and assembly process.

R. Visible welds at Station Entrances, Systems Raceways, Interior Soffit Framing and any Structural Steel Framing within 20 feet of public walking surfaces: Grind flush and smooth all welds that are exposed to view at Station Entrances and meet the requirements in AWS D1.1/D1.1M, also do not project all groove and plug welds that are exposed to view more than 1/16-inch above the exposed surface and remove weld spatter at all surfaces exposed to view. In addition:

1. Make exposed joint butt tight, flush, and hairline. Ease exposed sheared edges to a radius of approximately 1/32-inch, unless otherwise indicated.

2. Form bent metal corners to smallest radius possible without causing grain separation or otherwise impairing work.

3. Seal continuous welds to close any open gaps.

4. Close all weld access holes at full penetration welds.

5. Unless otherwise indicated on the Issued for Construction drawings, weld all shop connections.

6. Grind smooth tack welds, and fill holes with weld metal and smoothed by grinding or filing.

S. Drill or punch holes at right angles to the surface of the metal. Do not flame cut holes or enlarge holes by burning. Drill holes in base or bearing plates. Provide holes in members to permit connecting the work of other trades. Punch or drill holes at 1/16-inch larger than the diameter of the bolt.

T. For high-strength bolting, assemble joints in conformance with RCSC Specification for Structural Joints and install bolts in accordance with AISC Specification for Structural Joints Using F3125/F3125M Bolts and ASTM A563 heavy hex nuts. Use hardened-face washers in conformance with ASTM F436 for all connections using F3125/F3125M bolts. Assemble joints using load-indicator washers in conformance with ASTM F959.

U. For items bearing on concrete, provide steel bearing plates and anchors. Level base or bearing plates by means of adjustment nuts and washers or permanent shims that are promptly grouted after the structural steel has been plumbed. Furnish templates, together with instructions for setting of anchors, anchor bolts, and bearing plates. Set anchors and related items properly in concrete during the progress of the work.

V. Fabricate metal bearing surfaces that contact preformed elastomeric bearing pads or grout flat to within 1/8-inch tolerance in 12 inches and to within 3/16-inch overall.

W. Include reinforcing angles, clip angles, plates, punched straps, brackets, and hangers as required to complete the work as indicated.

X. Provide drainage holes in structural components to prevent water accumulation.

Y. Where finishing is required, complete the assembly, including welding of units, before start of finishing operations. Finish surfaces of members exposed in the final structure must be free of markings, burrs, and other defects.

Z. Repair discontinuities within Protected Zones caused by fabrication operations such as tack welds, erection aids, air-arc gouging, and thermal cutting in conformance with AWS D1.8.

AA. Do not leave erection marks or other painted marks on those surfaces of weathering steel members that are to be exposed in the completed structure. Unless otherwise specified in the Issued for Construction Documents, clean weathering steel members to meet the requirements of SSPC SP 6.

BB. At Station Entrances, Systems Raceways, Station Canopies, Egress Stairs, and Interior Soffit Framing and any Structural Steel Framing within 16 feet of public walking surfaces, fill, ground or remove stamped or raised manufacturer’s identification marks.

CC. Seams of hollow structural sections is permitted as produced. Orient seams away from view or as directed in the Issued for Construction Documents.

DD. Welded Headed Stud Shear Connectors: Prepare steel surfaces as specified by manufacturer of shear connectors. Use automatic end welding of heads stud shear connectors according to AWS D1.1/D1.1M and manufacturer's written instructions.

2.03 FINISHES

A. Refer to 'Issued for Construction Documents' for finish types and Section 05 05 23 - Metal Fastenings and 09 96 00- High Performance Coatings for requirements.

2.04 WELDING

A. Shop Welding and Shop Welding Repairs: Refer to Section 05 05 23 - Metal Fastenings for welding requirements.

2.05 BOLTING

A. Shop Bolting: Refer to Section 05 05 23 - Metal Fastenings for shop bolting requirements.

2.06 SOURCE QUALITY CONTROL

A. Fabricator's Facility

1. Select a Fabricator certified by AISC.

2. Provide the Resident Engineer access to inspect the AISC-Certified Fabricator's shop or facility before the start of fabrication work. Notify the Resident Engineer in writing at least 10 days before the scheduled start of fabrication work.

B. Calibration of Torque Wrenches:

1. Check the calibrating device for setting calibrated torque wrenches for accuracy using qualified personnel not more than 30 days prior to its first use on the work, and at intervals not more than 6 months thereafter.

2. Provide copies of calibration records to the Resident Engineer. Calibrate torque wrenches as specified in the RCSC Specification for Structural Joints using F3125/F3125M Bolts.

C. Issue Non-Conformance Report (NCR) for deficiencies in work that test reports and inspections indicate non-conformance with the Issued for Construction Documents.

D. In addition to visual inspection, test and inspect shop-welded shear connectors to requirements in AWS D1.1/D1.1M for stud welding.

PART 3 - EXECUTION

3.01 ERECTION AND INSTALLATION

A. Protected Zones: Follow the same requirements as in Article 2.02.A of this Specification Section.

B. Reference Standards: Erect and install structural steel in conformance with the applicable requirements of AISC 360 and AISC 341. Hold a readiness review meeting with the parties involved with the steel erection including the Resident Engineer after shop drawings and erection plans are approved.

C. Special Care: Avoid marking or distorting the structural steel in unloading, handling, and erecting the structural steel materials. Avoid the damage to any shop paint. If using temporary braces or erection clips, avoid the creation of unsightly surfaces upon removal. Plan and execute all operations in such a manner to insure that the close fit and neat appearance of the structure.

D. Prior to erection, verify elevations of concrete and masonry bearing surfaces and locations of anchor rods, bearing plates, and other embedments, with steel erector present, for compliance with requirements. Proceed with installation only after correcting unsatisfactory conditions.

E. Lines and Levels: Install structural steel accurately at established lines and levels. Install steel plumb and level before commencing bolting. Install in accordance with accepted shop drawings and actual conditions, true and horizontal or perpendicular, level and square, with angles and edges parallel with related lines of the structure.

F. Temporary Bracing: Provide temporary bracing as required and keep in position until final completion. Brace and carefully handle shop fabricated items subject to damage to prevent distortions or other damage. Properly brace all items installed before placing concrete to prevent distortion by pressure of concrete. Watch and maintain bracing during concreting operations.

G. Bases and Bearing Plates to be Grouted:

1. Clean concrete and masonry bearing surfaces of bond-reducing materials and roughen surfaces prior to setting base and bearing plates. Clean bottom surfaces of base and bearing plates. Promptly pack grout solidly between bearing surfaces and base or bearing plates so no voids remain.

2. Set base and bearing plates accurately using a high-strength, non-shrink grouting mortar in accordance with non-shrink grouting, installation, as stated in the Issued for Construction Documents.

3. Support bases and plates that require grouting at the correct level by means of adjustment nuts and washers on anchor bolts or permanent shims that are promptly grouted after the structural steel has been plumbed.

H. Dissimilar Metals: Do not place dissimilar metals in contact with each other. Add nonmetallic spacers or other approved material between dissimilar metals, even if the metal is coated.

I. Erection and Assembly: After erection and field assembly, align the various members forming parts of the completed structure and adjust accurately before fastening. Conform to the applicable tolerance requirements of AISC 303.

J. Erect elevator hoistway structural steel support framing connection to the concrete platform structure with a sufficient time after placing and compacting station fill. Consult the project geotechnical engineer for the required time for consolidation.

K. Splice members only where indicated. Fasten splices of compression members after bringing abutting surfaces completely into contact.

L. Do not use thermal cutting during erection unless approved by the Resident Engineer. Finish thermally cut sections within smoothness limits in AWS D1.1/D1.1M. Cutting will be permitted only on secondary members, which are not under stress, as acceptable to the Resident Engineer.

M. Drift Pins: Drift pins are permitted only to bring together several parts or components. Do not use fit-up bolts and drift pins to bring out-of-tolerance fabricated members and components into alignment. Do not use drift pins with such force as to distort or damage the material.

N. Erection Connections:

1. Place holes, plates, or other attachments required by the erector so as not to interfere with or cause any other detrimental effect to structural members or connections.

2. Remove erection bolts and attachments not shown on the Issued for Construction Drawings.

3. Fill holes not shown on the Issued for Construction Drawings with plug welds and grind smooth at exposed surfaces.

O. Welded Headed Stud Shear Connectors: Prepare steel surfaces as specified by manufacturer of shear connectors. Use automatic end welding of heads stud shear connectors according to AWS D1.1/D1.1M and manufacturer's written instructions.

3.02 WELDING

A. Field Welding and Field Welding Repairs: Refer to Section 05 05 23 - Metal Fastenings for welding requirements and as stated in the Issued for Construction Contract Documents.

3.03 BOLTING

A. Field Bolting: Refer to Section 05 05 23 - Metal Fastenings for bolting requirements and as stated in the Issued for Construction Documents.

B. High-Strength Bolting: Assemble joints in accordance with AISC Specifications for Structural Joints Using ASTM F3125/F3125M Bolts.

3.04 FIELD QUALITY CONTROL

A. Field Welding Procedures and Personnel: Refer to Section 05 05 23 - Metal Fastenings and the requirements as stated in the Issued for Construction Documents.

B. Plumb, level, and align individual pieces in accordance with the requirements of AISC 303 "Code of Standard Practice for Steel Buildings and Bridges."

C. Field Survey: Make an accurate survey of alignments and elevations of all steel members as noted on the Issued for Construction drawings.

1. During construction of the steel frame, survey the column locations and splice elevations as each column tier is erected. Submit survey reports indicating this information within 24 hours after the survey for review prior to erecting the subsequent tiers.

2. Establish permanent benchmarks by a registered Professional Surveyor employed by the Contractor in accordance with the requirements of Issued for Construction Documents.

3. Where locations vary beyond the allowable tolerances, notify the Resident Engineer and take necessary corrective measures and modify details and/or procedures as required and approved.

D. Field Bolting Testing and Inspection: Refer to Section 05 05 23 - Metal Fastenings as stated in the Issued for Construction Documents.

E. Inspect field-assembled and installed high-strength bolting upon direction of the Resident Engineer. The independent laboratory must torque-test bolts in accordance with RCSC Specification for Structural Joints using F3125/F3125M Bolts.

F. Perform visual inspection and non-destructive testing (NDT) of welds in accordance with WSDOT Standard Specifications Section 6-03.3(25). For occupied structures governed by the International Building Code, inspections must conform to the International Building Code, with the exception that pedestrian structures (bridges or walkways) weld inspection must follow WSDOT Standard Specifications Section 6-03.3(25).

G. Correct deficiencies in work that test reports and inspections indicate non-conformance with Issued for Construction Documents.

3.05 PROTECTION

A. Use fire-retardant blankets to completely contain arcs and spatter associated with welding.

B. Protected Zones:

1. Refer to elsewhere in this Specification Section.

END OF SECTION

SECTION 05 30 00

METAL DECKING

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for furnishing and installing metal roof deck, composite metal floor deck, and accessories as indicated.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. ASTM International (ASTM):

a. ASTM A653/A653M Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.

b. ASTM A780/A780M Standard Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings.

c. ASTM A924 Standard Specification for General Requirements for Steel Sheet, Metallic-Coated by the Hot-Dip Process.

2. American Welding Society (AWS):

a. AWS D1.3 Structural Welding Code – Sheet Steel.

3. Steel Deck Institute (SDI):

a. SDI Publication No. 31 Design Manual for Composite Decks, Form Decks, and Roof Decks.

4. American Iron and Steel Institute (AISI):

a. AISI S100 North American Specification for the Design of Cold-Formed Steel Structural Members.

1.03 SUBMITTALS

A. Submit:

1. Shop Drawings:

a. Dimensioned deck layout noting deck type, profile, and gage.

b. Locations of and details for deck supports, laps, edges, and openings.

c. Locations of and details for deck attachments.

d. Locations of and details for deck accessories.

B. Transmit:

1. Manufacturer’s Product Data:

a. Metal Deck:

1) Profiles, properties, load and shear capacities of each type, profile, and gage used.

2) Accessories

3) Manufacturer's written instructions for storage, handling, and application.

b. Galvanizing Repair Compound:

1) Manufacturer's written instructions for storage, handling, and application.

2. Field Quality Control test and inspection reports.

3. Research/Evaluation Reports: ICC-ES or IAPMO-ES reports.

4. Qualifications of Welders as required in Section 05 05 23 - Metal Fastenings.

5. Welding Procedures as required in Section 05 05 23 - Metal Fastenings.

1.04 QUALITY ASSURANCE

A. Qualifications of Welders and Welding Procedures: Conform to Section 05 05 23 - Metal Fastenings as stated in the Issued for Construction Documents.

B. AISI Specifications: Comply with calculated structural characteristics of steel deck according to AISI S100 “North American Specification for the Design of Cold-Formed Steel Structural Members.”

1.05 DELIVERY, STORAGE, AND HANDLING

A. Store and handle products in conformance with manufacturer’s written directions.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. Deck supplier must verify deck gages and capacities based on actual deck layout and span condition. Use heavier deck gages for conditions other than these, depending on manufacturer’s layout and contractor’s layout. Submit deviations in deck gages from those shown to the Resident Engineer, along with a valid ICC-ES/IAPMO-ES report for approval, prior to shop detailing.

B. In lieu of increasing deck gages, deck shoring is permitted at Contractor’s option if acceptable to the Resident Engineer.

2.02 PRODUCTS

A. Metal Roof and Composite Floor Deck:

1. ASC Steel Deck; Product.

2. Verco Manufacturing Co.

3. United Steel Deck, Inc.

4. Wheeling Corrugating Co.

5. Epic Metals Corporation.

2.03 MATERIALS

A. Metal Roof Deck:

1. Fabricate panels without top-flange stiffening grooves in conformance with SDI Publication No. 31.

2. Sheet Steel: ASTM A653/A653M, Structural Steel, Grade 33. Galvanizing to conform to ASTM A924, G90 zinc coating where deck is left permanently exposed. Galvanizing to conform to ASTM A924, G60 in all other locations.

3. Deck Type: profile, type, and gage as indicated in the Issued for Construction Documents.

B. Composite Metal Floor Deck:

1. Fabricate panels with integrally embossed or raised pattern ribs and interlocking side laps in conformance with SDI Publication No. 31.

2. Sheet Steel: ASTM A653/A653M, Structural Steel, Grade 33. Galvanizing to conform to ASTM A924 G90 zinc coating where deck is left permanently exposed. Galvanizing to conform to ASTM A924, G60 in all other locations.

3. Deck Type: profile, type, and gage as indicated.

C. Accessories:

1. Provide closures and flashings as indicated or required for complete and finished installation and as required to prevent leakage of concrete.

2. Side-Lap Fasteners: Corrosion-resistant, hexagonal washer head; self-drilling, carbon steel screws, No. 10 minimum diameter.

3. Provide cover caps for covering abutting ends where required.

4. Provide accessories and flashings of the same material as the deck and no lighter than 22-gage. Use the deck manufacturer's standard type, galvanized accessories as follows:

a. Adjusting plates or segments of deck units in locations too narrow to accommodate full-size units.

b. End closures to close the open ends at openings through the roof, where units terminate at exterior walls, and other locations where required.

c. Sump pans at drains as indicated, fabricated from metal not lighter than 14 gage. For drains, cut holes in the field, and repair and touch up coating as stated elsewhere in the Issued for Construction Documents.

D. Welding Electrodes: Conform to metal fastenings as stated in the Issued for Construction Documents.

E. Welded Headed Studs: Conform to Section 03 15 25 - Anchorage to Concrete as stated in the Issued for Construction Documents.

F. Galvanizing Repair Compound: ASTM A780/A780M.

2.04 FABRICATION

A. Metal Deck and associated Metal Fabrications: SDI Publication No. 31.

B. Welding and Welded Connections: Conform to Section 05 05 23 - Metal Fastenings as stated in the Issued for Construction Documents.

C. Prefabricate and preassemble in the shop as far as practicable.

2.05 SOURCE QUALITY CONTROL

A. Testing and Inspection:

1. Materials, fabrications, and welding are subject to inspections in the shop. Perform testing using an approved independent testing laboratory.

2. Weld Inspection: Conform to Section 05 05 23 - Metal Fastenings as stated in the Issued for Construction Documents.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install deck panels and accessories according to applicable specifications and commentary in SDI Publication No. 31, manufacturer's written instructions, and requirements in this Section.

B. Provide deck and accessories in conformance with the approved Shop Drawings.

C. Fasten deck panels to steel supporting members by arc spot (puddle) welds of the surface diameter indicated or arc seam welds with an equal perimeter that is not less than 1-1/2 inches long, and as follows:

1. Weld Diameter: 1/2 inch, effective.

2. Weld Pattern:

a. Roof Deck: As indicated on Issued for Construction Drawings.

b. Floor Deck: As indicated on Issued for Construction Drawings.

D. Locate deck bundles to prevent overloading of supporting members.

E. Side-Lap and Perimeter Edge Fastening: Fasten side laps and perimeter edges of panels between supports, at intervals not exceeding the lesser of 1/2 of the span or 12 inches, and as follows:

1. Mechanically fasten with self-drilling, No. 10 diameter or larger, carbon-steel screws.

2. Mechanically clinch or button punch.

F. End Bearing: Install deck ends over supporting frame with a minimum end bearing of 2 inches, with end joints butted.

G. Ends of sheets shall be lapped a minimum of 2 inches over the support.

H. Position roof drain pans with flange bearing on top surface of deck. Fusion weld at each deck flute:

1. Install reinforcing channels or zees in ribs to span between supports and weld.

I. Floor-Deck Closures: Weld steel sheet column closures and Z-closures to deck, according to SDI Publication No. 31 recommendations, to provide tight-fitting closures at open ends of ribs and sides of deck.

3.02 WELDING

A. Weld deck to supports in conformance with the approved Shop Drawings.

B. Procedures: Conform to Section 05 05 23 - Metal Fastenings welding requirements as stated in the Issued for Construction Documents.

3.03 GALVANIZING REPAIR

A. Repair galvanized surfaces damaged from welding, handling, or installation immediately after installation. See shop applied coatings for metal as stated elsewhere in the Contract Documents including ASTM A780 / A780M.

B. Apply galvanizing repair compound in conformance with manufacturer's written instructions.

C. Complete all galvanizing repair before concrete is placed.

3.04 FIELD QUALITY CONTROL

A. Inspect field welds and shear studs in conformance with Section 05 05 23 - Metal Fastenings as stated in the Issued for Construction Documents.

END OF SECTION

SECTION 05 40 00

COLD-FORMED METAL FRAMING

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for cold-formed metal framing.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. American Iron and Steel Institute (AISI):

a. AISI S100 North American Specification for the Design of Cold-Formed Steel Structural Members.

2. ASTM International (ASTM):

a. ASTM A153/A153M Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.

b. ASTM A653/A653M Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.

c. ASTM C645 - Standard Specification for Nonstructural Steel Framing Members.

d. ASTM C955 Standard Specification for Cold-Formed Steel Structural Framing Members.

e. ASTM C1007 Standard Specification for Installation of Load Bearing (Transverse and Axial) Steel Studs and Related Accessories.

f. ASTM C1513 Standard Specification for Steel Tapping Screws for Cold-Formed Steel Framing Connections.

3. American Welding Society (AWS):

a. AWS D1.1/D1.1M Structural Welding Code – Steel.

b. AWS D1.3/D1.3M Structural Welding Code – Sheet Steel.

4. The Society for Protective Coatings (SSPC):

a. SSPC Paint 20 Zinc-Rich Coating Type I – Inorganic and Type II – Organic.

1.03 SUBMITTALS

A. Submit:

1. Shop Drawings: Indicate component details, framed openings, bearing, anchorage, loading, welds, and type and location of fasteners, and accessories or items required of related work:

    a. Indicate framing layout.

    b. Describe method for securing studs to tracks and for bolted framing connections.

    c. Provide design from a Professional Engineer licensed in the State of Washington with stamp and signature on shop drawings.

2. Design calculations stamped by a registered Structural Engineer for the design of cold-formed steel structural framing, and by a registered Professional Engineer for the design of nonstructural steel framing.

B. Transmit:

1. Product Data:

    a. Data on standard framing members; describe materials and finish, product criteria, limitations and span tables.

    b. Manufacturer's data on factory-made framing connectors, showing compliance with requirements.

2. Certifications:

    a. Welders and welding procedures: transmit certifications conforming to Section 05 05 23 - Metal Fastenings as stated in the Issued for Construction Documents, including WABO certification.

3. Manufacturer's Installation Instructions: Indicate special procedures, conditions requiring special attention, and any other instructions.

4. Qualifications of the following:

    a. Engineer of Record.

    b. Manufacturer.

    c. Installer.

1.04 QUALITY ASSURANCE

A. Designer Qualifications: The Engineer of Record must have at least five (5) years of experience in design of this Work and licensed in the State of Washington.

B. Calculate structural properties of framing members in accordance with requirements of AISI S100.

C. Design structural elements under direct supervision of a Structural Engineer experienced in design of this Work and licensed in the State of Washington.

D. Manufacturer Qualifications: Company specializing in manufacturing the types of products specified in this section, and with minimum three (3) years of documented experience.

E. Installer Qualifications: Company specializing in performing the work of this section with minimum five (5) years of experience.

F. Welding: Conform to Section 05 05 23 - Metal Fastenings as stated in the Issued for Construction Documents for requirements for welders, welding procedures, and inspections.

G. The work of this section is subject to testing and inspection conforming to quality assurance/quality control as stated in the Issued for Construction Documents.

H. Regulatory Requirements:

1. Framing system must meet the requirements of the local authority having jurisdiction Building Code.

2. Furnish all calculations, engineer's stamps, drawings, and other items required by the local authority having jurisdiction to obtain approval of the installation.

I. Erection Tolerances:

1. Maximum Variation from True Position: 1/4 inch.

2. Maximum Variation of all Members from Plumb: 1/8 inch in 10 feet.

3. Maximum Variation of all Members from Level: 1/8 inch in 10 feet.

1.05 PROJECT CONDITIONS

A. Verify that field measurements are as indicated on the Issued for Construction Drawings.

PART 2 - PRODUCTS

2.01 MATERIALS

A. Framing System:

1. Provide primary and secondary framing members, bridging, bracing, plates, gussets, clips, fittings, reinforcement, and fastenings as required to provide a complete framing system.

B. Framing Materials:

1. Studs and Track: ASTM C955; studs formed to channel, "C", "Sigma" shape with punched web, and specialty shapes such as CH studs; U-shaped track in matching nominal width and compatible height:

a. Gage and depth: As required to meet specified requirements in the Issued for Construction Drawings.

b. Galvanized in accordance with ASTM A653/A653M G90/Z275 coating.

c. Vertical Deflection Track: As required to accommodate structural member deflection. Refer to deflection limit specified in the project design requirements and/or Issued for Construction documents.

C. Fasteners:

1. Self-Drilling, Self-Tapping Screws must be in accordance with ASTM C1513.

2. Bolts, Nuts and Washers: Hot dip galvanized in accordance with ASTM A153/A153M.

3. Anchorage Devices: Powder actuated fasteners approved by Resident Engineer. Submit each type and size proposed for approval. Anchorage device must have the ICC report stating it can be used for seismic application.

4. Welding: In conformance with AWS D1.1/D1.1M or D1.3/D1.3M as applicable.

2.02 ACCESSORIES

A. Bracing, Furring, Bridging: Formed sheet steel, thickness determined for conditions encountered; finish to match framing components.

B. Plates, Gussets, Clips: Formed sheet steel, thickness determined for conditions encountered; finish to match framing components.

C. Touch-Up Primer for Galvanized Surfaces: SSPC Paint 20, Type I - Inorganic, complying with VOC limitations of the US Environmental Protection Agency.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Verify that substrate surfaces are ready to receive work.

3.02 INSTALLATION

A. Fasteners at Protected Zones:

1. Do not fasten to Protected Zones of steel braced frames in conformance with Section 05 5 23 - Metal Fastenings as stated in the Issued for Construction Documents.

B. Stud Framing:

1. Install components in accordance with manufacturers' instructions and ASTM C1007 and ASTM C645 requirements.

2. Place studs at no more than 16 inches on center; not more than 2 inches from abutting walls and at each side of openings. Connect studs to tracks using clip and tie method.

3. Construct corners using minimum of three studs. Install double studs at wall openings and door and window jambs.

4. Install studs full length in one piece. Splicing of studs is not permitted.

5. Install load bearing studs, brace, and reinforce to develop full strength and achieve design requirements.

6. Coordinate placement of insulation in multiple stud spaces made inaccessible after erection.

7. Install intermediate studs above and below openings to align with wall stud spacing.

8. Provide deflection allowance in stud track, directly below horizontal building framing at non-load bearing framing.

9. Attach cross studs to studs for attachment of fixtures anchored to walls.

10. Install framing between studs for attachment of mechanical and electrical items, and to prevent stud rotation.

11. Touch-up field welds and damaged galvanized surfaces with primer.

C. Soffit Joists:

1. Install framing components in accordance with manufacturer’s instructions.

2. Make provisions for erection stresses. Provide temporary alignment and bracing.

3. Place soffit joists at 16 inches on-centers; not more than 2 inches from abutting walls. Connect joists to supports using fastener method.

D. Escalator Shrouds:

1. Install shroud support components in accordance with manufacturers’ specifications and ASTM C1007 and ASTM C645 requirements.

2. Place components not more than 16 inches on center; not more than 2 inches from escalator assembly and at each side of openings. Connect studs to furring tracks using clip and tie method or other method as approved by Resident Engineer.

3. Coordinate with escalator assembly design documents and field conditions as necessary.

4. Install cross-framing between framing studs for attachment of mechanical and electrical or other items, and to prevent stud rotation.

END OF SECTION

SECTION 05 43 21

METAL STRUT FRAMING SYSTEM

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for final engineering (delegated design), furnishing and installing continuous slot, bolted metal framing channels and all associated fittings and hardware.

a. Support framing for miscellaneous items such as (including but not limited to):

1) Trapeze type supports for cable tray, conduit, pipe and other similar systems.

2) Bolted metal framing as a surface metal raceway.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. ASCE 7- Minimum Design Loads and Associated Criteria for Buildings and Other Structures

2. American Iron and Steel Institute (AISI):

a. AISI S100 North American Specification for the Design of Cold-Formed Steel Structural Members.

3. ASTM International (ASTM):

a. ASTM A653/A653M Standard Specifications for Steel Sheet, Zinc- Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.

b. ASTM A1008/A1008M Standard Specification for Steel, Sheet, Cold- Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low- Alloy with Improved Formability, Required Hardness, Solution Hardened, and Bake Hardenable.

c. ASTM B633 Standard Specification for Electrodeposited Coatings of Zinc on Iron and Steel.

d. Metal Framing Manufacturers Association (MFMA).

e. MFMA-4 Metal Framing Standards Publication.

f. MFMA-103 Guidelines for the Use of Metal Framing.

4. IBC- International Building Code.

5. The Society for Protective Coatings (SSPC):

   a. SSPC SP 6 Commercial Blast Cleaning.

6. National Fire Protection Association (NFPA).

   a. NFPA 70 National Electrical Code, Chapter 3, Article 386 "Surface Metal Raceways" and Article 388 "Surface Nonmetallic Raceways".

1.03 SUBMITTALS

A. Submit:

1. Shop Drawings: Drawings of strut and accessories including fasteners. Clamps, brackets, hanger rods, and fittings stamped by a Professional Structural Engineer licensed in the State of Washington.

2. Calculations: Calculations stamped by a Professional Structural Engineer licensed in the State of Washington. Provide calculations for struts and accessories demonstrating adequacy to support imposed loads. At a minimum, include the following:

   a. Design Criteria.

   b. Selection of framing members, fittings and accessories.

   c. Stress and deflection analysis.

   d. Reactions and imposed loads transmitted to primary structure.

B. Transmit:

1. Product Data of strut members including, but not limited to, types, materials, finishes, gauge thickness, and hole patterns. For each different strut cross- section, transmit cross sectional properties including Section Modulus (S) and Moment of Inertia (I).

2. Qualifications:

   a. Professional Structural Engineer.

   b. Manufacturers.

1.04 QUALITY ASSURANCE

A. Manufacturers: Firms regularly engaged in the manufacture of bolted metal framing of the types required, whose products have been in satisfactory use in similar service for not less than five (5) years.

B. MFMA Compliance: Comply with the latest revision of MFMA Publication No. MFMA-4.

C. NEC Compliance: Comply with the latest revision NFPA 70 – Articles 386 and 388.

D. Bolted framing channels and fittings must have the manufacturer's name, part number, and material heat code identification number stamped in the part itself for identification. Make material certification sheets and test reports available by the manufacturer upon request.

E. Pre-Installation Conference: Prior to installation, conduct Readiness Review Meeting as defined in Section 01 45 10 - Quality Assurance / Quality Control.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Deliver strut systems and components carefully to avoid breakage, denting, and scoring finishes. Do not install damaged equipment.

B. Store strut systems and components in original cartons and in clean dry space; protect from weather and construction traffic.

PART 2 - PRODUCTS

2.01 DELEGATED DESIGN REQUIREMENTS

A. Local authorities having jurisdiction Building Code.

B. American Iron and Steel Institute, AISI S100.

C. Manufacturer’s published design criteria.

D. For the metal strut system at the ceiling of the station platform, design the system to support the following loads:

1. Gravity Loads: Strut system self-weight, plus the greater of the following:

a. Uniform load of 10 pounds per square foot.

b. Uniform load of 5 pounds per square foot, plus a concentrated load of 500 pounds located to produce the maximum stress in the element being designed.

c. Actual weights of supported elements.

2. Seismic loads: Generated by the mass of the system self-weight plus the actual weights of the supported elements in accordance with IBC and ASCE 7.

3. Wind Loads: Wind pressure on the framing and components supported by the framing in accordance with IBC and ASCE 7.

E. For Metal Strut Framing Systems used for locations other than at the station platform ceiling, as indicated on the drawings, design the systems to support the following loads:

1. Gravity Loads: Strut system self-weight, plus the greater of the following:

a. A concentrated load of 250 pounds located to produce the maximum stress in the element being designed.

b. Actual weights of supported elements.

2. Seismic loads: Generated by the mass of the system self-weight plus the actual weights of the supported elements in accordance with IBC and ASCE 7.

3. Wind Loads: Wind pressure on the framing and components supported by the framing in accordance with IBC and ASCE 7.

2.02 PRODUCTS

A. Manufacturer: Subject to compliance with these specifications, install strut systems manufactured by:

1. Cooper B-Line, Inc.

2. Flex-Strut, Inc.

3. Powerstrut Corp.

4. Thomas & Betts Corp

5. Unistrut Division of Tyco, Inc.

6. Unitron Products, Inc.

2.03 MATERIALS

A. Strut Channel Framing:

1. Slotted Channel Framing: 1-5/8 inch wide cold-formed metal channels with continuous slot complying with MFMA Publication No. MFMA-4.

2. Material: Steel complying with ASTM A1008/A1008M, commercial steel, Type B; 0.0677- inch minimum thickness.

B. Fasteners:

1. Steel Bolts and Nuts: As stated in the Issued for Construction Documents.

2. Post-Installed Anchors: Anchor bolt assembly with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and four times the load imposed when installed in concrete. See Section 03 15 25 - Anchorage to Concrete and as stated in the Issued for Construction Documents.

a. Material for Anchors in Interior Locations: Carbon-steel components zinc-plated to comply with ASTM B633, Class Fe/Zn 5 is permitted, in addition to the anchor types specified in Section 03 15 25 - Anchorage to Concrete.

2.04 FINISH

A. Preparation:

1. Prepare uncoated ferrous-metal surfaces to comply with SSPC SP 6.

2. Treat prepared metal with iron-phosphate pretreatment, rinse, and seal surfaces.

B. Finish all components except fasteners with flat black coating, manufacturer's option of the following:

1. For all channels and components other than concrete inserts: Apply epoxy primer and topcoats to surfaces. Apply at spreading rates specified by coating manufacturer. See painting and coating requirements as stated in the Issued for Construction Documents.

2. For concrete inserts: Pre-galvanized zinc complying with ASTM A653/A653M.

2.05 FABRICATION

A. Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch, unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.

B. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners where possible. Use Phillips flat-head (countersunk) screws or bolts as exposed fasteners, unless otherwise indicated. Locate joints where least conspicuous.

C. Provide for anchorage of type indicated; coordinate with supporting structure. Space anchoring devices to secure metal fabrications rigidly in place and to support indicated loads.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required for installing metal fabrications. Set metal fabrications accurately in location, alignment, and elevation; with edges and surfaces level, plumb, true, and free of rack; and measured from established lines and levels.

B. Fastening to In-Place Construction: Provide anchorage devices and fasteners where metal fabrications are required to be fastened to in-place construction. Provide threaded fasteners for use with concrete and masonry inserts, toggle bolts, through bolts, lag bolts, wood screws, and other connectors.

C. Install framing and supports to comply with requirements of items being supported, including manufacturers' written instructions and requirements indicated on Shop Drawings.

D. Install strut in accordance with MFMA Publication No. MFMA-103: in accordance with equipment manufacturer's specifications, and with recognized industry practices.

E. Tighten nuts and bolts to the following values:

Bolt Size	**Torque (ft.-lbs.)**
1/4 - 20	6
5/16 - 18	11
3/8 - 16	19
1/2 - 13	50

F. Electrical grounding required for metal strut framing located within 15-foot radius of centerline of track. Conform to grounding and bonding for electrical systems installation requirements as stated in the Issued for Construction Documents.

3.02 FINISH REPAIR

A. Clean and touch up drilled holes, cuts, and minor abrasions in finishes with air dried coating that matches color and gloss and is compatible with the factory-applied finish coating as recommended by the manufacturer.

END OF SECTION

SECTION 05 52 00

METAL RAILINGS

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for metal railings outside limits of station lobby and platform as follows:

a. Emergency guardrails.

b. Metal safety railings.

c. Stair railings and guardrails as detailed on Drawings.

d. Wall-mounted handrails.

B. Delegated engineering design of metal railings and related infill panels.

C. For metal railings within limits of stations, see 05 73 00 – Decorative Metal Railings.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. Aluminum Association (AA):

a. AA DAF45 Designation System for Aluminum Finishes.

2. American Society for Testing and Materials International (ASTM).

a. ASTM A36 Standard Specification for Carbon Structural Steel.

b. ASTM A53/A53M Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.

c. ASTM A108 Standard Specification for Steel Bar, Carbon and Alloy, Cold-Finished

d. ASTM A123/A123M Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.

e. ASTM A269/A269M Standard Specification for Seamless and Welded Austenitic Stainless-Steel Tubing for General Service.

f. ASTM A312/A312M Standard Specification for Seamless, Welded, and Heavily Cold Worked Austenitic Stainless-Steel Pipes.

g. ASTM A500/A500M Standard Specification for Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes.

h. ASTM B209 Standard Specification for Aluminum and Aluminum-Alloy Sheet and Plate.

i. ASTM B211 Standard Specification for Aluminum and Aluminum-Alloy Rolled or Cold Finished Bar, Rod, and Wire.

j. ASTM B221 Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles and Tubes.

k. ASTM B241/B241M Standard Specification for Aluminum and Aluminum-Alloy Seamless Pipe and Seamless Extruded Tube.

l. ASTM B429/B429M Standard Specification for Aluminum-Alloy Extruded Structural Pipe and Tube.

m. ASTM B483/B483M Standard Specification for Aluminum and Aluminum-Alloy Drawn Tube and Pipe for General Purpose Applications

n. ASTM E935 Standard Test Methods for Performance of Permanent Metal Railing Systems and Rails for Buildings.

o. ASTM E985 Standard Specification for Permanent Metal Railing Systems and Rails for Buildings.

3. American Welding Society (AWS):

a. AWS D1.1/D1.1M – Structural Welding Code – Steel.

b. AWS D1.2/D1.2M – Structural Welding Code – Aluminum.

c. AWS D1.6/D1.6M – Structural Welding Code – Stainless Steel.

4. Authority Having Jurisdiction (AHJ) Reference Standard(s), where applicable.

B. Definitions:

1. Handrail: A railing system at trench, stairs, and walls intended for grasping by the hand for guidance or support.

2. Guardrail: A railing system at open edge of catwalks, stairs or elevated walking surfaces that minimizes the possibility of a fall from the walking surface to the lower level.

3. Emergency Guardrail: A railing system located on aerial guideways and retaining walls not open to the public.

4. Metal Safety Railing: A railing system located outside limits of stations, constructed in accordance with the standards and requirements of the Authority Having Jurisdiction.

1.03 SUBMITTALS

A. Submit the following:

1. Shop Drawings:

a. Indicate dimensions, materials, profiles, sizes, connection attachments, anchorage, size and type of fasteners, and accessories.

b. Indicate welded connections with standard AWS welding symbols. Indicate net weld lengths.

c. Include erection drawings, elevations, and details as necessary to completely show each installation.

d. Indicate fabrication and installation of handrails and railings, including plans, elevations, sections, details of components, and attachments to other units of Work.

e. Include structural analysis data sealed and signed by the qualified professional engineer who was responsible for their preparation.

2. Samples:

a. Submit four (4) each, 8-inch-long samples of handrail.

b. Submit four (4) each samples of elbow, wall bracket, and end stop.

B. Transmit the following:

1. Product Data:

a. Manufacturer's product lines of railings assembled from standard components.

b. Grout, anchoring cement, and paint products.

2. Certifications for:

a. Delegated design engineer license – Licensed in the State of Washington.

b. Welders and welding procedures: Submit certifications as specified in ”Metal Fastening” Division 05.

3. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, according to ASTM E894 and ASTM E935.

4. Preconstruction test reports.

5. Evaluation Reports: For post-installed anchors, from ICC-ES.

1.04 QUALITY ASSURANCE

A. Delegated Design Engineer: Employ a registered professional engineer, licensed in the State of Washington, to engineer structural components of the metal railing elements and connections, including attachments and anchorages. This engineer shall prepare, stamp, and sign required structural calculations; this same engineer shall also approve the fabricator's shop drawings.

B. Installer: Trained and approved by manufacturer.

C. Welding Qualifications: Qualify procedures and personnel according to the following:

1. AWS D1.1/D1.1M.

2. AWS D1.2/D1.2M

3. AWS D1.6/D1.6M.

D. Mock-Ups: Build mockups to verify selections made under Sample submittals, to demonstrate aesthetic effects, and to set quality standards for fabrication and installation:

1. Build mockups for each form and finish of railing consisting of two posts, top rail, infill area, and anchorage system components that are full height and are not less than 24 inches in length.

2. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

E. The work of this section is subject to testing and inspection conforming to quality assurance/quality control as stated elsewhere in the Contract Documents.

F. Regulatory Requirements:

1. Railings and attachment to building construction shall meet the requirements of the local authority having jurisdiction Building Code.

2. Delegated Design Data: Furnish engineering analysis, engineer's stamps, drawings, and other data for delegated design items to local authority having jurisdiction and obtain approval prior to submitting Shop Drawings.

1.05 PROJECT CONDITIONS

A. Field Measurements: Check actual locations of walls, slabs, framing, and other construction to which work of this section must fit, by accurate field measurements before fabrication; show recorded measurements on final shop drawings. Coordinate fabrication, delivery and installation schedule with construction progress to avoid delay of work.

1. Where field measurements cannot be made without delaying the Work, guarantee dimensions and proceed with fabrication of products without field measurements. Coordinate construction with work of other trades to ensure that actual dimensions correspond to guaranteed dimensions. Allow for fitting and trimming.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. Design in accordance with ASTM E985.

B. Emergency Guardrails and Free-Standing Railing at Stair On Grade: Fabricate and install in accordance with the drawings:

1. Integrated directional braille signage at handrails to comply with LEED requirements when applicable and required.

C. Metal Safety Railing: Fabricate in accordance with applicable AHJ reference standard(s) as minimum. Increase height if indicated in drawings. Increase member sizes if required to meet design requirements below.

D. Metal Safety Railing, and Wall Mounted Handrail, Structural Performance: Engineer, fabricate, and install metal fabrications to withstand the following structural loads without exceeding the allowable design working stress of the materials involved, including anchors and connections. Apply each load to produce the maximum stress in each respective component of each metal fabrication:

1. Top of handrail systems: Concentrated load at any point, of 300 pounds or uniform load of 100 pounds per lineal foot applied non-concurrently, vertically, downward, or horizontally. Concentrated and uniform loads need not be assumed to act concurrently.

2. Handrails not serving as top rails: Concentrated load at any point, of 200 pounds or uniform load of 50 pounds per lineal foot applied non-concurrently, vertically, downward, or horizontally. Concentrated and uniform loads need not be assumed to act concurrently.

3. Infill area of handrail systems: Capable of withstanding a horizontal concentrated load of 200 pounds applied to one square foot at any point in the system including panels, intermediate rails, balusters, or other elements composing the infill area.

4. Handrails: An additional load of 25 pounds per square foot (psf) acting horizontally over the entire tributary area including openings shall be applied simultaneously with the load on the top rail.

2.02 ALUMINUM RAILING MATERIALS

A. Aluminum Pipe: Schedule 40; ASTM B429, ASTM B241/B241M, or ASTM B483/B483M.

B. Aluminum Tube: Minimum wall thickness of 0.127 inch; ASTM B429, ASTM B241/B241M, or ASTM B483/B483M.

C. Rails: Minimum 1-1/2-inch diameter, extruded tubing conforming to ASTM B221.

D. Bars, sheet, and plate: ASTM B209 or ASTM B211.

E. Welding Fittings: No exposed fasteners; cast aluminum.

F. Mounting: Adjustable Brackets and flanges, with aluminum inserts for casting in concrete.

G. Straight Splice Connectors: Concealed spigot; cast aluminum.

H. Exposed Fasteners: Flush countersunk screws or bolts; consistent with design of railing.

2.03 STEEL RAILING MATERIALS

A. Steel Tube: ASTM A500, Grade B cold-formed structural tubing.

B. Steel Pipe: ASTM A53/A53M, Grade B Schedule 40, black finish.

C. Steel Flat Bars: ASTM A36 or ASTM A108

D. Welding Fittings: Factory- or shop-welded from matching pipe or tube; seams continuously welded; joints and seams ground smooth.

E. Exposed Fasteners: No exposed bolts or screws allowed.

F. Mounting: Adjustable Brackets and flanges, with steel inserts for casting in concrete.

G. Shop and Touch-Up Primer unless otherwise indicated: refer to 09 96 00 – High Performance Coatings.

2.04 STAINLESS STEEL RAILING MATERIALS

A. Tube: ASTM A269, Grade B cold-formed structural tubing.

B. Pipe: ASTM A312/A312M, Type 316, Number 4 satin finish

C. Welding Fittings: Factory or shop-welded from matching pipe or tube; seams continuously welded; joints and seams ground smooth.

D. Exposed Fasteners: No exposed bolts or screws allowed.

E. Mounting: Adjustable Brackets and flanges, with steel inserts for casting in concrete.

2.05 METAL RAIL INFILL PANELS:

A. Products selected from the following approved manufacturers, or as approved by ST as equal, as detailed on Issued for Construction drawings:

1. Ohio Gratings, Inc.

2. The Western Group.

3. Grating Pacific.

4. Hunter Douglas Architectural Products.

5. McNichols.

6. Gage Architectural Products.

B. Minimum wire and panel gauges as determined by delegated engineer to meet structural performance requirements, unless noted otherwise on Issued for Construction Drawings:

C. Include all metal Framing Members: sub-girts, zee clips, base and sill angles and channels required for a complete installation.

D. Anchors, Clips and Accessories:

1. Exposed Fasteners: Stainless Steel; permitted only where absolutely unavoidable and subject to approval by resident engineer.

2. Screws: Self-drilling or self-tapping type 410 stainless steel hex washer head.

3. Bolts, nuts, and washers: Stainless steel.

4. Provide fabricators standard corrosion-resistant accessories, including clips, fasteners, anchorage devices and attachments.

E. Include shop and field-applied high-performance coatings for all components where finish is not otherwise indicated.

2.06 FABRICATION

A. Accurately form components to suit specific project conditions and for proper connection to building structure.

B. Fabricate to comply with requirements indicated for architectural design, dimensions, details, finish, and member sizes, including wall thickness of pipe, post spacing and anchorage, but not less than that required to support all structural loads.

1. Connect members by butt welding, unless indicated otherwise.

2. Change directions by insertion of elbow fittings or by radius bends.

3. Form curved sections by rolling to produce uniform curvature indicated, without buckling, twisting, or otherwise deforming exposed surfaces of railing component.

4. Provide wall returns at ends of wall mounted handrails to eliminate any gap between rail and wall; or return railing to floor.

5. Close exposed ends of pipe by welding 3/16-inch steel plate in place or by use of prefabricated fittings.

6. For steel railings and handrails formed from steel pipe with galvanized finish, galvanize fittings, brackets, fasteners, sleeves and other ferrous components.

7. For interior steel railings formed from black steel pipe, provide non-galvanized ferrous metal fittings, brackets, fasteners, and sleeves, except galvanized anchors embedded in exterior masonry and concrete construction.

C. Provide anchors and other components as required to attach to structure, made of same materials as railing components unless otherwise indicated; where exposed fasteners are unavoidable provide flush countersunk fasteners.

1. For anchorage to concrete refer to 03 15 25 – Anchorage to Concrete.

2. For anchorage to masonry provide brackets to be embedded in masonry for bolting anchors.

3. For anchorage to metal-framed walls provide backing plates for bolting anchors.

4. Fillers: Provide steel sheet or plate fillers of size and thickness indicated or required to support structural loads of handrails where needed to transfer wall bracket loads through wall finishes to structural supports. Size fillers to suit wall finish thicknesses. Size fillers to produce adequate bearing to prevent bracket rotation and overstressing of substrate.

D. Provide welding fittings to join lengths, seal open ends, and conceal exposed mounting bolts and nuts, including but not limited to elbows, T-shapes, splice connectors, flanges, escutcheons, and wall brackets.

E. Dissimilar Metals: Provide Nylon or other manufacturer suggested gaskets at all mounting flanges, and other areas where railing system is scheduled to attach to dissimilar metals or concrete. Gaskets shall be cut to match profile of mounting flange.

F. Fit and shop assemble components in largest practical sizes for delivery to site.

G. Fabricate components with joints tightly fitted and secured. Provide spigots and sleeves to accommodate site assembly and installation.

H. Exterior Components: Continuously seal joined pieces by intermittent welds and plastic filler. Drill condensate drainage holes at bottom of members at locations that will not encourage water intrusion.

I. Interior Components: Continuously seal joined pieces by intermittent welds and plastic filler.

J. Welding: Select welding wire, method, and weld temperature to produce welds that will match color of adjacent parent material after finishing.

K. Grind exposed joints flush and smooth with adjacent finish surface. Make exposed joints butt tight, flush, and hairline.

L. Accurately form components to suit specific project conditions and for proper connection to building structure.

M. Shear and punch metals cleanly and accurately. Remove burrs.

N. Ease exposed edges to a radius of approximately 1/32 inch unless otherwise indicated. Form bent-metal corners to the smallest radius possible without causing grain separation or otherwise impairing the work.

2.07 FINISHES

A. Aluminum:

1. Finish exposed aluminum components with fluoropolymer finish (HPC-4) specified in Section 09 96 00 – High-Performance Coatings.

2. Mill Finish Aluminum: AA DAF45 M12/C12, non-specular as fabricated, chemically cleaned.

B. Stainless Steel:

1. #4 (180 grit) centerless ground.

C. Steel:

1. Include shop and field-applied high-performance coatings for all components where finish is not otherwise indicated.

2. For galvanized finish: ASTM A123/A123M

PART 3 - EXECUTION

3.01 EXAMINATION

A. Verify that field conditions are acceptable in accordance with fabricator's and/or manufacturer's instructions and are ready to receive work.

3.02 PREPARATION

A. Clean and strip primed steel items to bare metal where site welding is required.

B. Supply items required to be cast into concrete or embedded in masonry with setting templates, for installation as work of other sections.

C. Apply one (1) coat of bituminous paint to concealed aluminum, steel and stainless-steel surfaces that will be in contact with cementitious or dissimilar materials.

3.03 INSTALLATION

A. Install in accordance with fabricator's and/or manufacturer's instructions.

B. Install components plumb and level, accurately fitted, free from distortion or defects, with tight joints.

C. Anchor railings securely to structure.

D. Field weld anchors as indicated on Issued for Construction Drawings. For metals receiving finish, touch-up welds with primer. Grind welds smooth.

E. Conceal anchor bolts and screws whenever possible. Where not concealed, use flush countersunk fastenings.

F. Pipe railings and handrails: Adjust railings prior to anchoring to ensure matching alignment of abutting joints. Space posts at spacing indicated or as required by design loadings. Plumb posts in each direction. Secure posts and railing ends to building as follows:

1. Secure handrails to walls with wall brackets and end fittings. Locate brackets as indicated, or as required to support structural loads. Secure wall brackets and wall return fittings to building construction as follows:

    a. Use bracket with flange tapped for concealed anchorage to threaded hanger bolt.

    b. For concrete and solid masonry refer to 03 15 25 – Anchorage to Concrete.

    c. For hollow masonry anchorage, use toggle bolts having square heads.

G. For steel framed gypsum board assemblies, fasten brackets directly to steel framing or concealed anchors using self-tapping screws of size and type required to support structural loads.

H. Assemble with spigots and sleeves to accommodate tight joints and secure installation.

3.04 ERECTION TOLERANCES

A. Maximum Variation from Plumb: 1/4 inch per floor level, non-cumulative.

B. Maximum Offset from True Alignment: 1/4 inch.

C. Maximum Out-of-Position: 1/4 inch.

D. Offset alignment between two adjacent members abutting end to end, in line: .03 inch, maximum.

3.05 REPAIR/ RESTORATION

A. Replace damaged products as directed by Resident Engineer.

1. Exception: Field Repairs of minor damage to finishes are permitted only when approved in writing by Resident Engineer, panel manufacturer and fabricator.

2. Field repairs to Finishes: Using materials and methods sufficient that repairs are not discernable when viewed at a distance or 10 feet under typical lighting conditions.

3.06 PROTECTION

A. Protect installed products until Date of Acceptance. Protect metal finishes from damage during construction period with temporary coverings approved by panel manufacturer. Remove coverings at time of Acceptance.

END OF SECTION

SECTION 05 52 30

BARRIER CABLE SYSTEMS

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

B. Requirements for barrier cable systems in parking structures.

1.02 REFERENCES

A. Post-Tensioning Institute (PTI):

1. Technical Note 14, Design of Prestressed Barrier Cable Systems.
2. PTI M10.2 Specification for Unbonded Single Strand Tendons.
3. PTI M10.4 Specification for Seven Wire Steel Strand Barrier Cable Applications.

B. American Society for Testing and Materials (ASTM):

1. ASTM A416 Standard Specification for Low-Relaxation, seven-Wire Steel Strand for Prestressed Concrete.
2. ASTM A475 Standard Specification for Zinc-Coated Steel Wire Strand.
3. ASTM A36 Standard Specification for Carbon Structural Steel.

C. International Code Council (ICC):

1. ICC International Building Code (IBC).

D. American Society of Civil Engineers (ASCE) / Structural Engineering Institute (SEI):

1. ASCE/SEI 7 Minimum Design Loads for Buildings and Other Structures.

E. Definitions:

1. Anchorages: A mechanical device comprising all components required to anchor the prestressing steel and permanently transfer the post-tensioning force from the prestressing steel to the structure.
2. Barrel Anchor: A cylindrical metal device housing the wedges and normally used with a bearing plate to transfer the prestressing force to the concrete.
3. Barrier Strand: Seven-wire prestressing steel strand used in barrier cable systems.
4. Back-stressing: A stressing procedure that ensures that the wedges are properly seated into the anchor at a given location on the tendon.
5. Cable: A term used by some to denote a prestressing strand or a single-strand tendon.

6. Final Effective Force: Force remaining in prestressing steel after all losses have occurred.

7. Hand Seating Tool – A small handheld device used to properly align (seat) the wedges in the anchor prior to attaching the jack to the strand for stressing.

8. Initial Tensioning Force: The initial force that is applied to a barrier cable that will result in the retention of the minimum final effective force as specified by the Issued for Construction documents.

9. Jack: A mechanical device used for applying stressing force to the barrier cable.

10. Jacking Force: See Initial Tensioning Force.

11. MUTS: Minimum Ultimate Tensile Strength.

12. Seating Loss: The relative movement of the wedges into the anchor cavity during the transfer of the prestressing force to the anchorage, resulting in some loss of prestressing force.

13. Strand: High-strength prestressing steel wires helically placed around a center wire.

14. Wedges: Pieces of tapered metal with serrations, which bite into the prestressing strand during transfer of prestressing force.

1.03 SUBMITTALS

A. Submit:

1. Shop Drawings: Installation drawings including plans, elevation, section, details, and note stating that the shop drawings were prepared by or under the supervision of an installer qualified per Article 1.03.B.4, herein, detailing barrier cable layout and installation procedures including the following:

   a. Cable run arrangement, length, anchor location, anchor details and designation of barrier cables. Installation and fabrication details of all angles, posts or fabricated steel members needed and their anchoring into the structure.

   b. Stressing procedures and jacking forces to result in the final effective forces.

2. Calculations stamped by a Professional Civil or Structural Engineer licensed in the state of Washington and produced in accordance with the International Building Code and Post-Tensioning Institute, and provide a minimum of the following:

   a. Calculation of tendons minimum force for anti-sag criteria.

   b. Calculation of tendons maximum force under design loads and verification of acceptance criteria for each cable run.

   c. Verification of the maximum deflection criteria for the barrier under the design load for each significant cable.

   d. Determination of the pre-tensioning requirements to cover all criteria above including losses unless a specific procedure is in place to compensate for seating losses.

e. Load summary of permanent/accidental forces applied by the barrier for verification of their acceptability by the Resident Engineer.

f. Design calculations for all steel posts, angles or hardware used in the construction of the barrier cable. Perform the design based on design loads including direct force on steel posts used in the barrier construction.

3. Operation and Maintenance Manual: The system installer must submit a system maintenance and operations guide to Sound Transit providing a minimum of the following data:

a. Recommended inspection periodicity and procedures.

b. Maintenance and repair procedures for minor damage.

c. Maintenance procedure for cable anchors to allow for ease of maintenance and replacement without damaging existing structural elements.

d. Action plan in case of major damage impairing the system functionality.

B. Transmit:

1. Certified Mill Test Reports upon request for each coil, reel, or pack of strand containing as a minimum the following information:

a. Type and Grade.

b. Coil Number.

c. Ultimate Tensile Strength.

d. Nominal Diameter and Steel Area of Strand.

e. Modulus of Elasticity.

2. Hardware Data Sheets for each hardware component used in the cable anchoring system.

3. Stressing records filled out by testing agency during stressing operations on the cable systems:

a. Name of the project.

b. Date of approved installation drawings used for installation and stressing.

c. Date of stressing operation.

d. Weather conditions including temperature and rainfall.

e. Name of the individual in charge of stressing operation.

f. Serial or identification numbers of jacks and gauge.

g. Date of jack and gauge calibration certifications.

h. Gauge pressure to achieve required stressing force per supplied calibration chart.

i. Tendon identification mark.

j. Actual gauge pressure.

k. Representative photographs.

4. Qualifications:

a. Design and install the barrier cable system in accordance with the following:

1) Design the barrier cable system in its entirety under the responsibility of the specialty barrier cable system company.

2) The professional engineer producing the system design calculations must have a minimum experience of five (5) years and ten (10) barrier cable projects of similar size and scope.

3) Perform the installation by a PTI Certified Level 2 Installer of Unbonded Post-Tensioning with a minimum experience of five (5) years and ten (10) barrier cable projects of similar size and scope.

4) Supply the properly calibrated stressing equipment for the application and/or barrier cable systems that are necessary to perform the work. Follow calibration requirements listed in PTI's Specification for Unbonded Single Strand Tendons.

b. Prequalified Vendors:

1) Dywidag-System International, USA Inc.

2) Approved equal satisfying Article 1.03.B.4, herein this specification.

5. Warranty:

a. Provide a written warranty letter as specified in Article 1.04.A, herein this specification, at the completion of the project.

1.04 WARRANTY

A. Minimum period of five (5) years on all materials, components and their installation.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. The barrier cable system must be compliant with the International Building Code and meet the following requirements.

B. Automobile/Pedestrian:

1. Design barrier cable systems for vehicular and pedestrian design loads per ASCE 7. Perform strength verification of all the system components (cable, anchoring, hardware, posts, brackets, and structure members they attach to) with a 1.6 load factor.

2. Minimum of 42 inches in height constructed such that a 4 inch diameter sphere must not pass through any opening up to a height of 34 inches. Above 34 inches, an 8 inch diameter sphere not to pass through the openings.

3. Design deflections to insure the top rail minimum elevation of 42 inches and cable spacing (4 inch maximum up to 34 inches of the floor; then 8 inches maximum from there to 42 inches, wherever a 30 inch or greater fall risk occurs).

4. Design must conform to Post-Tensioning Institute Technical Note 14, Design of Prestressed Barrier Cable Systems.

C. Design, fabricate and install the barrier cable system, including all the system's fabricated steel components and anchoring to the structural members with a single specialty company with qualifications in compliance with paragraph Article 1.03.B.4, herein.

D. Evaluate and provide intermediate through-posts and/or cable spacers to ensure that when collision occurs, all cables act in unison without excessive vertical deflection.

E. Do not design barrier cables running through an expansion joint.

2.02 MATERIALS

A. Prestressing Steel:

1. Use seven-wire steel strand for prestressing steel barrier cable which consist of one center wire with six wires spirally wrapped around it. For vehicular applications, strand nominal diameter must be at least ½ inches and MUTS of 250 ksi or better. Single wires before galvanizing must meet the requirements of ASTM A 416, grade 250.

2. Galvanize all exposed barrier cable elements. Zinc coating must comply with ASTM specification A 475 Class A, table 2 coating weight. Apply galvanized coatings by either hot-dip or electro plating process to ensure complete zinc around each individual wire of the strand.

3. Use of polyethylene (plastic) or epoxy coated strands is not permitted.

4. Identify strand pack reels or coils at the source as to grade, coil number and type.

5. Performance Criteria:

a. Strand used for barrier cable must meet the minimum requirement of the appropriate ASTM specification as the project specification. No exception will be permitted.

b. The galvanized coating used for the barrier cable must be free of damage so that the uncoated steel is not exposed to the elements. Reject cracked or brittle coating.

B. Anchorage:

1. Design anchorages or attachments of vehicle barrier systems to be capable of transmitting vehicle loads to the structure. Design each component of the anchorage system to resist the loads that will result from both the applied prestressing force and the vehicle loads. The anchorage system includes the barrier cable terminations, the supporting structural member, and any hardware used to attach the barrier cable to its supporting structural member.

2. Design wedge type anchorage systems to develop at least 95 percent of the minimum ultimate breaking strength of the barrier cable strand and to comply with the requirements of PTI's Specification of Single Strand. Unbonded Tendons must be used at the termination of each barrier cable to attach the cable to its support member. The anchor (casting or machined barrel anchor) and the wedge is considered as one unit. Do not mix component parts from different manufacturers.

C. Barrier Cable Hardware and Embeds:

1. Encapsulated Anchors: Castings must be nonporous and free of sand, blow holes, voids, and other defects. Casting shapes are permitted to be rectangular square, or cylindrical with a conical hole designed to receive the matched tapered wedges. Use both the casting machined barrel anchors are in the same way and rate them to meet the load requirement specified. Cast or drill inserts into the support member. All inserts must meet the ultimate pull out and shear load requirements of the building code.

2. Provide galvanized hitch barriers as specified in Issued for Construction documents, mounted approximately 18 inches above finish floor to the center of the plate and centered on the stall to increase safety and protect the integrity of the barrier system.

D. Wedges:

1. Wedges are made from carbon steel bar and are hardened by heat treatment after the indentations are machined on the inside and is designed to penetrate and hold the barrier cable. The wedges must be under sufficient force to have the teeth engaged into the barrier cable to ensure proper working action of barrier cable systems. The procedures used to accomplish this task must never exceed the maximum lateral force allowed by the column. Zinc plate or galvanize wedges for corrosion resistance.

E. Bearing Plates:

1. Utilize a steel plate when required by design. See Section 05 12 00 - Structural Steel Framing for steel plate requirements. Adjust size and thickness to meet the design requirement.

F. Fabricated Structural Steel Members:

1. Design brackets or steel posts used as attachments to structural members to handle both the applied prestressing force and the forces resulting from design loads. Include the mechanical steel properties, ultimate pull out, and shear load ratings in the ultimate strength of such devices of the hardware and/or welds used in attaching the device to the supporting structural member.

2. Protect and treat the barrier system and all hardware from corrosion and such that their visibility is enhanced to patrons.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Cast-In Barrel Anchors:

1. Stress cast-in and barrel anchors with a hydraulic stressing jack to provide the specified tension in the cable after all seating losses. Backstressing according to Article 3.01.D, herein, to assure proper wedge seating.

B. Installation of Barrier Cable Through Column:

1. At intermediate columns, provide sleeves ensuring a hole which is a minimum 1/8-inch diameter larger than the barrier cable diameter used (including coating material). The concrete contractor must locate spacing and position of the cables to match the dimensions given by the vehicular barrier cable shop drawings.

2. At the end columns, recess anchors in the column prior to concrete placement or bear against the column surface (barrel anchor type). The concrete contractor must install position, spacing and reinforcing defined in the shop drawings per the barrier cable system shop drawings.

C. Structural Steel Angles & Columns:

1. Where applicable, install structural steel support or anchoring angles on the face of the column. Locate these structural members far enough from the edge of the column so as not cause concrete spalling or cracking when the cables are stressed. Develop the connections to the column to the maximum design load for all the barrier cables at the location.

2. Where applicable, install structural steel support or anchoring columns as shown in the shop drawings. Position these structural members in the proper alignment to avoid kinks in the barrier strands. Anchor steel columns to the structure prior to cable installation.

D. Stressing Considerations:

1. The licensed design engineer to specify the minimum final effective force required (after back-stressing).

2. Stress all barrier cables to the stressing forces defined in the project approved shop drawings.

3. Back-stress all anchorages. Perform this back-stressing procedure after stressing the cable. Remove the jack after achieving and placing the initial tensioning force so that the jack nose is bearing on the opposite side of the bearing member. Then stress the cable at a force equal to 80 percent of the MUTS of the strand. In concrete applications, use a slotted plate or other special nose piece to prevent damage to the concrete.

E. Finishing of Anchor Recesses

1. Remove barrier cable tails within 1 inch from the face of the column using either an oxyacetylene torch, a metal cut off sawm a hydraulic shear, or a plasma cutting device. Do not perform this operation in rainy weather.

2. Fill anchor recessing with non-metallic non-shrink grout as soon as practical, with one continuous application. Do not use the grout containing chlorides or other chemicals known to be deleterious to the steel.

3. Prior to installing the grout, clean the inside recessed concrete surfaces to remove laitance or grease in order to enhance the bond of the grout.

3.02 ADJUSTING

A. Seat wedges initially at 80 percent MUTS into the barrel housing to ensure engagement of the wedge teeth into the barrier cable. The final force of the barrier cable is achieved mechanically through the threading adjustment at the stem of the anchoring device into the insert. Backstress the cable installed in these devices in accordance with Article 3.01.D, herein, either before or after the installation of the anchor.

3.03 FINAL INSPECTION & PROTECTION

A. At anchorage columns, seal the hold at the barrier cable that passes through a hole in the column to anchorage to prevent water from following a path of barrier cable to the anchorage unless the barrier cable slope prevents that from happening.

B. When cable tension is in question, perform tension verification by means of an approved cable tension gauge without removing or damaging the cables.

C. Sound Transit requires independent special inspection to ensure barrier cable system is installed in accordance with the Issued for Construction Documents and installation drawings. Special inspector must verify the conformance to the requirements of Article 2.01.B.2, herein, and Article 2.01.B.3, herein this specification. Special inspector must submit inspection report to Sound Transit.

END OF SECTION

SECTION 07 08 00

COMMISSIONING OF BUILDING ENCLOSURE

NOTE TO DESIGNER:

SECTIONS WITH BRACKETS. E.G., [TEXT] ARE TO BE MODIFIED OR DELETED IF NOT APPLICABLE. ITALICIZED TEXT PROVIDES INSTRUCTION TO THE DESIGNER TO INCLUDE LANGUAGE ON SPECIFIC TOPICS WHEN APPLICABLE. THE INSTRUCTIONS ARE TO BE DELETED WHEN THE SPECIFICATION IS FINALIZED. LANGUAGE NOT IN BRACKETS IS TO BE USED ‘AS IS’ WITHOUT MODIFICATION OR WITH AN APPROVED SPECIFICATION MODIFICATION REQUEST.

DESIGNER TO DELETE TEXT ABOVE FOR FINAL SECTION

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Requirements for the commissioning process for Building Enclosure:

a. Level 1 commissioning process requirements for building enclosure at select mechanically conditioned rooms.

1) [List locations of mechanically conditioned room based on the facility design]

b. Support for Level 2 commissioning activities for Building Enclosure.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. ASTM International (ASTM):

a. ASTM E779 Test Method for Determining Air Leakage Rate by Fan Pressurization.

B. Definitions:

1. See general commissioning requirements as stated in the Contract Documents for commissioning definitions.

1.03 COORDINATION

A. See general commissioning requirements as stated in the Contract Documents [Reference Section 01 91 13 – General Systems Testing and Commissioning Requirements if CM accepts] for general coordination requirements related to commissioning.

B. Coordinate amongst building trades, electrical trades and mechanical trades for completion of penetrations and readiness of room integrity. Performance of air barrier test to be coordinated based on function and requirements.

1.04 COMMISSIONING ACTIVITIES

A. Furnish labor and material to accomplish building commissioning as specified in general commissioning requirements as stated in the Contract Documents and in this specification, including:

1. Provide to the Testing and Commissioning Manager preliminary O&M information for use in developing commissioning test procedures.

2. Assist the Testing and Commissioning Manager in developing commissioning activity procedures and data forms submittals for work specified in this Section.

3. Provide information to the Testing and Commissioning Manager needed for control interface wiring diagrams submittals for the work of this Section.

4. Perform Level 1 commissioning activities specified in this Section, including installation verification, static tests, start-up tests, component tests, systems tests.

5. Operate equipment and system during commissioning activities as required by the Testing and Commissioning Manager.

6. Perform and document commissioning tests to verify readiness for commissioning test demonstration. Commissioning tests are specified in this specification.

7. Correct issues and repeat commissioning tests when results do not meet acceptance criteria.

8. Commissioning Test Demonstrations: General requirements for commissioning test demonstrations are specified in general commissioning requirements as stated in the Contract Documents:

   a. Repeat commissioning tests on a sample basis to demonstrate acceptable performance: Level 1 Component, Equipment, and System Commissioning Tests.

   b. Record and submit commissioning test demonstration data and issues.

   c. Correct issues and repeat commissioning test demonstration when results do not meet Acceptance Criteria.

9. Attend commissioning meetings as requested by the Testing and Commissioning Manager.

10. Report any inconsistencies or issues in system operations or performance.

11. Provide personnel to support commissioning test demonstration specified and as requested by the Testing and Commissioning Manager.

    a. In the event that a commissioning test demonstration fails, assist in determining the cause of failure. Make corrections as necessary.

B. Cooperate with Testing and Commissioning Manager to accomplish commissioning work on schedule and in coordination with other trades.

1.05 QUALITY ASSURANCE

A. Coordinate completion of Install Verification forms, by the Quality Control Inspector, as identified in the Contractors Quality Control Inspection and Test Plan.

PART 2 - PRODUCTS

2.01 TEST EQUIPMENT

A. Provide test equipment and instrumentation, including consumable supplies, required to execute commissioning activities. Unless noted otherwise, test equipment and instrumentation remain the property of the Contractor.

2.02 PROPRIETARY TEST INSTRUMENTS

A. Provide proprietary test instruments or tools required by the equipment manufacturer. Provide and operate the proprietary test instruments or tools as required for commissioning work.

PART 3 - EXECUTION

3.01 LEVEL 1 COMMISSIONING ACTIVITIES REQUIREMENTS

A. Level 1 commissioning activities scope: Technical requirements for commissioning of Equipment are specified in this specification.

B. Provide technicians, instrumentation, and tools to perform commissioning activities in accordance with accepted commissioning activity procedures at the direction of the Testing and Commissioning Manager.

C. Scope of Equipment commissioning activities applies to all portions of the installation described in the test. Where sampling is specified, it applies only to the commissioning test demonstration.

D. Upon approval of product submittals associated with the Technical requirements and the scope of Commissioning develop and submit for approval Install Verification Checklist forms for the quality criteria of the Work specified in this specification.

E. Preparation:

1. Certify that Equipment, subsystems, and equipment have been completed, calibrated, and started; and are operating in accordance with Contract Documents.

2. Testing Instrumentation: Install measuring instruments and logging devices to record test data in accordance with accepted commissioning test procedures as directed by the Commissioning Authority.

3. Certify that Equipment instrumentation and control systems have been completed and calibrated; are operating according to the Contract Documents; and that pretest set points have been recorded.

F. If tests cannot be completed because of a deficiency outside the scope of the Equipment system, document the deficiency and report it to Sound Transit. After deficiencies are resolved, reschedule tests.

G. Where seasonal testing is specified, complete appropriate initial commissioning tests and documentation within the Construction Period. Schedule and execute seasonal tests when specified conditions are expected.

3.02 LEVEL 1 COMMISSIONING ACTIVITY PROCEDURES

A. Submit level 1 commissioning activity test procedures and data forms for the following types of commissioning activities, requirements for which are specified in this specification.

1. Level 1 commissioning activities:

   a. Installation verification.

   b. System tests.

   c. [*Review identified IV's, E and S tests and add or modify as necessary based on location design for envelope systems]*

   d. Example checklists/test forms can be provided upon request.

3.03 LEVEL 1 INSTALLATION VERIFICATION REQUIREMENTS

A. Installation verification checklists are required for the following, minimum:

   1. Water and Air Barriers including those at mechanically conditioned rooms and rooms protected by chemical fire suppression identified to be tested under Articles 3.04.A, in this specification.

   2. Installation of doors and hardware complete

   3. Completion of conduit and duct installation

   4. Completion of joint and penetration firestopping systems

B. Installation verification checklist forms shall include the following:

   1. Organized to prompt the installer to check off quality criteria for each discrete portion of the Work.

   2. Identify the system or features to which the installation verification checklist applies at the top of the form.

   3. Section for verification of delivery of accepted materials.

   4. Section for verification that installation meets contract documentation and any special installation instructions by respective manufacturer.

   5. Space at the end of the form for the installer to print their name and company name, fill in the date, and sign or initial.

   6. Space at the end of the form for the Quality Control inspector designated for the scope to review and accept installation verification. QC Inspector must perform Install Verification and verify each element identified in form has been reviewed for conformance with contract documents and in accordance with the Contractors Quality Control Inspection and Test Plan as part of Section 01 45 00 - Quality Assurance/Quality Control.

   7. Space to identify the area of work for which the installer is executing the Installation Verification Checklist.

   8. Description of the quality criteria as it pertains to the specific work. Include a check-box for each criterion.

C. Quality Criteria: Installation verification checklists shall address the following quality criteria:

   1. Material matches accepted submittals and Contract Documents.

   2. Systems are installed without visible damage.

3. Location is as indicated on drawings.

4. Equipment is accessible for maintenance using safe work practices.

5. There is sufficient space to remove and replace components intact without demolishing other work.

6. Room construction is complete, providing a complete envelope for room and weather integrity.

7. Envelope construction is complete.

8. Door installation is complete.

9. Penetrations and sleeves for other trades are completed and have ducts or conduits installed.

10. Conduit or duct penetrations and sleeves have been appropriately sealed, proper application of firestop or closed off if unused to provide envelope integrity.

D. Fill out and sign installation verification checklists for Equipment while the Work is being installed. The intent is to fill out and sign the installation verification checklist as work proceeds to improve the quality of the installation. Retain completed installation verification checklists on site for review.

E. Before performing a commissioning test, installation verification checklists must be performed and completed by QC inspector designated for the appropriate area specified here in and within the Contractors Quality Control Inspection and Test Plan as part of Section 01 45 00 - Quality Assurance/Quality Control. Submit completed installation verification checklists for work included in the commissioning test.

3.04 LEVEL 1 INSTALLATION VERIFICATION

A. 0708-IV-01: Water and Air Barriers including those at mechanically conditioned rooms and rooms protected by chemical agents identified to meet room integrity tests. *[Designer: Reference a code sheet, drawing of conditioned rooms or provide as an appendix, a list of rooms to be tested]*.

1. [Designer: Identify water barrier applications, such as membranes, roofing etc. IV to serve as an ID to collate and collect Quality checks from various Division 07 specifications for the barrier to act as a complete system.]

2. [*Designer: Identify air barrier applications, wall material, finishes etc. IV to serve as an ID to collate and collect Quality checks from various Division 07 specifications for the barrier to act as a complete system*.]

B. 0708-IV-02: Completion of conduit and duct installation:

1. Penetrations and sleeves for all trades are completed and have ducts or conduits installed.

C. 0708-IV-03: Completion of joint and penetration firestopping systems per Contract Documents:

1. Conduit or duct penetrations and sleaves have been appropriately sealed, proper application of firestop or closed off if unused to provide envelope integrity.

D. [*Review identified IV's, E and S tests and add or modify as necessary based on location design for envelope systems. IV's and S test for Stations are typically conditioned rooms* *and rooms protected by dry chemical suppression agents that require room integrity. Consideration for LEED application and credits will also warrant identification of scope]*

3.05 LEVEL 1 SYSTEM TESTS

A. 0708-S-01 Weather and Air Barrier Test:

1. System to be tested: Air barrier compliance testing as [required by the state or Seattle energy code dependent upon project] as specified in water and air barriers requirements as stated in the Contract Documents.[*Designer: Identify conditioned rooms subject to energy code or necessary for LEED credits]*

2. Test Method: ASTM E779:

a. Measure indoor and outdoor temperatures. If the difference between outdoor and indoor temperatures is too large, then the test shall not be performed due to the effects of the pressure difference.

b. Test pressure range must be from 25-80 Pa with the upper limit ≥50 Pa and the difference between the upper and lower limits ≥25 Pa. Room will be pressurized and depressurized (may also just use pressurization) gradually within the specified pressure range. Airflow and pressure differences will be measured periodically at pressure intervals of 5 to 10 Pa.

3. Acceptable Results:

a. Identified rooms shall be tested and the air leakage rate of the building envelope shall not exceed 0.40 cfm/ft^2 at a pressure differential of 0.4 inches water gauge (2.0L/s m^2 at 75 Pa) at the upper 95 percent confidence interval in accordance with ASTM E779 or an equivalent method approved by the code official.

b. If the tested rate exceeds that defined here, a visual inspection of the air barrier shall be conducted, and any leaks noted shall be sealed to the extent practicable and the test must be repeated. An additional report identifying the corrective actions taken to seal air leaks shall be submitted to the building owner after a minimum of 1 re-test and the code official and any further requirement to meet the leakage air rate may be waived (per AHJ Energy Code).

4. Report: Prepare a written report documenting the following information:

a. Building description, including location, address (street, city, state or province, zip or postal code, country, and elevation [above mean sea level in m (feet)].

b. Construction, including date built (estimate if unknown), floor areas for conditioned space, attic, basement, and crawl space, and volumes for conditioned spaces, attic, basement, and crawl space.

c. Condition of openings in building envelope including:

1) Doors, closed, locked or unlocked.

2) Windows, closed, latched or unlatched.

3) Ventilation openings, dampers closed or open.

4) Chimneys, dampers closed or open, and a

5) Statement whether the test zone is interconnected with at least door-sized openings. If not, the results of pressure measurements between portions of the zone.

d. HVAC system, including the location and sizes of ducts that penetrate the test zone envelope.

e. Procedure, including the test equipment used (manufacturer, model, serial number), and calibration records of all measuring equipment.

f. Measurement data, including:

1) Fan pressurization measurements (inside-outside zero flow building pressure differences); inside and outside temperature (at start and end of test) and the product of the absolute value of the indoor/outdoor air temperature difference multiplied by the building height; tabular list of all air leakage measurements and calculations: time, building pressure difference, air density, nominal airflow rate, fan airflow rate, and air leakage rate; and deviations from standard procedure.

2) Wind speed/direction and whether wind speed is estimated or measured on site. When measured on site, record the height above the ground at which wind speed was measured.

g. Calculations, including:

1) The leakage coefficient and pressure exponent for both pressurization and de-pressurization in accordance with ASTM E779.

2) The effective leakage areas for pressurization, depressurization, and combined. Report if a reference pressure other than 4 Pa is used; and

3) An estimate of the confidence limits in accordance with ASTM E779, Section 9.7.

3.06 LEVEL 1 AND LEVEL 2 TEST REQUIREMENTS MATRIX

SECTION 07 19 10

WATER AND GRAFFITI REPELLENTS

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for surface preparation and application of the following:

a. Graffiti-resistant coatings to interior and exterior surfaces within the “touch zone”, and where specifically noted on the drawings.

1) For multi-coat systems, where the first coat(s) comprise the permanent water repellant, and subsequent coats are applied to achieve graffiti-repellent properties, the water repellant coat(s) are required for the full extent of the surface to be covered, and subsequent graffiti-repellant coats are required only for areas within the touch zone, or as otherwise indicated on the Issued for Construction Drawings, as allowed by the manufacturer.

2) For surfaces indicated to receive graffiti-resistant coating, as well as high performance coating or paint specified elsewhere in the Contract Documents: Provide a compatible anti-graffiti top coat.

b. Water repellents for interior and exterior wall surfaces.

c. Water repellent sealers for exterior traffic surfaces, and interior floor surfaces.

d. Water repellent pigmented sealers on concrete surfaces.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. Washington Administration Code (WAC):

a. Chapter 173-490 WAC Emission Standards and Controls for Sources Emitting Volatile Organic Compounds (VOC).

2. Revised Code of Washington (RCW):

a. Chapter 70A.15 RCW Washington Clean Air Act.

3. American Society for Testing and Materials International (ASTM).

a. ASTM D6578 – Standard Practice for Determination of Graffiti Resistance.

b. ASTM E303 - Standard Test Method for Measuring Surface Frictional Properties Using the British Pendulum Tester.

1.03 SUBMITTALS

A. Submit:

1. Product Data: Provide product description. Include data substantiating that material is recommended by manufacturer for applications indicated.

2. Manufacturer's Installation Instructions: Indicate special procedures and conditions requiring special attention; cautionary procedures required during application.

3. Shop Drawings: Plan and Elevation drawings indicating extent and type of coating to be applied, including height of anti-graffiti coating where applied to partial-height walls. Indicate termination of sealers at construction and control joints and joints in masonry where applicable.

4. Written statement from manufacturer attesting to compatibility of the WGR coating and all substrates/ coatings applied to substrates:

   a. Include results of sample testing required by the manufacturer to demonstrate compatibility between previously untested substrates or coatings.

B. LEED Submittals:

1. Where LEED certification is required by the project, submit the same documentation for approval as required by GBCI as a project submittal. Highlight the relevant LEED information.

2. LEED documentation is to be submitted separately and titled LEED SUBMITTAL.

3. Building Product Disclosure and Optimization credit data: Submit data to support the LEED SUBMITTAL.

C. Transmit:

1. Field inspection reports.

2. Test results for Mock-ups indicating passing Pendulum Test Value per ASTM E 303, as defined in Article 2.1.

3. Qualifications:

   a. Applicator Qualification.

   b. Additional applicator Certification required by the manufacturer.

4. Maintenance Data: In addition to requirements stated elsewhere, include graffiti removal and cleaning instructions with written and video or digital medium showing cleaning procedure, including recommended proprietary products, and expected lifespan of permanent coatings.

5. Warranties: Samples of each manufacturer's warranties.

D. LEED Submittals:

1. Where LEED certification is required by the project, submit the same documentation for approval as required by GBCI as a project submittal. Highlight the relevant LEED information.

2. LEED documentation is to be submitted separately and titled LEED SUBMITTAL.

3. Building Product Disclosure and Optimization credit data: Submit data to support the LEED SUBMITTAL.

1.04 QUALITY ASSURANCE

A. Applicator's Qualifications: Company specializing in performing the work of this Section approved by manufacturer, and employing experienced persons trained and approved by repellent manufacturer for application of materials and issuance of special warranty.

B. Mock-ups:

1. Prepare representative surfaces 6 feet by 6 feet in size using specified materials. (Concrete – Vertical and Horizontal, Painted Metal Panel, Stainless Steel Panel, Brick, Painted Steel, and CMU).

2. Demonstrate preparation and application of repellents and coatings on each type of surface, identical to those to be coated, to establish standards for workmanship and aesthetic effects:

a. Indicate surface preparation procedures, coverage rates, application methods equipment.

1) Allow graffiti-resistant coatings to dry for one week or for amount of time recommended by manufacturer prior to testing of adhesion. If adhesion is poor, light abrasion of the surface or other methods recommended by the manufacturer may be necessary before reapplying coating and retesting adhesion.

b. Notify Resident Engineer, 24 hours in advance of graffiti removal tests.

c. Apply spray paint, permanent marker, lipstick, and grease. Allow applied markings to set for a minimum of 24 hours before removal attempts.

d. Demonstrate materials and methods to be employed for the removal of the above on graffiti-resistant coatings.

e. Cleaned surface of graffiti-resistant coatings shall be undamaged, and free of “shadows,” “ghosts” or similar defects in appearance.

3. Locate mock-ups where directed by Resident Engineer:

4. Slip Resistance: Test horizontal surface mock-ups after application of sealers to demonstrate a Pendulum Test Value (PTV) as listed in 2.1.4 per ASTM E303. For surfaces not meeting the required results, consult with manufacturer for remedial requirements, and correct mock-up until a passing result is achieved.

5. Approved mock-ups may remain as part of the Work as determined by the Resident Engineer.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Deliver materials to site in sealed, original, labeled containers bearing manufacturer's name, type of material, brand name, and instructions for mixing. Store materials off-ground, and under cover. Conform to additional manufacturer’s written instructions regarding storage and handling of materials.

B. The Resident Engineer reserves the right to inspect the containers prior to their opening, to review accompanying bills of lading, and to reject materials in opened containers.

1.06 PROJECT CONDITIONS

A. Weather and Substrate Conditions: Do not proceed with application of repellents and coatings when the following conditions exist, unless otherwise indicated in manufacturer's written instructions:

1. Ambient temperature is less than 40 degrees Fahrenheit or above 100 degrees Fahrenheit.

2. When rain or temperatures below 40 degrees Fahrenheit are predicted for a period of 24 hours, or earlier than three (3) days after surfaces become wet from rainfall or other moisture sources.

3. When substrate is frozen, or at surface temperature of less than 40 degrees Fahrenheit.

4. When winds are sufficient to carry airborne chemicals to unprotected surfaces or adjacent properties or would cause an improper application rate.

1.07 WARRANTY

A. Special Warranty: Two years for Graffiti-Resistant Coatings.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. GENERAL

1. Compatibility: Repellent and coating materials shall be compatible with substrate surfaces and other materials they are in contact with.

2. Maximum VOC Content: Comply with Washington State Air Quality Rules and Laws, Chapter 173-490 WAC Emission Standards and Controls for Sources Emitting Volatile Organic Compounds (VOC), Chapter 70A.15 RCW Washington Clean Air Act, and LEED requirements, whichever is more stringent.

3. Graffiti-Resistance: Minimum Level 6, minimum 25 cycles without loss of repellency per ASTM D 6578.

4. Slip Resistance: Sealers applied to walking and vehicular traffic surfaces must demonstrate tested wet pendulum test values (hard rubber slider) Tested in accordance with ASTM E 303 of the following:

a. Parking garage decks (interior): 36.

b. Parking garage decks (exterior): 45.

c. Loading Docks or vehicle maintenance areas: 55.

d. Ramped and sloped surfaces: 55.

e. Other surfaces not listed: Min 36.

B. WGR-1: Non-Sacrificial Graffiti-Resistant and Water Repellent for Interior and Exterior Concrete and Masonry Walls.

1. Description: RTV Silicone resin based, penetrating type, 15 percent solids content: maximum 250 g/L VOC content, colorless:

a. Acceptable Manufacturers: Subject to compliance with requirements provide products from one of the following:

1) ProSoCo, Inc.

2) Master Builder's Solutions.

3) Professional Products of Kansas, Inc.

4) Sherwin-Williams.

C. WGR-2: Non-sacrificial graffiti-resistant topcoat for application over surfaces with painting or coating systems specified elsewhere in the Contract Documents:

1. Use of proposed WGR-2 topcoat shall be approved in writing by the base coating manufacturer.

2. Follow the manufacturer's recommendations for scheduling of WGR-2 application to ensure the base coating system has cured and will accept application of topcoat without adverse effects to adhesion or performance of either coating.

3. Provide written confirmation of compatibility demonstrated through field tests and mock-ups as required elsewhere in this section.

a. Acceptable formulations, include:

1) Single component, Polysiloxane, high solids Maximum VOC <250 g/L.

2) Silane, penetrating type, Min 40 percent alkylalkoxysilane, Maximum VOC 50g/L.

3) Polyurethane, high solids, Maximum VOC 100g/L.

b. Acceptable manufacturers, Subject to compliance with requirements provide products from one of the following:

1) PPG.

2) Sherwin-Williams.

3) Prosoco, Inc.

4) Evonik.

5) Master Builder's Solutions.

D. WGR-3: Water Repellent for Precast Concrete Pavers, exposed, Concrete and Concrete Masonry Walls, Concrete Decks:

1. Description: Clear, modified silane /siloxane penetrating solution; low volatility, containing 100 percent alkytrialkoxysilanes; maximum 400 g/L VOC content. Traffic-bearing where subject to vehicle traffic:

a. Abrasion resistance, mg lost; (ASTM D 4060) 48 — system passes Max: 50 CS-17 Wheel, 1,000 g load, 1,000 cycles.

2. Acceptable Products:

a. ProSoCo Inc.

b. Sherwin-Williams.

c. Laticrete International.

d. Master Builder’s Solutions.

E. WGR-4: Water Repellent for Concrete floors below-grade and slab on grade:

1. Description: Clear, Silane, penetrating water repellent, containing 100 percent alkoxysilanes; maximum 400 g/L VOC content. Vehicular-Traffic Bearing:

a. Abrasion resistance, mg lost; (ASTM D 4060) 48 — system passes Max: 50 CS-17 Wheel, 1,000 g load, 1,000 cycles.

b. Acceptable Manufacturers: Subject to compliance with requirements provide products from one of the following:

c. ProSoCo, Inc.

d. Laticrete International: Aquapel.

e. Master Builder’s Solutions.

f. Sika.

F. WGR-5: Vehicular traffic coating for parking garage decks and ramps, primary entrances, and closure strips:

1. Description: Cold fluid-applied elastomeric crack-bridging traffic-bearing coating system, 100 percent solids by volume, maximum VOC Content 400 g/L.

a. Meet requirements of ASTM C957.

b. Abrasion resistance, mg lost; (ASTM D 4060) CS-17 Wheel, 1,000 g load, 1,000 cycles: Max 16 mg.

c. Include primer and reinforcing fabric and texture top coat or integral texture as required by manufacturer to meet wear and slip-resistance requirements.

2. Ensure compatibility between WGR-4 and joint/crack sealants used in accordance with other divisions of the specifications:

a. Acceptable Manufacturers: Subject to compliance with requirements provide products from one of the following.

b. SIKA.

c. Sherwin Williams.

d. Master Builder’s Solutions.

G. WGR-6: Water-Repellent Pigmented Sealer for Concrete:

1. On guideway concrete walls, piers, columns, abutments and MSE walls, superstructure at Station areas, TPSS basement walls, and other concrete elements indicated on the Issued for Construction Drawings:

a. Comply with WSDOT Standard Specifications for Road, Bridge, and Municipal Construction, Section 9-08.3 Pigmented Sealer Materials for Coating of Concrete Surfaces.

b. Color: Washington Gray.

c. Acceptable Products: Per WSDOT Qualified Products List.

2. Parking Garage Concrete Vertical wall and column surfaces:

a. Methyl methacrylate-ethyl acrylate, semi-opaque co-polymer resign-based sealer.

b. Color selected by ST.

c. Acceptable Products:

1) Basis of Design: Sherwin Williams: DOT sealer 100.

2) Other products complying with WSDOT Standard Specifications Section 9-08.3.

d. Apply compatible WGR-2, anti-graffiti topcoat to vertical surfaces full height:

1) WGR-2 top coat shall be approved in writing by WGR-5 manufacturer. Compatibility demonstrated through field tests and mock-ups as required elsewhere in this section.

2) Follow the manufacturer's recommendations for scheduling of top-coat application to ensure pigmented sealer has cured and will accept application of top-coat without adverse effects to adhesion or performance of either coating.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Verify existing conditions before starting work, including:

1. Joint sealants are installed and fully cured.

2. Masonry mortar is cured a minimum of 60 days.

3. Surfaces to be coated are dry, clean, and free of efflorescence, oil, or other material detrimental to performance of work.

B. Inspect surfaces in presence of repellent manufacturer's authorized technical representative and Applicator.

C. Do not proceed with treatment application until unsatisfactory conditions have been corrected.

D. Concrete Substrates: Cure a minimum of 28 days. Where required by the manufacturer, test concrete for moisture vapor emission values in accordance with manufacturer's instructions,

3.02 PREPARATION

A. Clean surfaces of dirt, oils, efflorescence, mildew staining, and other contaminants in accordance with manufacturer’s written instructions.

B. Test surfaces for moisture content in accordance with manufacturer’s written instructions. Allow damp or wet surfaces to dry.

C. Remove contaminants using methods acceptable to repellent manufacturer and Resident Engineer.

D. Notification Prior to Final Application: Notify Resident Engineer at least 24 hours in advance of performing work to witness final application. Clearly mark panels, which have received test applications.

E. Protection of Surfaces:

1. Protect adjoining work from spillage or overspray of repellents. Cover adjoining and nearby surfaces of aluminum, glass and planting where there is possibility of graffiti-resistant coatings being deposited on surfaces. Cover surface mounted items.

2. Clean treatments from unintended surfaces immediately after spillage or overspray. Comply with manufacturer’s recommendations for cleaning. Cleaning materials and methods employed shall be such so as not to damage surfaces and permanent finishes.

3.03 WATER AND GRAFFITI REPELLENT APPLICATION

A. Apply repellents in accordance with manufacturer’s directions.

B. Test each surface and/or material to be treated to ensure compatibility and desired water and graffiti-resistant treatment results. The surface to be treated must be clean and free of all foreign matter and as dry as possible to ensure proper penetration of water and graffiti-resistant treatment.

C. Ensure thorough saturation of porous surfaces of concrete and similar surfaces. Do not dilute or alter materials.

D. Apply repellents at coverage rates and in number of coats determined on test applications.

E. Apply treatment evenly until surfaces are fully wet, starting at the bottom and working up with a 6 to 8 inches rundown below the contact point of the spray pattern, unless otherwise recommended by repellent manufacturer.

F. Finished surface to be even, uniform in texture and appearance and free of runs and drips.

G. Use brushes or rollers where spray method may damage adjacent surfaces.

3.04 FIELD QUALITY CONTROL

A. Manufacturer’s Field Services: Engaged repellent manufacturer’s factory-trained, authorized technical representative to perform field inspections and tests:

1. Arrange for Resident Engineer and Applicator to be present during tests.

2. Prior to preparing mock-ups, obtain and test samples required by the manufacturer for previously untested substrates or for evaluation for compatibility with other coatings in accordance with warranty requirements.

3. Tests: Determine suitable application to each type of substrates before installation. Review substrate conditions, surface preparation procedures, coverage rates, application methods equipment. Notify Resident Engineer, 24 hours in advance of tests.

4. Inspections during Application: Representative to be present during first day of application and periodically as recommended by manufacturer to ensure compliance of quality of execution of manufacturer's written instructions.:

   a. Review exposed substrates prior to application.

5. Prepare and submit inspection test reports, coordinated in accordance with warranties.

3.05 CLEANING

A. Remove and dispose of masking and protective materials.

B. Remove over spray from adjacent surfaces with cleaner as recommended by the repellent manufacturer without damage to surfaces.

3.06 PROTECTION

A. Protect treated surfaces from traffic, rain, and other surface water in accordance with repellent manufacturer’s written instructions.

END OF SECTION

SECTION 07 92 00

JOINT SEALANTS

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for sealant and backing materials for sealing of joints in construction. In general this includes, but is not limited to, the following:

   a. All locations noted on Issued for Construction Drawings as sealant or caulking, excluding joint fillers indicated by 03 15 00 – Concrete Accessories.

   b. Penetrations in exterior metal wall panel systems.

   c. Perimeter joints between exterior metal wall panel systems and door frames, aluminum windows, or louvers.

   d. Horizontal/Vertical architectural control, construction, isolation, and expansion and contraction joints.

   e. Perimeter joints between interior wall surfaces and frames of doors or windows.

   f. Tape for isolation and gasketing as indicated.

   g. As required for continuous Weather Air Barrier at penetrations of exterior walls.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. Fenestration and Glazing Industry Alliance (FGIA/AAMA) AAMA 800 - Voluntary Specifications and Test Methods for Sealants.

2. American Society for Testing and Materials International (ASTM):

   a. ASTM C834 - Standard Specification for Latex Sealants

   b. ASTM C920 - Specification for Elastomeric Joint Sealants.

   c. ASTM C1193 - Standard Guide for use of Joint Sealants.

   d. ASTM C1311 - Standard Specification for Solvent Release Sealants.

   e. ASTM C1330 - Standard Specification for Cylindrical Sealant Backing for Use with Cold Liquid-Applied Sealants.

   f. ASTM C1521 - Standard Practice for Evaluating Adhesion of Installed Weatherproofing Sealant Joints.

g. ASTM E84 - Standard Test Method for Surface Burning Characteristics of Building Materials.

3. South Coast Air Quality Management District (SCAQMD):

a. SCAQMD Rule 1168 - Adhesive and Sealant Applications, with Amendments.

4. Underwriters Laboratories Inc. (UL):

a. UL 94 HF-1 - Measure of a material's flammability or burning time before self-extinguishment (burning stops within 2 seconds; afterglow less than 30s; no burning drips allowed).

1.03 SUBMITTALS

A. Submit:

1. Sealant Schedule: Identify areas of use by each product submitted according with Sealant Schedule in this Section:

a. Product Data: Submit manufacturer's technical datasheets for each product to be used; include the following:Physical characteristics, including movement capability, VOC content, hardness, cure time, and color availability.

1) List of backing materials approved for use with the specific product.

2) Substrates that product is known to satisfactorily adhere to and with which it is compatible.

3) Substrates the product should not be used on.

4) Substrates for which use of primer is required.

5) Substrates for which laboratory adhesion and/or compatibility testing is required.

6) Installation instructions, including precautions, limitations, and recommended backing materials and tools.

7) Sample product warranty.

8) Certification by manufacturer indicating that product complies with specification requirements.

2. Samples for Initial Selection: Submit initial color samples in the form of manufacturer's bead samples consisting of strips of actual products showing full range of colors available for each product.

3. Material Certification: Submit written certification from sealant manufacturer stating that materials forming joint substrates and joint backings (e.g., concrete, fluoropolymer coatings) have been tested for compatibility and adhesion with proposed joint sealants and are suitable for the use intended as specified; certification shall state that proposed sealant has been tested for non-staining characteristics when applied to precast concrete. Include recommendations for primers and substrate preparation needed to obtain adhesion.

4. Adhesion Test Log: Submit sample of test log containing requirements listed in Article 3.04, herein.

B. LEED Submittals:

1. Where LEED certification is required by the project, submit the same documentation for approval as required by GBCI as a project submittal. Highlight the relevant LEED information.

2. LEED documentation is to be submitted separately and titled LEED SUBMITTAL.

3. Building Product Disclosure and Optimization credit data: Submit data to support the LEED SUBMITTAL.

1.04 QUALITY ASSURANCE

A. Single Source Responsibility: Obtain joint sealant materials for each application from a single manufacturer.

B. Sealant Certification: Submit written certification from sealant manufacturer stating that materials forming joint substrates and joint backings (e.g., concrete, fluoropolymer coatings) have been tested for compatibility and adhesion with proposed joint sealants and are suitable for the use intended as specified; certification shall state that proposed sealant has been tested for non-staining characteristics when applied to precast concrete. Include recommendations for primers and substrate preparation needed to obtain adhesion.

C. Preconstruction Compatibility and Adhesion Testing: Prior to installation of joint sealants, field test their adhesion to joint substrates of each type encountered and determine if priming and other specific joint preparation techniques are required. Perform tests under normal environmental conditions that will exist during actual installation in accordance with Field Quality Control requirements in this section. Schedule sufficient time for testing and analysis of results to prevent delay in the progress of the Work.

1.05 PROJECT CONDITIONS

A. Environmental Conditions: Do not proceed with installation of joint sealants under the following conditions:

1. Ambient and substrate temperature conditions are outside the limits permitted by joint sealant manufacturer.

2. Joint substrates are wet due to rain, condensation, or other causes.

3. Joint Width Conditions: Do not proceed with installation of joint sealant when joint widths are less than or larger than allowed by joint sealant manufacturer for application indicated.

4. Joint Substrate Conditions: Do not proceed with installation of joint sealants until contaminants capable of interfering with their adhesion are removed from joint substrates.

1.06 WARRANTY

A. Special Installer's Warranty: Installer agrees to repair or replace joint sealants that do not comply with performance and other requirements specified in this Section within specified warranty period.

B. Verify available warranties and warranty periods for joint-sealant installation.

1. Warranty Period: Two (2) years from date of Acceptance.

C. Special Manufacturer's Warranty: Manufacturer agrees to furnish joint sealants to repair or replace those joint sealants that do not comply with performance and other requirements specified in this Section within specified warranty period.

D. Verify available warranties and warranty periods for joint sealants:

1. Warranty Period: Five (5) years from date of Acceptance.

PART 2 - PRODUCTS

2.01 MATERIALS

A. Compatibility: Provide joint sealants, joint fillers, and other related materials that are compatible with one another and with joint substrates under conditions of service and application, as demonstrated by sealant manufacturer based on testing and field experience.

B. Color And Texture Criteria (Exterior Exposed to View Locations): Unless noted otherwise provide color of joint sealant selected from manufacturer's standard colors to match adjacent colors, as selected by Architect.

1. At Color Coated (PVDF) Aluminum Framing: Provide custom color to match the Resident Engineer's approved (PVDF) color sample.

2. Sealants (Type B) used in horizontal applications shall match adjacent material color.

C. Surface Burning Characteristics: All materials used within the building envelope must meet Smoke developed index of 450 or less, and flame spread index of 25 or less, Class A, when tested in accordance with ASTM E84.

D. Sealants used within the building envelope shall comply with low VOC limits found in SCAQMD Rule 1168.

2.02 PRODUCTS

A. Sealants:

1. Type "A" Sealant: One-part, neutral-cure silicone elastomeric sealant meeting requirements of ASTM C920, Type S, Grade NS, Class 25 minimum. Include primer required for porous substrates as required by manufacturer:

a. Application: Exposed exterior vertical and horizontal joints not subject to foot or vehicle traffic.

b. Acceptable products include:

1) Dow Corning "DOWSIL 795/790 Building Sealant".

2) General Electric "Silglaze SSG4000".

3) Tremco “Spectrem 2”.

4) or approved equal.

2. Type “B” Sealant: Self-leveling 2-part elastomeric urethane meeting requirements of ASTM C920, Type M, Grade P, Class 25 minimum, Use T. Include primer required for porous substrates as required by manufacturer:

a. Application: Interior and exterior horizontal joints subject to foot or vehicle traffic.

b. Acceptable products include:

1) SIKA USA, Sikaflex-2c SL.

2) BASF “MasterSeal SL 2”.

3) BASF “MasterSeal NP2”.

4) Tremco “Vulkem 445SSL”.

5) Or approved equal.

3. Type "C" Sealant: Silyl-terminated polyether (STPe) or polyurethane (STPu) elastomeric sealant conforming to requirements of ASTM C920, Type S, Grade NS, Class 50 minimum. Include primer required for porous substrates as required by manufacturer:

a. Applications: Metal to metal open joints, either back groove or top of surface mounted flashing, exposed to weather, and for bedding thresholds and brake formed flashings.

b. Acceptable products include:

1) BASF "Sonolastic 150 VLM"

2) Henry Company "HE925 - BES Sealant"

3) Pecora Corporation, “DynaTrol I-XL Hybrid”

4) Or Accepted Equal

4. Type "D" Sealant: One part paintable acrylic latex sealant complying with requirements of ASTM C834, type OP:

a. Applications: Low-movement, interior joints not subject to traffic, and not in wet areas:

1) Joints in gypsum drywall, concrete, and masonry.

2) Wall and ceiling control joints at non- fire rated non-acoustic conditions.

3) Other interior joints for which no other type of sealant is indicated.

b. Acceptable products include:

1) Pecora Chemical Corporation "AC-20 + Silicone".

2) Tremco "Tremflex 834".

3) Sherwin-Williams “850A”.

4) or approved equal.

5. Type "E" Sealant: One part mildew resistant silicone sealant complying with requirements of ASTM C920, Type S, Grade NS, Class 25 minimum:

a. Applications: Interior joints in wet areas (perimeter of countertops with sinks, restrooms, and shower areas).

b. Acceptable products include:

1) Dow Corning "Dowsil 786 Silicone Sealant".

2) General Electric "SCS1702".

3) Pecora Corporation “898 Sanitary Mildew Resistant Silicone Sealant”.

4) or approved equal.

6. Type "F Series" Sealants: Non-curing, non-hardening, synthetic rubber sealer, recommended for use by manufacturer where concealed joints are subject to changes in temperature, water and vibration.

a. Type "F-1": Tape consistency, solvent-free, butyl-based sealant with a solids content of 100 percent; meeting the requirements of AAMA 804.1-85 (as described in AAMA 800). Packaged in rolls with release paper backing:

1) Acceptable products include:

a) Tremco "440 Tape".

b) Pecora, "Extru-Seal".

c) C.R. Laurence Butyl Architectural Glazing Tape.

d) Or approved equal.

2) Applications: Exterior metal to metal, and dissimilar materials, compression joints subject to shear.

b. Type "F-2": Mastic consistency, one-part non-drying, non-hardening, non-bleeding and permanently resilient butyl sealant, meeting or exceeding ASTM C1311, AAMA 809.2 (as described in AAMA 800):

1) Acceptable products include:

a) SIKA ‘SikaLastomer 511”.

b) Pecora, “BA-98”.

c) Tremco “TremPro JS-773+t”.

d) Or approved equal.

2) Applications: Exterior metal to metal laps, concealed compression joints, door thresholds, bottom of steel stud tracks.

a) For sealing of steel stud tracks in acoustical and fire-rated applications, refer to Section 09 21 16 - Gypsum Board Assemblies.

B. Secondary Seal:

1. Application: Compression seal to provide watertight secondary seal and resist air pressure differential behind primary sealant and backer-rod at elevator hoistway joints.

2. Refer to Drawings for size of joint.

3. Acceptable Products include:

a. Emseal, Backerseal or accepted equal.

C. Tapes:

1. PVC Tape (Type "H"): closed cell PVC foam tape with self-adhesive backing.

a. Typical application: Gasket/sealant to reduce air movement, acoustical and vibration isolation and between dissimilar materials and elsewhere indicated.

b. Basis of design: Saint Gobain “Norseal V740”, or approved equal.

D. Compression Seal:

1. Expanding Foam Tape (Type “J”): self-expanding polyurethane foam impregnated with modified acrylic flame retarding polymer meeting UL 94 HF-1 (Self-Extinguishing).

2. Typical application: For joints on exterior concrete and masonry envelope and secondary seal for interior side of window to WAB.

3. Acceptable Products Include:

a. Tremco Willseal 600/600S.

b. Bosig “Combband 600”.

c. Approved Equal.

E. Acoustic and Fire-Rated Sealant: Refer to Section 09 21 16 - Gypsum Board Assemblies.

2.03 ACCESSORIES

A. Plastic Foam Backer Rod: ASTM C1330. Preformed compressible, resilient, non-waxing, non-extruding foam, of size, shape and density to suit various conditions and control sealant depth and width. Provide open or closed cell as recommended by sealant manufacturer.

B. Backer rod type recommended for compatible with sealant by sealant manufacturer, and of type which does not cause staining or discoloration of joint based on field experience and laboratory testing.

C. Sizes as recommended by sealant manufacturer, with diameter never less than 30 percent greater than width of joint.

D. Bond Breaker Tape: Polyethylene tape or other plastic tape as recommended by sealant manufacturer for preventing bond between sealant and back surface of joint. Provide self-adhesive tape wherever applicable.

E. Primer: Provide type recommended by joint sealer manufacturer where required for adhesion of sealant to joint substrates indicated.

F. Cleaners for Nonporous Surfaces: Provide non-staining, chemical cleaner of type acceptable to manufacturer of sealant and sealant backing materials, which are not harmful to substrates and adjacent nonporous materials, and which do not leave oily residues or otherwise have a detrimental effect on sealant adhesion or in-service performance.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine joints indicated to receive joint sealants, with Installer present, for compliance with requirements for joint configuration, installation tolerances and other conditions affecting joint sealant performance. Do not proceed with joint sealer work until unsatisfactory conditions have been corrected.

3.02 PREPARATION

A. Cleaning of Joints: Clean joints immediately before installing joint sealers to comply with recommendations of joint sealer manufacturers and the following requirements:

B. Remove protective films from metal surfaces. Clean metal, glass, and other nonporous surfaces by chemical cleaners or other means which are not harmful to substrates or leave residues capable of interfering with adhesion of joint sealants.

C. Jointing Priming: Prime joint substrates where recommended by joint sealer manufacturer based on preconstruction compatibility and adhesion testing or prior experience. Apply primer undiluted in uniform coating over surface. Confine primers to areas of joint sealer bond; do not allow spillage or migration onto adjoining surfaces.

D. Masking Tape: Apply masking tape around joints where required to prevent contact of sealant with adjoining surfaces which otherwise would be stained or damaged by such contact or by cleaning methods required to remove sealant smears. Remove tape immediately after tooling without disturbing joint seal.

3.03 SEALANT APPLICATION

A. General: Comply with joint sealer manufacturer's printed installation instructions applicable to products and applications indicated, except where more stringent requirements apply.

B. Installation Standards: Comply with recommendations of ASTM C1193 for use of joint sealants as applicable to materials, applications and conditions indicated.

C. Installation of Sealant Backings:

1. Install backer rods in all butt type joints receiving sealant where depth of joint exceeds manufacturer's recommendations. Install joint filler using a blunt tool or plain faced roller. Do not puncture, stretch, or twist joint fillers.

2. Do not leave gaps between ends of joint fillers. Remove joint fillers that become wet prior to sealant application and replace with dry material.

3. Generally, install joint fillers to achieve width-to-depth ratio as recommended by sealant manufacturer. Where depth of joint is not sufficient to require joint filler, install bond breaker tape to cover full width and length of joint cavity to prevent three sided adhesion.

D. Joint Width: Width-to-depth ratio of sealant as recommended by sealant manufacturer. Do not exceed a depth of 1/2 inch when joint is 1/2 inch wide; joints exceeding 1/2 inch in width shall not exceed 1/4 inch in depth.

E. Mixing: Mix two component sealant in accordance with manufacturer's directions using premeasured units. Do not thin or adulterate sealant in any way.

F. Installation of Sealants: Apply sealant over backing to uniform thickness in continuous beads, filling all joints and voids solid; superficial pointing with skim bead will not be accepted. Use nozzle of proper size to completely fill the joints.

G. Tooling of Nonsag Sealants: Immediately after sealant application and prior to time skinning or curing begins, tool sealants to form smooth, uniform beads, free of air pockets; ensure contact and adhesion of sealant with sides of joint. Remove excess sealants from surfaces adjacent to joint:

1. Provide concave joint configuration, unless noted otherwise.

2. Do not use tooling agents which discolor sealants or adjacent surfaces or are not approved by sealant manufacturer.

H. Pourable sealants shall be applied by gun or by pouring, filling the joint completely with a slight recessed finish. Additional material shall be added if low spots develop. Seal along outside slab edges of joints to prevent water from entering cavity formed by backer rod.

3.04 FIELD QUALITY CONTROL

A. Field Testing and Inspection: Perform field test of joint sealant in accordance with test recommended in ASTM C1521: Standard Practice for Evaluating Adhesion of Installed Weatherproofing Sealant Joints, except as modified below:

1. All testing to be witnessed by Resident Engineer or designated representative.

2. Extent of Testing: Test sealant joints as follows:

a. Perform single test for each type of sealant and joint substrate for each responsible contractor.

b. Test joints to be 5 feet long.

c. Allow sealants to cure fully before testing.

3. Test Method: Test joint sealants by hand-pull method described below:

a. Make knife cuts from one side of joint to the other, followed by two cuts approximately 2 inches long at sides of joint and meeting cross cut at one end. Place a mark 1 inch from cross-cut end of 2-inch piece.

b. Use fingers to grasp 2-inch piece of sealant between cross-cut end and 1-inch mark; pull firmly at a 90-degree angle or more in direction of side cuts while holding a ruler alongside of sealant. Pull sealant out of joint to the distance recommended by sealant manufacturer for testing adhesive capability, but not less than that equaling specified maximum movement capability in extension; hold this position for 10 seconds.

c. For joints with dissimilar substrates, check adhesion to each substrate separately by extending cut along one side, checking adhesion to opposite side, and then repeating this procedure for opposite side.

B. Inspect joints for complete fill, for absence of voids, and for joint configuration complying with specified requirements. Record results in a field adhesion test log.

1. Inspect tested joints and report on the following:

a. Whether sealants in joints connected to pulled-out portion failed to adhere to joint substrates or tore cohesively. Include data on pull distance used to test each type of product and joint substrate. Compare these results to determine if adhesion passes sealant manufacturer's field- adhesion hand-pull test criteria.

b. Whether sealants filled joint cavities and are free from voids.

c. Whether sealant dimensions and configurations comply with specified requirements.

C. Record test results in a field adhesion test log. Include dates when sealants were installed, names of persons who installed sealants, test dates, test locations, whether joints were primed, adhesion results and percent elongations, sealant fill, sealant configuration, and sealant dimensions.

D. Repair sealants pulled from test area by applying new sealants following same procedures used to originally seal joints. Ensure that original sealant surfaces are clean and new sealant contacts original sealant.

E. Evaluation of Field-Test Results: Sealants not evidencing adhesive failure from testing or noncompliance with other indicated requirements, will be considered satisfactory. Remove sealants that fail to adhere to joint substrates during testing or to comply with other requirements. Retest failed applications until test results prove sealants comply with indicated requirements.

3.05 CLEANING

A. Clean off excess sealants or sealant smears adjacent to joints as the Work progresses by methods and with cleaning materials approved in writing by manufacturers of joint sealants and of products in which joints occur.

END OF SECTION

SECTION 08 08 00

COMMISSIONING OF OPENINGS

NOTE TO DESIGNER:

SECTIONS WITH BRACKETS. E.G., {TEXT} ARE TO BE MODIFIED OR DELETED IF NOT APPLICABLE. ITALICIZED TEXT PROVIDES INSTRUCTION TO THE DESIGNER TO INCLUDE LANGUAGE ON SPECIFIC TOPICS WHEN APPLICABLE. THE INSTRUCTIONS ARE TO BE DELETED WHEN THE SPECIFICATION IS FINALIZED. LANGUAGE NOT IN BRACKETS IS TO BE USED 'AS IS' WITHOUT MODIFICATION OR WITH AN APPROVED SPECIFICATION MODIFICATION REQUEST.

DESIGNER TO DELETE TEXT ABOVE FOR FINAL SECTION

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Requirements for commissioning process for Openings:

a. Level 1 commissioning activities for Openings.

b. Level 2 commissioning activities for Openings.

c. Support for Level 3 commissioning activities related to Openings.

d. Support for Level 4 commissioning activities related to Openings.

1.02 REFERENCES

A. Definitions

1. Definitions: See general commissioning requirements as stated in the Contract Documents for commissioning definitions.

2. Systems, Equipment, and Components: Where these terms are used together or separately, they shall mean "as-built" systems, equipment, and components.

1.03 COORDINATION

A. See general commissioning requirements as stated in the Contract Documents for general coordination requirements related to commissioning.

B. Coordinate completion of Install Verification forms, by the Quality Control Inspector, as identified in the Contractors Quality Control Inspection and Test Plan.

1.04 COMMISSIONING ACTIVITIES

A. Furnish labor and material to accomplish building commissioning as specified as part of general commissioning requirements as stated in the Contract Documents, and including, but not limited to:

1. Provide to the Testing and Commissioning Manager Preliminary O&M information for use in developing commissioning test procedures.

2. Assist the Testing and Commissioning Manager in developing commissioning activity procedures and data forms for work specified in this Section.

3. Provide information to the Testing and Commissioning Manager needed for Control Interface Wiring Diagrams for the work of this Section.

4. Perform Level 1 and Level 2 commissioning activities specified in this Section, including installation verification, static tests, start-up tests, component tests, and systems tests, and intrastation system interface tests.

5. Provide support for Level 3 commissioning activities, including jointly with the communications system contractor field testing points in the interface terminal strips, being present during Level 3 testing with adequate labor and support personnel to adjust equipment and troubleshoot system failures that might arise. When material or equipment provided by this Division is found to be in conflict with specified criteria, adjust or replace said material or equipment, with the assistance of manufacturer as needed.

6. Operate equipment and system during Commissioning Tests and Commissioning Test Demonstration indicated.

7. Perform and document Commissioning Tests indicated to verify readiness for Commissioning Test Demonstration.

8. Correct issues and repeat Commissioning Tests when results do not meet Acceptance Criteria.

9. Commissioning Test Demonstrations: General requirements for commissioning test demonstrations are specified in general commissioning requirements as stated in the Contract Documents:

   a. Repeat commissioning tests on a sample basis to demonstrate acceptable performance: Level 1 Component, Equipment, and System Commissioning Tests.

   b. Record and submit commissioning test demonstration data and issues.

   c. Correct issues and repeat commissioning test demonstration when results do not meet Acceptance Criteria.

10. Attend commissioning meetings as requested by the Testing and Commissioning Manager before and during testing indicated.

11. Report any inconsistencies or issues in system operations or performance.

12. Provide personnel to support Commissioning Test Verification indicated, as requested by the Testing and Commissioning Manager.

13. In the event that a Commissioning Test Demonstration fails, assist in determining the cause of failure. Make corrections as necessary.

B. Cooperate with Testing and Commissioning Manager to accomplish commissioning work on schedule and in coordination with other trades.

1.05 QUALITY ASSURANCE

A. Coordinate completion of Install Verification forms, by the Quality Control Inspector, as identified in the Contractors Quality Control Inspection and Test Plan.

PART 2 - PRODUCTS

2.01 TEST EQUIPMENT

A. Provide test equipment and instrumentation, including consumable supplies, required to execute commissioning activities. Unless otherwise indicated, test equipment and instrumentation remain the property of the Contractor.

PART 3 - EXECUTION

3.01 LEVEL 1 COMMISSIONING ACTIVITIES REQUIREMENTS

A. Level 1 commissioning activities scope: Technical requirements for commissioning of Equipment are specified in this specification.

B. Provide technicians, instrumentation, and tools to perform commissioning activities in accordance with accepted commissioning activity procedures at the direction of the Testing and Commissioning Manager.

C. Scope of Equipment commissioning activities applies to all portions of the installation described in the test. Where sampling is specified, it applies only to the commissioning test demonstration.

D. Upon approval of product submittals associated with Technical requirements and the scope of Commissioning, develop and submit for approval Install Verification Checklist forms for the quality criteria of the Work indicated.

E. Preparation:

1. Certify that Equipment, subsystems, and equipment have been completed, calibrated, and started; and are operating in accordance with Contract Documents.

2. Testing Instrumentation: Install measuring instruments and logging devices to record test data in accordance with accepted commissioning test procedures as directed by the Commissioning Authority.

3. Certify that Equipment instrumentation and control systems have been completed and calibrated; are operating according to the Contract Documents; and that pretest set points have been recorded.

F. Test all operating modes, interlocks, control responses to abnormal or emergency conditions, and verify proper response of building automation system controllers and sensors.

G. Perform tests using design conditions wherever possible. If tests cannot be completed because of a deficiency outside the scope of the Equipment system, document the deficiency and report it to Sound Transit. After deficiencies are resolved, reschedule tests.

H. Simulated conditions may need to be imposed using an artificial load when it is not practical to test under design conditions. Provide equipment to simulate loads. Set simulated conditions in accordance with accepted commissioning test procedures as directed by the

Testing and Commissioning Manager. Document simulated conditions and methods of simulation. After tests, return settings to normal operating conditions.

I. Request approval to alter set points when simulating conditions is not practical. Request approval to alter sensor values with a signal generator when design or simulating conditions and altering set points are not practical.

J. Where seasonal testing is specified, complete appropriate initial commissioning tests and documentation within the Construction Period. Schedule and execute seasonal tests when specified conditions are expected.

3.02 LEVEL 1 AND LEVEL 2 COMMISSIONING ACTIVITY PROCEDURES

A. Submit Level 1 commissioning activity test procedures and data forms for the following types of commissioning activities, requirements for which are specified in this specification:

1. Level 1 commissioning activities:

a. Installation verification.

b. Start-up.

c. System tests.

2. Level 2 commissioning activities:

a. Intra-station system interface tests.

3. Example checklists/test forms can be provided upon request.

3.03 LEVEL 1 INSTALLATION VERIFICATION CHECKLIST REQUIREMENTS

A. Scope: Installation verification requirements to the following:

1. Access Doors and Panels.

2. Overhead Coiling Grilles and Vertical Lift Doors.

3. Hollow Metal Doors and Frames.

4. Door Hardware.

5. Fire Key Boxes.

B. Installation Verification Checklist Forms: Include the following:

1. Organized to prompt the installer to check off quality criteria for each discrete portion of the Work.

2. Identify the system or features to which the Installation Verification Checklist applies at the top of the form.

3. Section for verification, and condition of delivery of approved materials.

4. Section for verification that installation meets contract documentation and any special installation instructions by respective manufacturer.

5. Space at the end of the form for the Quality Control inspector designated for the scope to review and accept installation verification. QC Inspector must perform Install Verification and verify each element identified in form has been reviewed for conformance with contract documents and in accordance with the Contractors

Quality Control Inspection and Test Plan as part of Section 01 45 00 - Quality Assurance/Quality Control.

6. Space at the end of the form for the installer to print their name and company name, fill in the date, and sign or initial.

7. Space to identify the area of work for which the installer is executing the Installation Verification Checklist.

8. Description of the quality criteria as it pertains to the specific work. Include a check box for each criterion.

C. Quality Criteria: Installation Verification Checklists: Include the following checkable items:

1. Make and model match approved submittals.

2. Equipment is installed without visible damage.

3. Location is as indicated on drawings.

4. Equipment is accessible for maintenance using safe work practices.

5. There is sufficient space to remove and replace components intact without demolishing other work.

D. Fill out and sign installation verification checklists for Equipment while the Work is being installed. The intent is to fill out and sign the installation verification checklist as work proceeds to improve the quality of the installation. Retain completed installation verification checklists on site for review.

E. Before performing a commissioning test, installation verification checklists must be performed and completed by QC inspector designated for the appropriate area specified here in and within the Contractors Quality Control Inspection and Test Plan as part of Section 01 45 00 - Quality Assurance/Quality Control. Submit completed installation verification checklists for work included in the commissioning test.

3.04 LEVEL 1 INSTALLATION VERIFICATION

A. Provide installation verification checklists for the following, as a minimum requirement:

1. 0808-IV-01 Access Doors and Panels, including, but not limited to, as required:

a. Fire rating.

b. Cylinders and keying.

2. 0808-IV-02 Overhead Coiling Grilles or Vertical Lift Doors, including, but not limited to:

a. Electric operators and drives, including maintenance access.

b. Cylinders and keying.

c. Fit and alignment.

d. Wiring preparation.

3. 0808-IV-03 Hollow Metal Doors and Frames, including, but not limited to, as required:

a. Hardware and wiring preparation.

b. Thermal resistance.

c. Fire rating.

d. Smoke and draft rating.

e. Grouting.

f. Adjustment.

4. 0808-IV-04 Door and Gate Hardware, including, but not limited to:

a. Marking, packaging, and secure storage of delivered hardware.

b. Cylinders and keying.

c. Electrified locksets.

d. Exit devices.

e. Door closers.

f. Gasketing and thresholds.

g. Key boxes.

h. Installation in accordance with Contract Documents.

i. Installation in accordance with approved submittals, including wiring diagrams, operational descriptions, elevation drawings, and connector configurations.

j. Auxiliary components listed in door hardware requirements as stated in the Contract Documents.

5. 0808-IV-05 Fire-Rated Openings:

a. Installation in accordance with certification(s) of compliance with applicable provisions of UL10C Standard for Positive Pressure Fire Tests of Door Assemblies.

3.05 LEVEL 1 START-UP REQUIREMENTS

A. 0808-SU-01: Overhead Coiling Grilles or Vertical Lift Doors:

1. System/Equipment to be Tested:

a. Overhead coiling grilles in accordance with overhead coiling grilles as stated in the Contract Documents.

2. Functions to be Tested:

a. Start-up of overhead coiling grilles.

3. Conditions of the Test:

a. Verify installation and perform startup of overhead coiling grilles in accordance with manufacturer’s written installation and startup procedures.

b. Manufacturer-approved personnel shall start-up units in accordance with manufacturer’s written procedures. Record results on manufacturer’s approved forms.

4. Acceptable Results:

a. Documented acceptable installation and startup in accordance with overhead coiling grilles manufacturer's written installation and startup procedures.

B. 0808-SU-02: Door Hardware:

1. System/Equipment to be Tested:

a. Door Hardware, in accordance with requirements as stated in the Contract Documents.

2. Functions to be Tested:

a. Adjusting, cleaning and demonstrating door hardware.

3. Conditions of the Test:

a. Verify installation and perform adjustment and cleaning in accordance with manufacturer's written installation and startup procedures.

b. An experienced hardware installer shall start-up units per manufacturer's written procedures. Record results on manufacturers approved forms.

c. Adjust door control devices to compensate for final operation of heating and ventilating equipment under normal and emergency operating conditions.

d. Verify the fail-safe or fail secure operation of the hardware for each side of the opening.

4. Acceptable Results:

a. Documented acceptable installation and startup in accordance with door hardware manufacturer's written installation and startup procedures.

b. Documented acceptable operation under normal and emergency operating conditions in accordance with Contract Documents and requirements of authority having jurisdiction.

3.06 LEVEL 1 SYSTEM TESTING REQUIREMENTS

A. 0808-S-01: Overhead Coiling Grilles and Doors or Vertical Lift Doors:

1. System/Equipment to be Tested:

a. Overhead coiling grilles in accordance with overhead coiling grilles as stated in the Contract Documents.

2. Functions to be Tested:

a. Opening and closing of units in manual (simulated power outage) and automatic operation.

b. Unit edge safety function.

c. [Egress functions.]

[Designer: If grille/door is provided with emergency button to override controls and open, include validation of emergency button.]

3. Conditions of the Test:

a. Begin the test with the unit closed.

b. Use the unit control system to fully open the grille.

c. Use the unit control system to partially close the grille.

d. Use the unit control system to fully close the grille.

e. Disconnect power from the unit operator. Manually open and close the unit.

f. Restore power to the unit operator. Use the unit control system to partially open the unit.

g. Place an obstruction in the path of the closing unit. Use the grille control system to attempt to fully close the unit.

h. Remove the obstruction from the path of the closing unit. Use the grille or door control system to attempt to fully close the unit.

i. [Where fire alarm and egress functions are provided, initiate a signal for the fire alarm or actuate the egress hardware to attempt to allow passage through the opening under those conditio*ns.]*

j. *[Designer: Confirm fire alarm operation and emergency response with ST and modify Conditions to reflect intended functionality.]*

4. Acceptable Results:

a. Unit fits securely and evenly against the jamb and against the floor without gaps.

b. Unit opens fully, moving smoothly and quietly without abnormal vibration.

c. Unit closes to the partial position desired, moving smoothly and quietly without abnormal vibration. Unit stays in the partially closed position until commanded otherwise.

d. Unit closes fully, moving smoothly and quietly without abnormal vibration.

e. Unit operates with moderate effort by one person.

f. Unit opens to the partial position desired, moving smoothly and quietly without abnormal vibration. Unit stays in the partially open position until commanded otherwise.

g. When the unit encounters the obstruction, the unit stops and reverses direction immediately.

h. Unit closes fully, moving smoothly and quietly without abnormal vibration.

i. [Unit opens/releases, as required per fire alarm interface input signal or egress requirements.]

j. *Designer: Confirm fire alarm operation and emergency response with ST and modify Conditions to reflect intended functionality.]*

B. 0808-S-02: Door Closing and Latching:

1. System/Equipment to be Tested:

a. Door and gate locking devices in accordance with requirements as stated in the Contract Documents.

b. Door closers in accordance with requirements as stated in the Contract Documents.

2. Functions to be Tested:

   a. Backcheck

   b. Closing

   c. Latching

   d. Latch release

3. Conditions of the Test:

   a. For each condition below, perform the following:

      1) Open door or gate the full range of travel, moving the door as quickly and forcefully as possible by a strong person.

      2) Open door or gate and release to close unassisted. Open to 45 degrees, 70 degrees and full open. Measure the time to close from 90 degrees to 12 degrees from latching.

4. Acceptable Results:

   a. Under all conditions, backcheck feature of closer prevents the door from impacting the stop with excess force.

   b. Under all conditions, door or gate closes from 90 degrees open to 12 degrees from full closed in not less than 5 seconds.

   c. Under all conditions, door closes and latches securely without excessive impact to door frame or mullion.

C. 0808-S-03: Door Operating Force:

1. System/Equipment to be Tested:

   a. Accessible path and public facing doors and gates in accordance with requirements as stated in the Contract Documents.

2. Functions to be Tested:

   a. Door or gate operating force.

3. Conditions of the Test:

   a. Normal ventilation operation: Open door or gate from push side while measuring door operating force.

   b. Normal ventilation operation: Open door or gate from pull side while measuring door operating force.

4. Acceptable Results:

   a. Under normal conditions, interior door operating force complies with provisions of the Americans with Disabilities Act that require a maximum door opening force, as measured directly above the lock, of 5 pounds.

   b. Under normal conditions, exterior and fire door operating force complies with provisions of the Americans with Disabilities Act that require a maximum door opening force, as measured directly above the lock, of 8.5 pounds.

c. Under all conditions, Closure from 70 degrees open to a point 3 inches from the latch shall take at least 3 seconds.

3.07 LEVEL 2 INTRA-STATION SYSTEM INTERFACE TESTS

A. 0808-IS-01: Interfaces of Overhead Coiling Grilles and Doors or Vertical Lift Doors:

1. System/Equipment to be Tested:

a. Interfacing status and control of overhead coiling grilles in accordance with overhead coiling grilles as stated in the Contract Documents.

2. Functions to be Tested:

a. Remote permissive control and opening and closing of units from interfacing system:

1) Access Control System (ACS).

2) Building Management System (BMS).

3) [Fire Alarm Response].

4) [*Designer: Confirm fire alarm operation and emergency response with ST and modify Conditions to reflect intended functionality].*

3. Conditions of the Test:

a. Begin the test with the unit closed.

b. Swipe a valid access card and use the unit control system to fully open the grille.

c. Swipe a valid access card and use the unit control system to partially close the grille.

d. Swipe a valid access card and use the unit control system to fully close the grille.

e. Use the BMS and command to fully open the grille.

f. Use the BMS to partially close the grille.

g. Use the BMSE to fully close the grille.

h. [Where fire alarm and egress functions are provided, initiate a signal for the fire alarm or actuate the egress hardware to attempt to allow passage through the opening under those conditio*ns.]*

i. *[Designer: Confirm fire alarm operation and emergency response with ST and modify Conditions to reflect intended functionality.]*

4. Acceptable Results:

a. Unit opens fully, moving smoothly and quietly without abnormal vibration.

b. Unit closes to the partial position desired, moving smoothly and quietly without abnormal vibration. Unit stays in the partially closed position until commanded otherwise.

c. Unit closes fully, moving smoothly and quietly without abnormal vibration.

d. [Unit opens/releases, as required per fire alarm interface input signal or egress requirements.]

e. *Designer: Confirm fire alarm operation and emergency response with ST and modify Conditions to reflect intended functionality.]*

B. [0808-IS-02: Stairwell and Smoke Control Door Operating Force [*Designer: Due to Pressure Difference, remove for non-tunnel stations or segments without tunnels*]:]

1. [System/Equipment to be Tested:]

a. [Doors in accordance with requirements as stated in the Contract Documents.]:

1) Stair access doors.

2) Stair discharge doors.

3) Smoke control separation doors.

4) Tunnel cross passage doors.

5) [Designer: Shall evaluate doors subject to pressure differential that results from emergency ventilation or pressurization and adjust list accordingly.]

2. [Functions to be Tested:]

a. [Door operating force.]

3. [Conditions of the Test:]

a. [Emergency ventilation and/or stairwell pressurization operation: Open door or gate from push side while measuring door operating force.]

b. [Emergency ventilation operation: Open door or gate from pull side while measuring door operating force.]

4. [Acceptable Results:]

a. [Under emergency conditions, exterior and fire door operating force measures a maximum door opening force, as measured directly above the opening device (handle, push bar, etc.) of 15 pounds to release latch and 30 pounds to start swing of door.]

b. [[Under emergency conditions, tunnel cross passage door operating force measures a maximum door opening force, as measured directly above the opening device (handle, push bar, etc.) of 25 pounds to release latch and 50 pounds to start swing of door.

C. 0808-IS-03: Sequence of Operation [Security Group A]

1. System/Equipment to be Tested:

a. Door Hardware [associated with Security Group A] in accordance with requirements as stated in the Contract Documents.[*Designer: to identify specific hardware sets from Section 08 71 00 – Door Hardware associated with Security Group A or ensure that Hardware Sets specified can be clearly identified with Security Groups identified in Table 801-4 of STDRM].*

b. Security monitoring system interface.

2. Functions to be Tested:

a. Sequence of operation as follows:

1) Normally locked on pull side.

2) Free egress at all times from push side. [*Designer: Test can be used for panic hardware or latch].*

3) Door position switch (DPS) signals security system when either leaf is open.

4) Card reader momentarily unlocks electronic mortise exit device (active leaf) and shunts DPS signal.

5) Request to exit (REX) switch in electronic mortise exit device push rail (both leaves) momentarily shunts DPS signal.

3. Conditions of the Test:

a. Prerequisites: Door hardware installed and fully operational. Security system interface installed and fully operational.

b. Attempt to open door from secure side.

c. Use invalid card to attempt to exit from secure side.

d. Use valid card to exit from secure side.

e. Activate push rail or latch in each leaf exit device. [*Designer: Test can serve single or bi-parting doors].*

f. Allow door to close without latching, then open door.

g. Repeat steps c. and d. while fire alarm system is in alarm.

4. Acceptable Results:

a. Prerequisites complete.

b. Pull side normally locked.

c. Invalid card read does not unlock door.

d. Valid card read unlocks secure side active leaf exit device and shunts door position signal.

e. Activation of request to exit switch in either leaf exit device push rail shunts door position signal.

f. Door alarm annunciated at security monitoring system.

g. Push side free egress under all conditions.

D. 0808-IS-04: Sequence of Operation [Security Group B]

1. System/Equipment to be Tested:

a. Door Hardware [associated with Security Group B] in accordance with requirements as stated in the Contract Documents.[*Designer: to identify specific hardware sets from Section 08 71 00 – Door Hardware associated with Security Group B or ensure that Hardware Sets specified can be clearly identified with Security Groups identified in Table 801-4 of STDRM]*

b. Security monitoring system interface

2. Functions to be Tested:

a. Sequence of operation as follows:

1) Local alarmed exit device sounds when door is open from "push" side unless card reader is used to momentarily shunt alarm.

2) Lever trim on "pull" side momentarily shunts alarm and retracts alarmed exit device latchbolt.

3) Door position switch (DPS) sends signal to security monitoring system when door is open.

3. Conditions of the Test:

a. Prerequisites: Door hardware installed and fully operational. Security system interface installed and fully operational.

b. Attempt to open door from push side without using valid access card.

c. Use valid access card to exit from push side.

d. Use lever trim on pull side to open door.

e. Allow door to close without latching, then open door.

4. Acceptable Results:

a. Prerequisites complete.

b. Local alarmed device sounds when door is opened from push side without use of valid access card. DPS sends signal to security monitoring system.

c. Valid access card read momentarily shunts local audible alarm. DPS sends signal to security monitoring system.

d. Activation of lever trim shunts door position signal and retracts local alarmed exit device latchbolt. DPS sends signal to security monitoring system.

e. Door alarm annunciated at security monitoring system.

f. Push side free egress under all conditions.

E. 0808-IS-05: Sequence of Operation [Security Group C]

1. System/Equipment to be Tested:

a. Gate hardware [associated with Security Group C] in accordance with requirements as stated in the Contract Documents.[*Designer: to identify specific hardware sets from Section 08 71 00 – Door Hardware associated with Security Group C or ensure that Hardware Sets specified can be* *clearly identified with Security Groups identified in Table 801-4 of STDRM].*

b. Security monitoring system interface.

2. Functions to be Tested:

a. Sequence of operation as follows:

1) Free egress at all times from either side.

2) Gate position switch (DPS) signals security system when gate is open.

3) Card reader momentarily shunts DPS signal.

3. Conditions of the Test:

a. Attempt to open gate from non-public side without use of valid access card.

b. Attempt to open gate from non-public side by using valid access card. DPS signals security system when door is open.

c. Attempt to open gate from public side without use of valid access card. DPS signals security system when gate is open.

d. Attempt to open gate from public side using an invalid card.

e. Attempt to open gate from public side by using valid access card. DPS signals security system when gate is open.

4. Acceptable Results:

a. Use of paddle handle opens gate.

b. Door alarm annunciated at security monitoring system.

c. Card reader shunts DPS signal.

d. Acceptable results same as a. through d.

F. 0808-IS-06: Sequence of Operation [Security Group D]:

1. System/Equipment to be Tested:

a. Door Hardware [associated with Security Group D] in accordance with requirements as stated in the Contract Documents.[*Designer: to identify specific hardware sets from Section 08 71 00 – Door Hardware associated with Security Group D or ensure that Hardware Sets specified can be clearly identified with Security Groups identified in Table 801-4 of STDRM].*

b. Security monitoring system interface

2. Functions to be Tested:

a. Sequence of operation as follows:

1) Door position switch (DPS) sends signal to security monitoring system when door is open.

2) Conditions of the Test:

3) Open and close door with system in normal mode.

3. Acceptable Results:

a. Security monitoring system shows correct door position under all conditions.

G. [0808-IS-06: Sequence of Operation [Security Group E]]:

1. System/Equipment to be Tested:

a. Door Hardware [associated with Security Group E] in accordance with requirements as stated in the Contract Documents. [*Designer: to remove if cross passages are not part of contract. If part of contract identify specific hardware sets from Section 08 71 00 – Door Hardware associated with Security Group E or ensure that Hardware Sets specified can be clearly identified with Security Groups identified in Table 801-4 of STDRM].*

b. Security monitoring system interface.

2. Functions to be Tested:

a. Sequence of operation as follows:

1) Door position switch (DPS) sends signal to security monitoring system when door is open.

2) Local visible strobe is activated.

3) Visible strobe is deactivated.

3. Conditions of the Test:

a. Open and close door with system in normal mode.

4. Acceptable Results:

a. Security monitoring system shows correct door position under all conditions:

1) Local visible strobe is activated for time specified in contract documents. If not indicated, confirm with ST Operations and LRV operator training.

2) Visible strobe shuts off after set time of door closed and DPS contact.

H. [0808-IS-07: Sequence of Operation [Security Group L]]

1. System/Equipment to be Tested:

a. Door Hardware [associated with Security Group L] in accordance with requirements as stated in the Contract Documents. [*Designer: Remove if facility does not have public Restrooms. Designer to identify specific hardware sets from Section 08 71 00 – Door Hardware associated with Security Group L or ensure that Hardware Sets specified can be clearly identified with Security Groups identified in Table 801-4 of STDRM. Coordinate with CCTV and Access Control design*].

b. Security monitoring system interface.

2. Functions to be Tested:

a. Sequence of operation as follows:

1) Normally locked on pull side with electronic lock device.

2) Free egress at all times from push side.

3) Door position switch (DPS) signals security system when either door is open.

4) Occupancy Sensor indicates occupant and controls lighting and fan.

5) Deadbolt provides local and remote visual indication of occupancy.

6) Card reader momentarily unlocks electronic lock device.

7) Video request phone is used for requesting access.

8) Remote unlock is provided by Security Operations Center (SOC) and Access Control System.

3. Conditions of the Test:

a. Prerequisites: Door hardware installed and fully operational. Security system interface installed and fully operational.

b. Attempt to open door from secure side.

c. Use invalid card to attempt to exit from secure side.

d. Use valid card to exit from secure side.

e. Confirm occupancy, activate deadbolt, de-activate deadbolt and activate latch exit device.

f. Utilize video request phone to request access.

4. Acceptable Results:

a. Prerequisites complete.

b. Pull side normally locked.

c. Invalid card read does not unlock door.

d. Valid card read unlocks secure side.

e. Occupancy sensor activates light and fan. Deadbolt activation is reported to Access Control System and visual indication of Occupied is provided on exterior. De-activation of deadbolt and latch allow exit.

f. Video Request phone allows SOC to view requester and remotely unlock door.

I. [0808-IS-0X: Sequence of Operation [identify hardware group from Section 08 71 00 – Door Hardware or security group from Security Group A in Table 801-4 not included above and develop sequence and testing parameters]:

1. System/Equipment to be Tested:

a. Door Hardware Sets [Designer identified] in accordance with requirements as stated in the Contract Documents.

b. Security monitoring system interface.

2. Functions to be Tested:

a. Sequence of operation as follows:

1) [Designer to develop sequence of operations].

3. Conditions of the Test:

a. [Designer to develop conditions of the test].

4. Acceptable Results:

a. [Designer to develop Acceptable Results].

3.08 LEVEL 3 INTER-STATION SYSTEM INTERFACE TEST REQUIREMENTS

A. Support Level 3 testing to ensure the correct exchange of signals between the equipment supplied by others and integration with existing head end systems, including:

1. The BMS software and TCN network at LCC, and the Access Control System equipment provided for the Stations under this Contract.

2. The software and network at SOC, and the Access Control System equipment provided for the Stations and Parking Garages under this Contract.

B. Level 3 Test Support: During the Level 3 testing period, must be coordinated with Sound Transit, and the team of Transit Systems within Operations. Provide adequate personnel to adjust equipment and troubleshoot system failures that might arise. Support Level 3 tests with the assistance from Contractor, Construction Management, External Systems Contractors, Operations, and the final design consultant. Systems will be tested together during Level 3 Testing to ensure proper functionality, inter-operability, and reliability of systems necessary for operation.

C. Provide copies of all settings and terminal wiring to Sound Transit – Transit Systems and the [Access Control Systems contractor] to confirm and validate the interface to SOC.

D. When a piece of Contractor provided equipment is found to be in conflict with specific criteria, have an experienced representative of the manufacturer make an adjustment to the item. If adjustments fail to correct the operation of a piece of equipment or fixture, remove the equipment or fixture from the Contract site and replace it with a workable replacement that will meet the specification requirements.]

SEQUENCE OF OPERATION TEST CHECKLIST

	Date:											
	Pass? Yes:	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐
	No:	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐
No.	Checklist Item:	592L104A	Door ID#									
1.1	<u>Attempt to Open from Secure Side without Key or Access Card</u>: Normally locked on pull side. Start with door leafs both closed and attempt to open the door (active leaf) from the secure side. Verify: • Both door leafs door remains closed and locked. • Access control system indicates both leafs closed.											
1.2	<u>Open Active Leaf with a Key from Secure Side</u>: Verify: • Door deadbolt can be unlocked via the key lock cylinder on the active leaf, allowing the secure side door handle to operate and the user to open the active leaf. • The backstop device limits the maximum open position of the active leaf correctly. • The inactive leaf remains closed when the active leaf is initially opened, being kept close by the top retractable rods on the inactive leaf. • Access control system indicates that the active leaf is open when it is not in the closed position.											

1.3	<u>Open Inactive Leaf from Secure Side:</u> Verify: • When the active leaf is initially open, the bottom retractable rod unlatches automatically but the top retractable rod remains engaged, keeping the active leaf closed. • A button on the top retractable rod hardware allows the operator to unlatch the top rod and open the inactive leaf. • The Overhead stop device limits the maximum open position of the inactive leaf correctly. • Access control system indicates that the inactive leaf is open when it is not in the closed position.											
1.4	<u>Open the Active Leaf from the Non-Secure Side</u>: With both leafs closed, operate the door handle from the non-secure side of the active leaf. Verify: • The non secure side door handle operates and unlatches the mortise latch as well simultaneously retracts the deadbolt to allow the active leaf to open and allow free passage through the active leaf. • The door closer on the active leaf automatically closes the active leaf and the door latches closed when passage is complete, and the active leaf is released. • The inactive leaf remains closed.											
1.5	<u>Attempt to Open from Secure Side with Invalid Access Card</u>: Verify: • The card reader reads the invalid access control card but does not unlock the electric locking mechanism. • The door cannot be opened.											
1.6	<u>Open the Active Leaf from the Secure Side with Valid Access Card</u>: Verify: • The card reader reads the valid access control card and temporarily unlocks the electric locking mechanism. • The active leaf can be opened. • When the active leaf is released, after opening, the door closer closes the door and the door latches on its strike.											

	• The access control automatically relocks the electric locking mechanism when the door is closed.

SECTION 08 11 13

HOLLOW METAL DOORS AND FRAMES

PART 1 - GENERAL.

1.01 SUMMARY

A. Section includes:

1. Requirements for the following:

a. Non-fire-rated steel doors and frames.

b. Fire-rated steel doors and frames.

c. Thermally insulated steel doors.

d. Acoustic-rated steel doors.

e. Steel doors with perforated metal infill panel.

f. Ballistic-rated steel doors.

g. Accessories, including glazing (see other section) and matching panels.

1.02 REFERENCES

A. This Section incorporates by reference the latest revision of the following documents:

1. American National Standards Institute (ANSI), International Code Council (ICC), Steel Door Institute (SDI):

a. ANSI/ICC A117.1 - American National Standard for Accessible and Usable Buildings and Facilities; International Code Council.

b. ANSI/BHMA A156.115 – Hardware Preparation In Steel Doors And Steel Frames.

c. ANSI/SDI A250.6 – Recommended Practice for Hardware Reinforcing on Standard Steel Doors and Frames.

d. ANSI A250.8 - SDI-100 Specifications for Standard Steel Doors and Frames.

e. ANSI A250.10 - Test Procedure and Acceptance Criteria for Prime Painted Steel Surfaces for Steel Doors and Frames.

2. American Society for Testing and Materials International (ASTM):

a. ASTM A153/A153M Standard for Zinc Coating (hot-Dip) on Iron and Steel Hardware.

b. ASTM A653/A653M - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.

c. ASTM A879/A879M Standard Specification for Steel Sheet, Zinc Coated by the Electrolytic Process for Applications Requiring Designation of the Coating mass on Each Surface.

d. ASTM A1008/A1008M Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, Required Hardness, Solution Hardened, and Bake Hardenable.

e. ASTM A1011/A1011M Standard Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, and Ultra-High Strength.

f. ASTM C665 Standard Specification for Mineral-Fiber Blanket Thermal Insulation for Light Frame Construction and Manufactured Housing

g. ASTM C1363 - Standard Test Method for Thermal Performance of Building Materials and Envelope Assemblies by Means of a Hot Box Apparatus

h. ASTM E136 Standard Test Method for Assessing Combustibility of Materials Using a Vertical Tube Furnace at 750 degrees Celsius.

3. Door and Hardware Institute (DHI):

a. DHI A115 Series - Specifications for Steel Doors and Frame Preparation for Hardware; Door and Hardware Institute (ANSI/DHI A115 Series).

4. The National Association of Architectural Metal Manufacturers (NAAMM):

a. NAAMM HMMA 840 - Guide Specification for Installation and Storage of Hollow Metal Doors and Frames.

5. National Fire Protection Association (NFPA):

a. NFPA 80 - Standard for Fire Doors and Other Opening Protectives.

6. Underwriters Laboratories Inc. (UL):

a. UL 10C – Standard for Positive Pressure Fire Tests of Door Assemblies.

b. UL 752 Bullet Protection Ratings.

c. UL 1784 - Standard for Air Leakage Tests of Door Assemblies and Other Opening Protectives.

1.03 SUBMITTALS

A. Submit:

1. Product Data: Materials and details of design and construction, hardware locations, reinforcement type and locations, anchorage and fastening methods, and finishes; and one copy of referenced grade standard.

2. LEED Submittals:

a. Where LEED certification is required by the project, submit the same documentation for approval as required by GBCI as a project submittal. Highlight the relevant LEED information.

b. LEED documentation is to be submitted separately and titled LEED SUBMITTAL.

c. Building Product Disclosure and Optimization credit data: Submit data to support the LEED SUBMITTAL.

3. Shop Drawings: Details of each opening, showing elevations, glazing, frame profiles, and identifying location of different finishes, if any. Include installation details for each condition.

B. Transmit:

1. Installation Instructions: Manufacturer's published instructions, including all special installation instructions relating to this project.

2. Manufacturer's Qualification:

a. Provide evidence of having personnel and plant equipment capable of fabricating hollow metal door and frame product of the types specified.

1.04 QUALITY ASSURANCE

A. Manufacturer: Company specializing in manufacturing the products specified in this Section with minimum 3 years documented experience.

B. Single Source: Obtain hollow metal doors and frames from a single manufacturer.

C. Maintain at the project site a copy of all reference standards dealing with installation.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Store in accordance with NAAMM HMMA 840.

B. Clearly identify and mark each door and frame to correspond with same number as listed on the schedule submitted with shop drawings.

C. Protect with resilient packaging; avoid humidity build-up under coverings; prevent corrosion.

D. Inspect hollow metal work upon delivery for damage. Minor damages may be repaired provided refinished items are equal in all respects to new work. Remove and replace damaged items as directed by Resident Engineer.

PART 2 - PRODUCTS

2.01 MATERIALS

A. Doors and Frames:

1. Requirements for All Doors and Frames:

a. Accessibility: Comply with ANSI/ICC A117.1.

b. Door Top Closures: Flush with top of faces and edges.

c. Door Edge Profile: Beveled on both edges.

d. Door Texture: Smooth faces.

e. Infill panels: Non-removable stops on non-secure side.

f. Hardware Preparation: In accordance with DHI A115 Series, with reinforcement from same material as doors and frames welded in place, in addition to other requirements specified in door grade standard.

g. Finish: Galvanized, unless noted otherwise in door schedule: All components hot-dip zinc-iron alloy-coated (galvannealed), ASTM A653/A635M, A40 coating thickness or baked –on primed paint, for field finishing.

h. Glazed Panels: Provide non-removable stops on the non-secured side.

i. Fabricate concealed stiffeners and hardware reinforcement from either cold- or hot-rolled steel sheet.

2. Combined Requirements: If a particular door and frame unit is indicated to comply with more than one type of requirement, comply with all the specified requirements for each type; for instance, an exterior door that is also indicated as being sound-rated shall comply with the requirements specified for exterior doors and for sound-rated doors; where two requirements conflict, comply with the most stringent.

3. Doors and Frames: Label in accordance with code requirements.

B. Steel Doors:

1. Exterior Doors:

a. Grade: Maximum-Duty Doors and Frames ANSI A250.4 Level 4, physical performance Level A, Model 2, seamless galvanizing: All components hot-dipped zinc-iron alloy-coated (galvannealed) in accordance with ASTM A653/A653M, coating thickness: A60.

2. Thermal-Rated (Insulated) Doors: For exterior doors enclosing conditioned space provide doors fabricated with coefficient of thermal transmission (U-Factor) to meet energy code requirements when tested according to ASTM C1363 as listed in Issued for Construction Drawings.

3. Acoustic-Rated Doors: Manufacturer's standard construction to meet acoustic requirements indicated on the Issued for Construction Drawings, minimum STC 33, complying with ANSI/SDI 128:

a. Grade: ANSI A250.8 Level 2, Physical performance Level B, Model 1, full flush.

4. Interior Doors, Non-Fire-Rated:

a. Grade: ANSI A250.8 Level 2, physical performance Level B, Model 1, full flush.

5. Interior Doors, Fire-Rated:

a. Grade: ANSI A250.8 Level 2, physical performance Level B, Model 1, full flush.

b. Fire Rating: As indicated on Door and Frame Schedule, complying with NFPA 80 and tested in accordance with UL 10C and NFPA 252 ("positive pressure tests").

1) Temperature Rise Ratings (TRR): In accordance with local building code and authorities having jurisdiction.

2) Provide units listed and labeled by UL.

3) Attach fire rating label to each fire rated unit.

c. Smoke and Draft Control Doors (Pressure Resistant Doors) (Indicated as "S" in Door Schedule): In addition to required fire rating, provide door assemblies tested in accordance with UL 1784 with maximum air leakage of 3.0 cubic feet per minute per square foot of door opening at 0.10-inch water gage pressure at both ambient and elevated temperatures; with "S" label; if necessary, provide additional gasketing or edge sealing:

1) Grade: ANSI A250.8 Level 3, physical performance Level A, Model 1, full flush.

2) Door hardware to conform to door assembly design pressure loads.

3) Fire rated assembly tested to UL 10C.

d. Steel Bullet Resistant Doors and frames:

1) Product: Subject to compliance with requirements, provide the following or approved equal:

a) Basis of Design: Ceco ArmorShield flush door and frame system rated UL 752 Level 3 or greater.

2) Certified and third-party tested in accordance with UL 752 and NIJ standards.

3) Seamless door edge.

4) Minimum Door 12-gauge steel door faces with ballistic core and 14-gauge frame.

5) Hinges; Stainless steel continuous pin and barrel with stainless steel bearings

6) Panels: Same construction, performance, and finish as doors. Doors with infill panels shall be constructed as tubular stile and rail construction with formed integral stops on the non-secure side. Provide glazing spacers as required to accommodate infill panels indicated on contract documents.

7) Fire rated assembly tested to UL 10C.

C. Steel Frames:

1. General:

a. Comply with the requirements of grade specified for corresponding door.

b. Finish: Same as for door where doors are not factory-finished.

c. Provide mortar guard boxes for hardware cut-outs in frames to be installed in masonry.

d. Frames in Masonry Walls: Size to suit masonry coursing with head member 4 inches high to fill opening without cutting masonry units.

e. Frames wider than 48 Inches: Reinforce with steel channel fitted tightly into frame head, flush with top.

2. Exterior Door Frames: Face welded, seamless with joints filled:

a. Frame Construction: Fully welded, thermally broken, constructed of hot-dip zinc-iron alloy-coated (galvannealed) steel in conformance with ASTM A-653, A60 coating designation.

b. Weatherstripping/thresholds: Separate, see Section 08 71 00 - Door Hardware.

c. Material Thickness: minimum 14-gauge.

d. Insulation: Fully-filled frame cavity, manufacturer’s standard insulation.

e. Construction: Full profile welded.

3. Interior Door Frames, Non-Fire-Rated: Fully welded type:

a. Finish: Factory primed, for field finishing.

4. Interior Door Frames, Fire-Rated: Fully welded type.

a. Fire Rating: Same as door, labeled.

2.02 FRAME ANCHORS

A. Jamb Anchors:

1. Masonry Type: Adjustable strap-and-stirrup or T-shaped anchors to suit frame size, not less than 0.042-inch thick, with corrugated or perforated straps not less than 2-inches wide by 10- inches long; or wire anchors not less than 0.177-inch thick.

2. Stud Wall Type: Designed to engage stud, welded to back of frames; not less than 0.042- inch thick.

3. Quantity: Minimum of three anchors per jamb, with one additional anchor for frames with no floor anchor. Provide one additional anchor for each 24 inches of frame height above 7 feet.

4. Post-Installed Expansion Anchor: Minimum 3/8-inch diameter bolts with expansion shields or inserts, with manufacturer's standard pipe spacer.

B. Floor Anchors: Provide floor anchors for each jamb and mullion that extends to floor:

1. Monolithic Concrete Slabs: Clip-type anchors, with two holes to receive fasteners.

2. Separate Topping Concrete Slabs: Adjustable-type anchors with extension clips, allowing not less than 2-inch height adjustment. Terminate bottom of frames at finish floor surface.

C. Retain "Floor Anchors for Concrete Slabs with Underlayment" Paragraph below when using flowable underlayment over slabs or floor structure.

D. Floor Anchors for Concrete Slabs with Underlayment: Adjustable-type anchors with extension clips, allowing not less than 2-inch height adjustment. Terminate bottom of frames at top of underlayment.

E. Material: ASTM A879/A879M, Commercial Steel (CS), 04Z (12G) coating designation; mill phosphatized.

F. For anchors built into exterior walls, steel sheet complying with ASTM A1008/A1008M or ASTM A 1011/A1011M; hot-dip galvanized according to ASTM A153/A153M, Class B.

2.03 ACCESSORIES

A. Temporary Frame Spreaders: Provide for all factory- or shop-assembled frames.

B. Inserts, Bolts, and Fasteners for accessories: Hot-dip galvanized according to ASTM A 153/A153M.

C. Power-Actuated Fasteners in Concrete: Fastener system of type suitable for application indicated, fabricated from corrosion-resistant materials, with clips or other accessory devices for attaching hollow-metal frames of type indicated.

D. Mineral-Fiber Insulation: ASTM C665, Type I (blankets without membrane facing); consisting of fibers manufactured from slag or rock wool; with maximum flame-spread and smoke-developed indexes of 25 and 50, respectively; passing ASTM E136 for combustion characteristics.

E. Louvers:

1. Provide louvers for interior doors, where indicated, which comply with SDI 111, with blades or baffles formed of 0.020-inch- (0.5-mm-) thick, cold-rolled steel sheet set into 0.032-inch-(0.8-mm-) thick steel frame:

a. Sight-proof Louvers: Stationary louvers constructed with inverted-V or inverted-Y blades.

b. Form corners of moldings with hairline joints. Provide fixed frame moldings on outside of exterior and on secure side of interior doors and frames.

c. When specified, fire doors shall be provided with fire labeled louvers in accordance with applicable building codes and SDI-118.

2.04 FABRICATION

A. Fabricate hollow metal work to be rigid, without warp, or buckle. Accurately form metal to required sizes and profiles, with minimum radius for thickness of metal.

B. Tolerances: Fabricate hollow metal work to tolerances indicated in SDI 117.

C. Glazed Lites: Provide stops and moldings around glazed lites where indicated. Form corners of stops and moldings with mitered hairline joints.

1. Provide integral frame moldings on outside of exterior and on secure side of interior doors and frames.

2. Coordinate rabbet width between fixed and removable stops with type of glazing and type of installation indicated.

3. Provide insulated glazing at all exterior door vision lites:

a. Refer to Section 08 80 00 - Glazing, insulated glazing units.

D. Hollow-Metal Frames: Fabricate in one piece except where handling and shipping limitations require multiple sections. Where frames are fabricated in sections, provide alignment plates or angles at each joint, fabricated of metal of same or greater thickness as frames.

E. Hollow Metal Doors:

1. Exterior Doors: Provide weep-hole openings in bottom of exterior doors to permit moisture to escape. Seal joints in top edges of doors against water penetration.

2. Astragals: Provide overlapping astragal on one leaf of pairs of doors where required by NFPA 80 for fire-performance rating or where indicated. Extend minimum 3/4 inch beyond edge of door on which astragal is mounted or as required to comply with published listing of qualified agency.

F. Hardware Preparation: Factory prepare hollow-metal doors and frames to receive templated mortised hardware, and electrical wiring; include cutouts, reinforcement, mortising, drilling, and tapping according to SDI A250.6, the Door Hardware Schedule, and templates:

1. Locate hardware as indicated, or if not indicated, according to ANSI/SDI A250.8.

2. Reinforce doors and frames to receive non-templated, mortised and surface-mounted door hardware.

3. Comply with applicable requirements in ANSI/SDI A250.6 and ANSI/DHI A115 Series specifications for preparation of hollow metal work for hardware.

4. Coordinate locations of conduit and wiring boxes for electrical connections with Division 26 Sections.

5. Provide the manufacturer’s heavy duty high frequency hinge reinforcing system at all hinge locations.

G. Comply with BHMA A156.115 for preparing hollow-metal doors and frames for hardware.

2.05 FINISHES

A. Doors and frames to be finished with a high-performance industrial coating as defined in Specification Section 09 96 00 - High- Performance Coatings.

B. Primer: Rust-inhibiting, complying with ANSI A250.10, factory applied, door manufacturer’s standard and compatible with substrate and field-applied finish coatings

1. Siliconized primers are not permitted.

C. Corrosion Resistant Undercoating:

1. Asphaltic adhesive undercoating approved by hollow metal door manufacturer.

2. Approved for use with UL fire-rated door frames.

3. Water-based.

4. Moisture resistant.

5. Quick drying.

6. Free of Volatile Organic Compounds.

2.06 PREPARATION FOR ELECTRONIC HARDWARE SYSTEMS

A. Prepare all doors required for the application of electronic locks, remote monitoring, door position switches, etc. which require the door to have wires through the door shall be provided pre-wired with a factory installed quick connect. The use of non-wired conduit in the door, or exposed wiring on the door or frame surface, is not acceptable.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Verify existing conditions before starting work.

B. Verify that opening sizes and tolerances are acceptable.

3.02 PREPARATION

A. Coat inside of frames installed in concrete or masonry walls with manufacturer-approved corrosion-resistant undercoating.

3.03 INSTALLATION

A. Install in accordance with the requirements of the specified door grade standard and NAAMM HMMA 840 in accordance with manufacturer's instructions based on conditions present.

B. Set frames accurately in position, plumbed, aligned, and braced securely until permanent anchors are set. After wall construction is complete, remove temporary braces, leaving surfaces smooth and undamaged.

1. Install in accordance with the requirements of the specified door grade standard and NAAMM HMMA 840..

2. Install fire-rated units in accordance with NFPA 80.

3. Check plumbness, squareness, and twist of frames as walls are constructed. Shim as necessary to comply with installation tolerances.

C. Erection Tolerances:

1. Clearances between Door and Frame: As specified in ANSI A250.8.

2. Maximum Diagonal Distortion: 1/16-inch measured with straight edge, corner to corner.

D. Coordinate frame anchor placement with wall construction.

E. Install louvers where shown, with tamper proof screws.

F. Install perforated metal infill panels into opening with non-removable stops on non-secure side of door.

G. Install glazed panels where shown, with tamper proof screws.

H. Grouting Door Frames: Do not grout frames.

I. Fill door frames between conditioned and non-condition spaces with mineral fiber insulation prior to installation.

J. Coordinate installation of hardware.

K. Coordinate installation of electrical connections to electrical hardware items.

L. Field Touch-Up Painting: Touch-up doors and frames including the refinishing of raw surfaces resulting from job fitting, repair of job inflicted scratches and or marred surfaces.

3.04 ADJUSTING

A. Adjust for smooth and balanced door movement in accordance with manufacturer's instructions.

B. Adjust and lubricate hardware for proper operation.

3.05 COMMISSIONING

A. Commission doors in accordance with Section 01 91 13 - General Commissioning Requirements, Section 07 08 00 - Commissioning of Building Enclosure and Section 08 08 00 - Commissioning of Openings.

B. Coordinate with Commissioning (Cx) Authority, Building Envelope Commissioning (BECxA) Authority and Contractor's Commissioning Coordinator.

3.06 PROTECTION

A. Protect installed work as required by the manufacturer to maintain product performance, design criteria and warranty.

3.07 SCHEDULES

A. Refer to Door and Frame Schedule on the Issued for Construction Drawings.

END OF SECTION

SECTION 08 31 00

ACCESS DOORS AND PANELS

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for the following:

a. Access door and frame units, fire-rated and non-rated, in wall, ceiling, and floor locations.

b. Access panel and frame units.

c. Flush-mounted Electrical and Communication Door with Concealed Frame.

d. Access doors indicated in the Contract Documents, or otherwise required to access concealed construction requiring regular maintenance or repair.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. American Society for Testing and Materials International (ASTM):

a. ASTM A666 - Standard Specification for Annealed or Cold-Worked Austenitic Stainless-Steel Sheet, Strip, Plate, and Flat Bar.

b. ASTM A879/A879M - Standard Specification for Steel Sheet, Zinc Coated by the Electrolytic Process for Applications Requiring Designation of the Coating Mass on Each Surface.

c. ASTM A1008/A1008M - Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, Solution Hardened, and Bake Hardenable.

d. ASTM B209 - Standard Specification for Aluminum and Aluminum-Alloy Sheet and Plate.

e. ASTM B221 - Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes.

2. National Fire Protection Association (NFPA):

a. NFPA 80 - Standard for Fire Doors and Other Opening Protectives.

b. NFPA 252 - Standard Method of Fire Tests of Door Assemblies.

c. NFPA 288 - Standard Methods of Fire Tests of Horizontal Fire Door Assemblies Installed in Horizontal Fire Resistance-Rated Floor System.

1.03 COORDINATION

A. Coordinate the work with other work requiring access doors. Determine specific locations and sizes needed to gain access to concealed equipment and indicate in Project Record Documents.

1.04 SUBMITTALS

A. Product Data: Provide a schedule of access doors including sizes, types, finishes, hardware, locations, profiles, and details of adjoining work.

B. Shop Drawings:

1. Indicate exact position of each access door unit, details of frames, anchorage, and accessory items.

2. Provide detail drawings of the Access Doors and Frames and coordination with adjacent finish and partition types.
Provide plans, sections, and details for the Flush Mechanical and Communication Access doors.

C. Product Schedule: Provide complete access door schedule, including types, locations, sizes, latching or locking provisions, and other data pertinent to installation.

D. Closeout: Submit keys to the Resident Engineer.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. Design Requirements:

1. Fabricate floor access assemblies to support live load of 100 pounds per square foot with deflection not to exceed 1/180 of span.

B. Regulatory Requirements:

1. Conform to Authorities Having Jurisdiction (AHJ's) Building Code requirements for fire-rated access doors.

a. Provide access doors of fire-rating equivalent to the fire-rated assembly in which they are to be installed. Fire rated-door assemblies shall comply with NFPA 80.

2. Provide products listed and labeled by UL as suitable for the purpose specified and indicated. Test for vertical installations: NFPA 252 or UL 10B. Test for horizontal installations: NFPA 288.

2.02 MANUFACTURERS

A. Access Doors: Acceptable manufacturers include:

1. Acudor Products Inc.

2. The Williams Brothers Corporation of America.

3. Milcor Inc.

4. Nystrom Products Co.

2.03 MATERIALS

A. Steel Sheet: ASTM A1008/A1008 M commercial quality, cold-rolled steel sheet with baked-on, rust-inhibitive primer for interior doors.

B. Zinc-Coated Steel Sheet: ASTM A879/A879M, electrolytic zinc-coated steel sheet with Class C coating and phosphate treatment to prepare surface for painting for exterior doors.

C. Stainless-Steel Sheet, Strip, Plate, and Flat Bars: ASTM A666, Type 316 for exterior and Type 304 for interior. Remove tool and die marks and stretch lines or blend into finish.

D. Continuous Stainless-Steel Hinges-Station Ticketing Kiosk:

1. Hinges to be non-handed and of slim barrel design. Hinges to made of Type 316 stainless steel and shall have a concealed Teflon-coated stainless-steel pin with twin self-lubricated nylon bearings at each knuckle. Hinges shall be UL list up to and including three (3) hours and shall be available with power transfer cutouts when necessary.

2. Acceptable Manufacturers: Markar, McKinney, or approved equal.

3. Hinge size and configuration per contract documents.

E. Aluminum Extrusions: ASTM B221, Alloy 6063-T6.

1. Mill finish, AA-M10 (Mechanical Finish: as fabricated, unspecified).

F. Aluminum-Alloy Plate: ASTM B209, Alloy 6061-T6.

1. Mill finish, AA-M10 (Mechanical Finish: as fabricated, unspecified).

2. Non-slip finish: Bonded aluminum oxide grit or proprietary plasma-bonded metal matrix such as W.S. Molnar "Slip-Not" or IKG "Mebac" (Metal Bonded Anti-Slip Coating)

a. Static coefficient of friction not less than 0.80, wet condition.

2.04 MANUFACTURED UNITS

A. Access Doors and Panels:

1. General: Factory fabricated, fully assembled units with corner joints welded, filled, and ground flush; square and without rack or warp; coordinate requirements with assembly's units are to be installed in.

B. Access Door Units – Walls and Ceilings:

1. Door and Frame Units with Exposed Trim: Formed steel.

a. Doors: 16-gauge steel.

b. Frames and flanges:14-gauge steel.

c. Trim: 1-inch flange overlapping surfaces surrounding door frame

2. Trim-less Flush Frame Units:

a. Metal: 0.058-inch-thick steel.

b. Frame Configuration: Minimum 14-gauge steel flange integral with frame and overlapping face of adjoining gypsum board, with surface formed to receive joint compound.

c. Door panels: Minimum 16-gauge steel sheet.

d. Provide recessed door face where indicated to receive tile or brick veneer and setting bed infill.

1) Infill Reinforcement: Type and finish as required by setting bed manufacturer for application indicated. Weld or anchor mesh reinforcement to door panel when required by setting bed manufacturer for application indicated.

2) Coordinate infill depth with infill installer.

e. Sizes:

1) Walls and Ceilings: Provide access doors sized to accommodate clearances of equipment being accessed.

2) Personnel Entry: To comply with Washington L&I requirements.

3) `Lay-in' Grid Ceilings: To match grid module

3. Hardware:

a. Hinges: Fully-concealed, 175-degree continuous steel piano hinge.

b. Lock: Flush cylinder lock with latch, two keys for each unit.

c. Provide self-latching bolt, key operated, and self-closing mechanism for fire-rated access doors.

4. Fire Ratings: Match rating of the partition or floor/ceiling assembly in which the access panel is to be installed:

a. Galvanized, hot dipped finish.

5. Finish: Phosphate-treated with manufacturer's standard electrostatically-applied baked-enamel finish:

a. Prime coat with alkyd primer.

C. Access Units – Interior Floors:

1. Hatch and Frame Units: Formed steel.

a. Frames and anchors: 0.058 inch thick.

b. Type and Size: As indicated on Issued for Construction Drawings

c. Hardware:

1) Hinge: 175-degree steel hinges with removable pin.

2) Lock: Screw driver slot for quarter turn cam lock.

3) Removable wrench lift handle.

d. Galvanized, hot dipped finish.

e. Prime coat with alkyd primer.

D. Flush Mechanical and Communication Door with Concealed Frame:

1. Access Door Frame:

a. Frame Configuration: Frame recessed from face of door sufficient to allow overlapping face of adjoining metal panels.

b. Provide door frame sufficient to prevent racking and distortion of the door panel. Loads shall not be transferred to the metal door panel.

c. Size and configuration per contract documents.

2. Flush Access Door Panel:

a. Comply with load requirements specified for adjacent metal panels as stated elsewhere in the Contract Documents.

b. Exposed edges: Comply with adjacent metal panels.

c. Gap between Door Panel and Adjoining Metal Panels: Match adjacent panel system jointing system. Allow for swing action.

d. Include attachment system components, panel stiffeners, and accessories required for vandal-resistant application.

e. Fasteners: Per adjacent metal panel system; concealed.

3. Door Panel and Frame: See Contract Drawings for Size, configuration, and swing.

4. Hardware: Unless otherwise stated elsewhere in the Contract Documents, provide the following:

a. Hinges: Fully-concealed, 175-degree continuous piano hinge; Stainless Steel Type 316

b. Lock: Flush cylinder lock with latch, two keys for each unit; stainless steel. Key all locks alike. Cylinders and keying as stated elsewhere in the Contract Documents.

c. Locking Devices: To hold door in flush smooth plane when closed.

5. Finish: Match adjacent surface.

2.05 FABRICATION

A. Manufacture each access door assembly as an integral unit ready for installation.

B. Weld, fill, and grind joints to ensure flush and square unit. Construction should be continuous and welded. Grind welds smooth and flush with adjacent surfaces. Furnish attachment devices and fasteners of type required to secure access panels to types of supports indicated.

1. For exposed flange units, provide 1 inch (nominal) wide trim around perimeter of frame.

2. For gypsum board assemblies, furnish frames with edge trim for gypsum board or gypsum base.

3. For masonry installations, furnish frames with adjustable metal masonry anchors.

C. Recessed Panel Doors: Form face of panel to provide recess for application of applied finish. Reinforce panel as required to prevent buckling.

1. Furnish recessed panel doors for concealed installation in acoustic tile ceiling systems.

2. Furnish recessed panel doors and frames for concealed installation in gypsum wall board.

D. Locking Devices: Furnish as required to hold door in flush smooth plane when closed. Provide two (2) keys per lock and key locks alike. Provide access sleeves and plastic grommets installed in holes cut through finish for recessed panel doors.

E. Extruded Aluminum: After fabrication, apply manufacturer's standard protective coating on aluminum that will come in contact with concrete.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Verify that rough openings for door and frame are correctly sized and located to allow convenient access to the concealed work. Coordinate installation with mechanical, electrical, and plumbing. Do not place ceiling panels directly over equipment that would impede maintenance access.

B. Advise Installers of other work about specific access door installation requirements, including sizes of openings, locations of supports, inserts, and anchoring devices. Furnish inserts and anchoring devices for access doors that must be built into other construction. Coordinate delivery with other work to avoid delay.

3.02 INSTALLATION

A. Install units in accordance with manufacturer's instructions.

B. Install frames plumb and level in openings. Secure rigidly in place, with plane of face panels aligned with adjacent finished surfaces.

C. Position units to provide convenient access to the concealed work requiring access.

3.03 ADJUSTING

A. Adjust hardware and panels after installation for proper operation.

B. Remove and replace panels or frames which are warped, bowed, or otherwise damaged.

END OF SECTION

SECTION 08 33 26

OVERHEAD COILING GRILLES

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for the following:

a. Overhead coiling metal grilles and operating hardware, and electric operation.

b. Wiring from electric circuit disconnect to operator and wiring to control station.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. American Society for Testing and Materials International (ASTM):

a. ASTM A666 Standard Specification for Annealed or Cold-Worked Austenitic Stainless-Steel Sheet, Strip, Plate, and Flat Bar.

b. ASTM B169/B169M - Standard Specification for Aluminum Bronze Sheet, Strip, and Rolled Bar.

c. ASTM B221 - Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes.

2. National Electrical Manufacturers Association (NEMA):

a. NEMA 250 Enclosures for Electrical Equipment (1000 Volts Maximum).

b. NEMA ICS 2 Industrial Control and Systems – Industrial Control and Systems Controllers, Contractors and Overload Relays Rate 600 Volts.

c. NEMA MG 1 Motors and Generators.

3. Underwriters Laboratories Inc. (UL):

a. UL 325 Door, Drapery, Gate Louver, and Window Operators and Systems.

1.03 COORDINATION

A. Provide setting drawings, templates and instructions for inserts and anchors which must be set into other construction. Coordinate delivery to avoid delays.

1.04 SUBMITTALS

A. Product Data: Submit general construction, component connections and details, and electrical equipment including motors.

B. LEED Submittals:

1. Where LEED certification is required by the project, submit the same documentation for approval as required by GBCI as a project submittal. Highlight the relevant LEED information.

2. LEED documentation is to be submitted separately and titled LEED SUBMITTAL.

3. Building Product Disclosure and Optimization credit data: Submit data to support the LEED SUBMITTAL.

C. Shop Drawings: Indicate details and dimensions of installation including tracks, structural supports, connection points, anchorage methods, closures, hardware locations, locations of control boxes and installation details. Shop drawings to be project specific.

D. Wiring Diagrams: Submit for coordination with the electrical subcontractor.

E. Samples: Submit four (4) each for grille members, 8 inches by 10 inches in size illustrating shape, color and finish texture.

F. Manufacturer's Instructions: Indicate installation sequence and procedures, adjustment and alignment procedures.

G. Maintenance Data: Indicate lubrication requirements and frequency.

H. Spare Parts List: Submit recommended spare parts list, together with parts numbers, prices and photographs, or catalog cuts of spare parts.

I. Warranty: Submit manufacturer warranty and ensure forms have been completed in Sound Transit's name and registered with manufacturer.

1.05 QUALITY ASSURANCE

A. Manufacturer’s Qualifications: Furnish each assembly as a complete unit produced by a single manufacturer, including hardware, operators, controls, accessories and installation components.

B. Regulatory Requirements:

1. Products Requiring Electrical Connection: Listed and classified by Underwriters Laboratories Inc. as suitable for the purpose specified and indicated.

1.06 PROJECT CONDITIONS

A. Field measurements: Check actual locations of walls, slabs, framing, and other construction to which work of this section must fit, by accurate field measurements before fabrication; show recorded measurements on final shop drawings. Coordinate fabrication, delivery and installation schedule with construction progress to avoid delay of work.

B. Where field measurements cannot be made without delaying the Work, guarantee dimensions and proceed with fabrication of products without field measurements. Coordinate construction with work of other trades to ensure that actual dimensions correspond to guaranteed dimensions. Allow for fitting and trimming.

1.07 WARRANTY

A. Special Warranty: Furnish door manufacturer's single source warranty agreeing to repair or replace counterbalance mechanism should any failure or malfunction occur prior to reaching 20,000 cycles; other components shall be warranted for a period of two years. Warranty shall be inclusive of all labor and materials, and not limited to original cost of materials and labor.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Overhead Coiling Grille:

1. Cornell Iron Works, Inc.

2. Overhead Door.

3. Wayne Dalton.

2.02 COMPONENTS

A. Service Overhead Coiling Door: Overhead coiling door formed with curtain of interlocking metal slats.

B. Operation Cycles: Door components and operators capable of operating for not less than 20,000. One operation cycle is complete when a door is opened from the closed position to the fully open position and returned to the closed position:

1. Include tamperproof cycle counter.

C. Door Curtain: Provide one of the following:

1. Aluminum slats.

2. Stainless steel bars.

D. Bottom Bar: Manufacturer’s standard and finished to match door.

E. Gasket Seal. Manufacturer's standard continuous gaskets between slats.

F. Curtain Jamb Guides: Steel angles with exposed finish matching curtain slats.

G. Hood: Material and finish to match curtain:

1. Mounting: Face of wall.

H. Locking Devices: Equip door with interlock switch for automatic operator.

I. Motor Enclosure for Exterior Mounted Grille: Same material and finish as specified for hood enclosure to conceal motor from all sides. Provide locking hinged bottom for access to manual override chain. Provide chain keeper inside enclosure for securing of chain.

2.03 DOOR CURTAIN MATERIALS AND CONSTRUCTION

A. Aluminum Door Curtain Slats: ASTM B169/B169M and/or ASTM B221

1. Fabricate overhead coiling door curtain of interlocking metal slats in a continuous length for width of door without splices. Unless otherwise indicated, provide slats of thickness and mechanical properties recommended by door manufacturer for performance, size, and type of door indicated, and as follows:

a. Flat profile slats of 2-5/8-inch (67-mm) center-to-center height.

b. No. 5F, 16-gauge (0.050 mm) aluminum.

c. Finish:

1) Powder Coat: Zirconium pre-treatment followed by baked-on polyester powder coat minimum 2.5 mils (0.065 mm) cured film

thickness; ASTM D-3363 pencil hardness: H or better. Color as selected by Architect from manufacturer's color range.

B. Stainless Steel bars: ASTM A666

1. Fabricate curtain with round horizontal bars minimum 5/16-inch diameter spaced minimum 1 1/2 inch on center connected with vertical links spaced 6 inch on center:

a. Type 304 Stainless steel; horizontal bar curtain, coiling on overhead counterbalanced shaft:

1) Finish: Satin Finish: No. 4.

C. Provide ends with nylon runners for quiet operation.

D. Bottom Bar: Manufacturer’s standard and finished to match door:

1. Compatible with safety edge.

E. Curtain Jamb Guides: Manufacturer's standard angles or channels and angles of same material and finish as curtain slats unless otherwise indicated, with sufficient depth and strength to retain curtain, to allow curtain to operate smoothly, and to withstand loading. Slot bolt holes for guide adjustment. Provide removable stops on guides to prevent overtravel of curtain.

2.04 HOODS

A. General: Form custom sheet metal hood to entirely enclose coiled curtain, operating mechanism and electrical components and conduits at opening head. Contour to fit end brackets to which hood is attached. Roll and reinforce top and bottom edges for stiffness. Form closed ends for surface-mounted hoods and fascia for any portion of between-jamb mounting that projects beyond wall face. Equip hood with intermediate support brackets as required to prevent sagging:

1. Sheet metal of same material as grille; minimum 0.0375 inch thick; finish to match curtain.

B. Motor Enclosure for Exterior Mounted Grille: Same material and finish as specified for hood enclosure to fully conceal motor from all sides:

1. Operational hinged bottom for manual override chain. Provide chain keeper inside enclosure for securing of chain.

2.05 EQUIPMENT

A. Electric Operation:

1. Electric Operators:

a. Mounting: Side mounted.

b. Motor Enclosure:

1) Exterior grilles: NEMA MG 4X.

2) Interior grilles: NEMA MG 1 Type I; open drip proof.

c. Motor Rating: 1/2 horsepower; continuous duty.

d. Motor Voltage: 208 volt, 3-phase, 60 Hz.

e. Motor Controller: NEMA ICS 2 Part 8, full voltage, reversing magnetic motor starter.

f. Controller Enclosure: NEMA 250, Type 1.

g. Opening Speed: 12 inches per second.

h. Brake: Adjustable friction clutch type, activated by motor controller.

i. Emergency operation for egress:

1) Provide coiling grille motors with on-board UPS system for emergency powered operation.

2) Provide at wall or post mounted “mushroom” button with hinged clear plastic cover to disengage motor operator and automatically open door for emergency egress when button is pressed. Locate the wall or post-mounted interior emergency exit button away from reach through the door:

a) No emergency exit button is required where an adjacent man door is provided with panic hardware.

3) Provide electric lock at bottom bar synchronized with emergency egress and access control functions.

2. Control Station: Basis of design:

a. Enclosure: Schneider Electric 9001KYSS3, NEMA 4 rated stainless steel control station.

b. Face plate: stainless steel engraved with OPEN-STOP-CLOSE.

c. Buttons: Schneider Electric 9001KR1BH13 NEMA 4 rated flush head push button. Recessed mounting.

d. Provide a Controls Station at both interior and exterior sides of the door if there is no adjacent man door. Provide at only interior if there is an adjacent man door.

e. Provide access control card readers to avoid unauthorized operation.

3. Safety Edge: Located at bottom of curtain, full width, electro-mechanical sensitized type, wired to stop operator upon striking object, hollow neoprene covered.

4. Remote Monitoring and Control: Provide Remote Interface Terminal Strip inside the door control station for remote monitoring and control of coiling door or grille:

a. Terminal blocks shall accept up to #14AWG wire.

b. Wire to left side of terminal blocks. Right side for remote interface terminations by others.

c. Two terminal blocks per monitoring or control.

d. Label blocks as shown in the table below.

e. Point functionality as defined in table below.

f. Wetting voltage nominally 24VDC.

Remote Interface Terminal Strip				
Type	**Operation/PLC IO Description**	**Dry Contact Function**		
		NO/NC	Open State	Close State
Status	Open-Maintained	NO	Not fully Opened	Fully Opened
Status	Closed-Maintained	NO	Not fully Closed	Fully Closed
Control	Permissive Command -from LCC or Lenel- (Momentary)	NO	No operation	Allow local door operation
Control	Open Command (Momentary)	NO	No operation	Open door
Control	Close Command (Momentary)	NO	No operation	Close door
Status	Intrusion Alarm (Momentary)	NC	Alarm	No operation

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine substrates areas and conditions, with Installer present, for compliance with requirements for substrate construction and other conditions affecting performance of the Work.

B. Examine locations of electrical connections.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

A. Install grill unit assembly and operating equipment complete with necessary hardware, anchors, inserts, hangers, and equipment supports in accordance with manufacturer's instructions:

1. Power-Operated Grilles: Install according to UL 325.

B. Erection Tolerances:

1. Maintain dimensional tolerances and alignment with adjacent work.

2. Maximum Variation From Plumb: 1/16 inch.

3. Maximum Variation From Level: 1/16 inch.

C. Use anchorage devices to securely fasten assembly to wall construction and building framing without distortion or stress.

D. Securely and rigidly brace components suspended from structure. Secure guides to structural members only.

E. Fit and align assembly including hardware; level and plumb, to provide smooth operation.

F. Coordinate installation of electrical service and functioning wiring from disconnect to unit components with the requirements of Division 26, Electrical.

3.03 ADJUSTING

A. Adjust grille, hardware and operating assemblies for smooth and noiseless operation.

3.04 COMMISSIONING

A. Commission doors in accordance with Section 01 91 13 - General Commissioning Requirements, Section 07 08 00 - Commissioning of Building Enclosure, and Section 08 08 00 - Commissioning of Openings.

B. Coordinate with Commissioning (Cx) Authority, Building Envelope Commissioning (BECxA) Authority and Contractor’s Commissioning Coordinator.

3.05 CLEANING

A. Clean grille and components.

B. Touch-up, repair or replace damaged products before Substantial Completion.

C. Remove protective films, temporary labels, and visible markings.

END OF SECTION

SECTION 08 36 20

VERTICAL LIFT DOORS

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for the following:

a. Aluminum Vertical Lift Doors

b. Electric Operators and Controls.

c. Operating Hardware, tracks, and support.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents.

1. ASTM International (ASTM):

a. ASTM A36/A36M - Standard Specification for Carbon Structural Steel

b. ASTM A924/A924M - Standard Specification for General Requirements for Steel Sheet, Metallic-Coated by the Hot-Dip Process

c. ASTM B221 - Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes

2. National Electrical Manufacturers Association (NEMA):

a. NEMA ICS 2 - Industrial Control and Systems – Industrial Control and Systems Controllers, Contractors and Overload Relays Rate 600 Volts.

b. NEMA MG 1 - Motors and Generators.

3. Underwriters Laboratories, Inc. (UL):

a. UL 325 - UL Standard for Safety Door, Drapery, Gate, Louver, and Window Operators and System

1.03 SUBMITTALS AND TRANSMITTALS

A. Submit the following:

1. Shop Drawings: Indicate plans and elevations including opening dimensions and required tolerances, connection details, and installation details.

B. LEED Submittals:

1. Where LEED certification is required by the project, submit the same documentation for approval as required by GBCI as a project submittal. Highlight the relevant LEED information.

2. LEED documentation is to be submitted separately and titled LEED SUBMITTAL.

3. Building Product Disclosure and Optimization credit data: Submit data to support the LEED SUBMITTAL.

C. Transmit the following:

1. Product Data: Manufacturer's data sheets on each product to be used, including:

a. Preparation instructions and recommendations.

b. Storage and handling requirements and recommendations.

c. Installation methods.

2. Manufacturer's Certificates: Certify products meet or exceed specified requirements.

3. Operation and Maintenance Data.

4. Warranty.

1.04 QUALITY ASSURANCE

A. Manufacturer Qualifications: Company specializing in manufacturing products specified in this Section with minimum five years documented experience.

B. Installer Qualifications: Authorized representative of the manufacturer with minimum five years documented experience.

C. Products Requiring Electronic Connections: Listed and classified by Underwriters Laboratories, Inc. acceptable to authority having jurisdiction as suitable for purpose specified.

1.05 DELIVERY, STORAGE AND HANDLING

A. Protect materials from exposure to moisture until ready for installation.

B. Store materials in a dry location.

1.06 PROJECT CONDITIONS

A. Pre-Installation Conference: Convene a pre-installation conference just prior to commencement of field operations, to establish procedures to maintain optimum working conditions and to coordinate this work with related and adjacent work.

1.07 WARRANTY

A. Special Manufacturer's Warranty: Manufacturer agrees to repair or replace:

1. Door and Operator components that fail in materials or workmanship withing Five (5) from date of Acceptance.

2. Counterbalance mechanisms failing or malfunctioning prior to reaching 20,000 cycles.

PART 2 - PRODUCTS

2.01 DESIGN / PERFORMANCE REQUIREMENTS

A. Wiring Connections Requirements for electrical characteristics:

1. Coordinate with electrical contractor to provide all wiring connections required for complete and functional door operation including motor, controls and Access Control System.

B. Single-Source Responsibility:

1. Provide doors, tracks, motors, and accessories from one manufacturer for each type of door.

2. Provide secondary components from source acceptable to manufacturer of primary components.

2.02 MANUFACTURERS

A. Basis of Design Manufacturer: Davis Door Service Inc.

B. Acceptable Manufacturers, Subject to compliance with requirements:

1. Amarr Doors.

2. EPD Electric Power Door.

3. International Door, Inc.

2.03 ALUMINUM VERTICAL LIFT DOOR

A. Aluminum Vertical Lift Door: Units shall have the following characteristics:

1. Door Assembly:

a. Fabricate vertical lift panels consisting of welded aluminum tube frame with sheet overlay.

b. Aluminum tube: ASTM B221 6063-T52.

c. Welded construction frame.

d. Mechanically attached perforated sheet selected from manufacturer's standard perforation patterns.

e. Steel shapes, plates and bars: ASTM A36.

2. Counterbalance System: Counterbalance door by means of roller chains, sprockets, and steel counterweights traveling in one common galvanized steel counterweight tower. This system uses heavy duty, 4 bolt cast flange bearings and solid keyed stress proof shafts.

3. Steel Structural Towers: 10 gauge hot dipped galvanized ASTM A924

4. Bottom of Door:

a. Manufacturer's standard, 2 wire, reversing electric sensing edge, bottom seal combination.

5. Finish and Color: Powder Coating Finish or Clear Anodized:

a. Color as indicated on drawings.

6. Wind Load Design: Provide to meet the design pressures as indicated on the structural drawings.

7. Locking: Panel locks to prevent lifting and bottom arrester/lifting catches.

8. Track: extruded aluminum to minimize contact with continuous UHMW guide strips, eliminating metal to metal contact, reducing noise and vibration. They will allow the door to breakaway in the event of impact with a vehicle.

9. Electric Motor Operation:

a. Industrial duty Hy Security HYS-Hydralift-20-UPS. Or approved Equal:

1) Opening speed: Min 12 inches per second with soft start and stop.

b. Sending Device Protection: Non-Contact Photoelectric sensing edge. Monitored to meet UL 325.

c. Operator Enclosure:

1) SST finish.

2) NEMA MG Type 4X.

d. Controls Station: Basis of Design:

1) Enclosure: Schneider Electric 9001KYSS3, NEMA 4 rated stainless steel control station.

2) Face plate: stainless steel engraved with OPEN-STOP-CLOSE.

3) Buttons: Schneider Electric 9001KR1BH13 NEMA 4 rated flush head push button. Recessed mounting.

4) Provide a Controls Station at both interior and exterior sides of the door if there is no adjacent man door. Provide at only interior location if there is an adjacent man door.

5) Provide access control card readers to avoid unauthorized operation.

10. Emergency Operation for egress:

a. Equip motorized vertical lift gates with on-board UPS system for emergency powered operation.

b. Provide at wall or post mounted “mushroom” button with hinged clear plastic cover to disengage motor operator and automatically open door for emergency egress when button is pressed. Locate the wall or post-mounted interior emergency exit button away from reach through the door:

1) No emergency exit button is required where an adjacent man door is provided with panic hardware.

c. Provide electric lock at bottom bar synchronized with emergency egress and Access Control functions.

11. Remote Monitoring and Control: Provide Remote Interface Terminal Strip inside the door control station for remote monitoring and control of vertical lift door:

a. Terminal blocks shall accept up to #14AWG wire.

b. Wire to left side of terminal blocks. Right side for remote interface terminations by others.

c. Two terminal blocks per monitoring or control.

d. Label blocks as shown in the table below.

e. Point functionality as defined in table below.

f. Wetting voltage nominally 24VDC.

Remote Interface Terminal Strip				
Type	Operation/PLC IO Description	Dry Contact Function		
		NO/NC	Open State	Close State
Status	Open-Maintained	NO	Not fully Opened	Fully Opened
Status	Closed-Maintained	NO	Not fully Closed	Fully Closed
Control	Permissive Command -from LCC or Lenel- (Momentary)	NO	No operation	Allow local door operation
Control	Open Command (Momentary)	NO	No operation	Open door
Control	Close Command (Momentary)	NO	No operation	Close door
Status	Intrusion Alarm (Momentary)	NC	Alarm	No operation

12. Additional Requirements:

    a. Weather-stripping for exterior doors:

        1) Provide manufacturer’s standard track with continuous jamb angles and perimeter seals at head and jambs to achieve weather tight enclosure at jambs.

        2) Provide manufacturer’s standard replaceable vinyl or resilient rubber door bottom full-length.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Do not begin installation until openings have been properly prepared.

B. Verify wall openings are ready to receive work and opening dimensions and tolerances are within specified limits.

C. Verify electric power is available and of correct characteristics.

3.02 PREPARATION

A. Clean surfaces thoroughly prior to installation.

B. Prepare surfaces using the methods recommended by the manufacturer for achieving the best result under the project conditions.

3.03 INSTALLATION

A. Install steel towers and aluminum vertical lift panels in accordance with approved shop drawings and the manufacturer's printed instructions.

B. Coordinate installation with adjacent work to ensure proper clearances and allow for maintenance.

C. Anchor assembly to wall construction and building framing without distortion or stress.

D. Fit and align door assembly including hardware.

E. Coordinate installation of electrical service. Complete power and control wiring from disconnect to unit components.

F. Instruct Owner’s personnel in proper operating procedures and maintenance schedule.

3.04 ADJUSTING

A. Test for proper operation and adjust as necessary to provide proper operation without binding or distortion.

B. Adjust hardware and operating assemblies for smooth and noiseless operation.

3.05 COMMISSIONING

A. Commission doors in accordance with Section 01 91 13 - General Commissioning Requirements, Section 07 08 00 - Commissioning of Building Enclosure, and Section 08 08 00 - Commissioning of Openings.

B. Coordinate with Commissioning (Cx) Authority, Building Envelope Commissioning (BECxA) Authority and Contractor’s Commissioning Coordinator.

3.06 CLEANING

A. Clean gates with non-abrasive materials and methods recommended by manufacturer.

B. Touch-up, repair or replace damaged products before Substantial Completion.

END OF SECTION

SECTION 08 71 00

DOOR HARDWARE

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for the following:

a. Hardware as indicated and specified herein for hollow steel, aluminum, and wood doors, including appropriate fasteners and miscellaneous materials required to complete the Work.

b. Hardware for fire-rated and non-rated doors.

c. Electrically operated and controlled hardware.

d. Lock cylinders for doors for which hardware is specified in other sections.

e. Thresholds.

f. Weather stripping, seals and door gaskets.

g. Latch guard plates.

h. Complete hardware schedule preparation. The drawings and specifications are indications of the design intent for the Project. Full provision of an itemized hardware schedule shall be the responsibility of the Contractor.

1.02 REFERENCES

A. This Section incorporates by reference the latest revision of the following documents:

1. American National Standards Institute (ANSI) / International Code Council (ICC):

a. ANSI/ICC A117.1 - American National Standard for Accessible and Usable Buildings and Facilities.

2. American National Standards Institute (ANSI) / Builders Hardware Manufacturers Association, Inc. (BHMA):

a. ANSI/BHMA A156.3 - Exit Devices.

b. ANSI/BHMA A156.6 - Architectural Door Trim.

c. ANSI/BHMA A156.16 - Auxiliary Hardware.

d. ANSI/BHMA A156.18 - Materials and Finishes.

e. ANSI/BHMA A156.22 - Gasketing.

f. ANSI/BHMA A156.23 - Electromagnetic Locks.

g. ANSI/BHMA A156.29 - Exit Locks, Exit Alarms, Alarms for Exit Devices.

h. ANSI/BHMA A156.31 - Electric Strikes and Frame Mounted Actuators.

3. Door and Hardware Institute (DHI):

a. DHI (LOCS) - Recommended Locations for Architectural Hardware for Standard Steel Doors and Frames.

4. National Fire Protection Association (NFPA):

a. NFPA 80 - Standard for Fire Doors and Other Opening Protectives.

b. NFPA 101 - Life Safety Code.

5. National Wood Window and Door Association:

a. NWWDA Industry Standard I.S.1.7 - Hardware Locations for Wood Flush Doors.

1.03 COORDINATION

A. Prior to installation of electronic hardware, arrange conference between Supplier, installers and related trades to review materials, procedures and coordinating related work.

B. Installation Templates: Distribute for doors, frames, and other work specified to be factory prepared. Check Shop Drawings of other work to confirm that adequate provisions are made for locating and installing door hardware to comply with indicated requirements.

C. Systems Integration: Coordinate all door hardware components necessary for completely functional door control and reporting systems.

1. Include manual locking, access control, intrusion detection, and fire alarm activated systems.

2. Coordinate layout and installation of electrified door hardware with power and communication connections required for their operation.

D. Safety and Security: Coordinate door hardware components specified in this Section with Owner’s security consultant.

1.04 SUBMITTALS

A. Submit:

1. Hardware Schedules and Product Data:

a. Hardware schedules to be in vertical format, listing each door opening, and organized into “hardware sets” indicating complete designations of every item required for each door opening to function as intended. Note any special mounting instructions or requirements with the hardware schedule. Each schedule to include the following information:

1) Location of each hardware set shall be cross-referenced with on the door schedule on the drawings.

2) Handing and degree of swing of each door.

3) Door and frame sizes and materials.

4) Keying information.

5) Type, style, function, size, and finish of each hardware item.

6) Elevation drawings and operational descriptions for all electrified openings.

7) Name and manufacturer of each hardware item.

8) Fastenings and other pertinent information.

9) Explanation of abbreviations, symbols and codes contained in schedule.

10) Mounting locations for hardware when varies from standard.

11) Certificates of compliance with STC, smoke, and fire-rating requirements.

2. Submit catalog cuts and/or Product Data sheets for all scheduled finish hardware.

3. Submit separate detailed keying schedule for approval.

4. Templates:

a. Furnish a complete list and suitable templates, together with finish hardware schedule to Contractor, for distribution to necessary trades supplying materials to be prepped for finish hardware.

B. Samples:

1. Upon request, samples of each type of hardware in finish indicated shall be submitted. Samples are to remain undamaged and in working condition through submittal and review process. Items will be returned to the Supplier or incorporated into the work within limitations of keying coordination requirements.

2. Electronic Hardware Systems:

a. Provide complete wiring diagrams prepared by an authorized factory employee for each opening requiring electronic hardware, except openings where only magnetic hold-open devices are specified. Provide a copy with each hardware schedule submitted after approval.

b. Provide complete operational descriptions of electronic components listed by opening in the hardware submittals. Operational descriptions to detail how each electrical component functions within the opening incorporating all conditions of ingress and egress. Provide a copy with each hardware schedule submitted for approval.

c. Provide elevation drawings of electronic hardware and systems identifying locations of the system components with respect to their placement in the door opening. Provide a copy with each hardware schedule submitted for approval.

C. Transmit:

1. Qualifications:

a. Architectural Hardware Consultant.

b. Supplier.

2. Samples.

3. Templates.

4. Warranties.

1.05 QUALITY ASSURANCE

A. Qualifications:

1. Contractor to employ an Architectural Hardware Consultant to coordinate all the hardware requirements for the project including electrified hardware. The Consultant should be currently certified by DHI as an Architectural Hardware Consultant (AHC) or as an Electrified Hardware Consultant (EHC).

2. A recognized architectural door hardware Supplier who has maintained an office and has been furnishing hardware in the Project's vicinity for a period of at least two (2) years.

3. Hardware Supplier shall be an authorized factory distributor of all products specified herein.

1.06 DELIVERY, STORAGE AND HANDLING

A. Marking and Packaging:

1. Properly package and mark items according to the approved hardware schedule, complete with necessary screws and accessories, instructions and installation templates for spotting mortising tools. Contractor shall check deliveries against accepted list and provide receipt for them, after which he is responsible for storage and care. Any shortage or damaged good shall be made without cost to the Owner.

2. Packaging of door hardware is the responsibility of the Supplier. As hardware Supplier receives material from various manufacturers, sort and repackage in containers clearly marked with appropriate hardware set and door numbers to match the approved hardware Schedule. Two or more identical sets may be packed in same container.

B. Delivery:

1. Hardware Supplier shall coordinate delivery times and schedules with the Contractor for delivery of all door hardware. Inventory door hardware jointly with representatives of hardware Supplier and hardware installer/Contractor until each is satisfied that count is correct.

2. No keys, other than construction master keys and/or temporary keys are to be packed in boxes with the locks.

3. At time of hardware delivery, door openings Supplier in conjunction with the Contractor shall check in all hardware and set up a hardware storage room.

C. Storage:

1. Provide secure lock-up for door hardware delivered to the Project, but not yet installed. Control handling and installation of hardware items that are not immediately replaceable so that completion of work will not be delayed by hardware losses both before and after installation.

1.07 WARRANTY

A. All items, except as noted below, shall be warrantied in writing by the manufacturer against failure due to defective materials and workmanship for a minimum period of two

(2) years. In the event of product failure, promptly repair or replace item with no additional cost to the owner:

1. Mortise locksets: Five (5) years.
2. Integrated Access Controlled Mortise Locksets: Two (2) years.
3. Electromagnetic locks: Five (5) years.
4. Exit Devices: Five (5) years.
5. Integrated Access Controlled Exit Devices; Two (2) years.
6. Door closers: Twenty (20) years.
7. Securitron (and approved equals) electrified hardware: Lifetime.
8. Hinges and Continuous Hinges: Lifetime.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. Fire-Rated Openings:

1. Provide door hardware for fire-rated openings that comply with NFPA 80 and requirements of authorities having jurisdiction. Provide only items of door hardware that are listed by Underwriter's Laboratories (UL) or Warnock Hersey (WH) for use on types and sizes of doors indicated.
2. Project requires door assemblies and components that are compliant with positive pressure and S-label requirements. Specifications shall be cross-referenced and coordinated with door manufacturers to ensure that total opening engineering is compatible with UL10C Standard for Positive Pressure Fire Tests of Door Assemblies.

B. Electronic Hardware:

1. The electrical products contained within this specification represent a complete engineered system. If alternate electrical products are submitted, it is the responsibility of the distributor to bear the cost of providing a complete and working system including re-engineering of electrical diagrams and system layout, as well as power transfers and all required electrical components. Coordinate with electrical engineer and electrician to ensure that line voltage and low voltage wiring is coordinated to provide a complete and working system.
2. For each item of electrified hardware specified, provide standardized molex plug connectors to accommodate up to twelve (12) wires. Molex plug connectors shall plug directly into through-door wiring harnesses, frame wiring harnesses, electric locking devices and power supplies.
3. Power supplies are to be provided by the access control subcontractor. Notify Resident Engineer of any proprietary power supply requirements for electronic hardware items provided.
4. For electronic hardware connected to Building Management System, confirm cybersecurity meets requirements of FAT test.

C. Means of Egress Doors:

1. Latches do not require more than 15 lbf to release the latch. Locks do not require use of a key, tool, or special knowledge for operation.

D. Accessibility Requirements: For door hardware on doors in an accessible route, comply with and ANSI/ICC A117.1:

1. Provide operating devices that do not require tight grasping, pinching, or twisting of the wrist and that operate with a force of not more than 5 lbf.

2. Comply with the following maximum opening-force requirements:

a. Interior, Non-Fire-Rated Hinged Doors: 5 lbf applied perpendicular to door.

b. Fire Doors: Minimum opening force allowable by authorities having jurisdiction.

3. Bevel raised thresholds with a slope of not more than 1:2. Provide thresholds not more than 1/2-inch high.

4. Adjust door closer sweep periods so that, from an open position of 90 degrees, the door will take at least 5 seconds to move to a position of 12 degrees from the latch.

5. Adjust spring hinges so that, from an open position of 70 degrees, the door will take at least 1.5 seconds to move to the closed position.

2.02 MANUFACTURERS

A. Obtain each type of finish hardware set (hinges, latch and locksets, access-controlled locks exit devices, access controlled exit devices, door closers, etc.) from a single manufacturer.

2.03 MATERIALS

A. All hardware installed for gates shall be 316 Stainless steel marine grade.

B. Screws and Fasteners:

1. All required screws shall be supplied as necessary for securing finish hardware in the appropriate manner. Thru-bolts shall be supplied for exit devices and door closers where required by code and the appropriate blocking or reinforcing is not present in the door to preclude their use.

C. Hanging Devices:

1. Hinges for Standard Doors:

a. Hinges shall conform to ANSI A156.1 and have the number of knuckles as specified, oil-impregnated bearings as specified with NRP (non-removable pin) feature, at all exterior reverse bevel doors. Unless otherwise scheduled, supply one (1) hinge for every 30 inches of door height, or fraction thereof (*). Hinges shall be a minimum of 4-1/2 inch high and 4- 1/2 inch wide; heavy weight hinges (.180) shall be supplied at all doors:

1) Approved manufacturers: McKinney, Ives, Hager, Best.

2. Continuous Stainless-Steel Hinges:

a. All hinges to be non-handed and of slim barrel design. Hinges to be made of type 304 stainless steel and shall have a concealed Teflon coated stainless steel pin with twin self-lubricated nylon bearings at each knuckle. Hinges shall be UL listed up to and including 3 hours and shall be available with power transfer cutouts when necessary:

1) Approved Manufacturers: Markar, McKinney, Select, ABH.

3. Heavy Duty Gate Hinges:

a. Heavy Duty Gate Hinges shall be designed to be welded to gates and supports, with greaseable ball bearing movement and designed for supporting a single gate leaf weighing minimum 1200 pounds.

b. Comply with manufacturer's recommendations for weights and location of hinges:

1) Approved Manufacturers': Hardware Source, Crown Industrial, or approved equal.

D. Flush Bolts and Accessories:

1. All manual and automatic flush bolts to be furnished as specified:

a. Approved Manufacturers: Rockwood, McKinney, Trimco.

E. Cylinders and Keying:

1. Construction Cylinders:

a. Manufacturer: To match hardware.

2. Permanent Cylinders:

a. Provide for Sound Transit Link Light Rail Stations. Cylinders shall be high security tested, drill & pick proof, extreme attack configured, patent protected in U.S. and Canada, and include a unique double row of pins:

1) Approved Manufacturer: BiLock.

b. Provide for Parking Garages, Sounder and ST Express facilities. Cylinders shall be high security tested, patent protected in U.S. and Canada, 7-pin interchangeable cores:

1) Approved Manufacturer: Best-KABA Peaks.

3. Keying:

a. All locks and cylinders shall be provided with construction cylinders/cores, for use during the construction phase. All permanent cores shall be keyed to the existing KABA Peaks or BiLock Master key system, per the approved key schedule. All keys shall be serialized. Provide the following quantity of keys:

1) Two (2) change keys per lock.

2) Six (6) master keys per master level.

3) Five (5) construction/temporary keys.

4) Two (2) construction core control keys.

5) Two (2) operational control keys.

4. Cylinder Installation:

   a. The general Contractor shall install all construction cylinders/cores at the time of hardware installation.

   b. The Contractor shall provide all permanent cylinders/cores to Sound Transit no later than 90 days before install. At no time shall the Contractor be in possession of the final keyed cylinders or keys.

   c. The Contractor shall coordinate with Sound Transit for the installation of the final keyed cylinders/cores. Installation of the permanent cylinders/cores will be performed by Sound Transit per the approved key schedule.

F. Locking Devices:

1. Mortise Locksets:

   a. All locksets shall be ANSI 156.13 Series 1000, Grade 1 Certified. All functions shall be manufactured in a single sized case formed from 12-gauge steel minimum. The lockset shall have a field-adjustable, with a .125 inch minimum thickness and shall be reversible without opening the lock body. The lockset shall be 2 3/4 inch backset with a 3/4 inch stainless steel latchbolt. The deadbolt shall be a full 1 inch throw made of stainless steel. All strikes shall be non-handed with a curved lip. To ensure proper alignment, all trim, shall be thru-bolted and fully interchangeable between rose and escutcheon designs and shall be the product of one manufacturer.

      1) Approved Manufacturers: Best 45H Series, Corbin ML Series, Schlage L series.

2. Electrified Locksets:

   a. Mechanical features of electrified locksets shall conform to standards as specified above. Locksets shall be fail-secure unless otherwise specified. Where specified, provide electrified locksets shall be provided with a switch to monitor inside or outside lever handle or signal remote location:

      1) Approved Manufacturers: Corbin Russwin, Schlage.

3. Integrated Access Control Locksets and Exit Device Trim:

   a. Mechanical features of locksets shall conform to standards as specified above. Locksets shall be fail-secure unless otherwise specified. Locksets shall be provided with a request to exit switch to monitor inside lever handle. Integrated reader to be HID iClass with bit encryption which meets DOT minimum requirements and is compatible with the owners Lenel system. Reader application shall transmit both serial and data information. Provide all necessary cables, door position switches, components, power supplies, battery back-up, relays, firmware updates as necessary for a complete and operational system. Cards to be provided by others.

      1) Approved Manufacturers: Corbin/Russwin LP10 Series, Schlage AD400, Best IDH max series.

4. Lockset Strikes:

a. Strikes shall be non-handed and available with curved lip, full lip or ASA type strikes as required. Provide strikes with lip-length required to accommodate jamb and/or trim detail and Projection.

G. Electrified Components:

1. Provide all hardware components necessary for complete, functioning electrically controlled and operated door systems.

2. Electric Strikes:

a. BHMA A156.31; Grade 1; with faceplate to suit lock and frame.

3. Power Transfer Devices:

a. Heavy duty electric power transfer devices to provide a concealed and secure means of transferring electric lock and exit device power and signal wires from the frame to the door.

b. Products to be completely concealed within the door frame.

4. Electromagnetic Locks:

a. Electromagnetic Locks: BHMA A156.23, with electromagnet attached to frame and armature plate attached to door.

b. Full-exterior or full-interior type, as required by application indicated.

H. Electrified Doors:

1. All doors required for the application of electronic locks, remote monitoring, door position switches, etc. which require the door to have wires through the door shall be provided pre-wired with a factory installed quick connect. The use of non-wired conduit in the door is not acceptable.

2. Provide all hollow metal frames receiving electrified hardware with through-frame wiring harness and concealed plug connectors on each end to accommodate up to twelve wires. Coordinate connectors on each end of the wiring harness to plug directly into the electrified hardware and the electric hinge.

I. Exit Devices:

1. Conventional Devices – Modern Push Pull Devices:

a. All exit devices shall be ANSI A156.3, Grade 1 Certified and shall be listed by Underwriters Laboratories and bear the UL label for life safety in full compliance with NFPA 80 and NFPA 101. Coordinate door style dimensions with exit device requirements. Provide request to exit switches and door contacts where integrated access control trim is utilized. Mounting rails shall be formed from a solid single piece of stainless steel, brass or bronze no less than 0.072 inch thick. Push rails shall be constructed of 0.062 inch thick material. Painted shall not be considered heavy duty and is not acceptable. Lever trim shall be available in finishes and designs to match that of the specified locksets.

1) Approved Manufacturer: Corbin, Precision 2000, Von Duprin.

J. Door and Gate Closers:

1. Surface-Mounted Closers – Heavy Duty:

   a. All door closers shall be ANSI 156.4, Grade 1 Certified. All closers shall have cast iron bodies, forged steel arms, and separate valves for adjusting backcheck, closing and latching cycles and adjustable spring to provide up to 50 percent increase in spring power. Closers shall be furnished with parallel arms mounting on all doors opening into corridors or other public spaces and shall be mounted to permit 180 degrees door swing wherever wall conditions permit. Closers shall not be installed on exterior or corridor side of doors, where possible install closers on door for optimum aesthetics:

      1) Approved Manufacturers: Corbin/Russwin DC6000 , Norton 7500, Best EDH9016, LCN 4000, Stanley QDC100.

   b. Swing door Automatic Door Operators- Electromechanical Operators shall be self-contained unit powered by a minimum 3/16 horsepower, permanent-magnet DC motor: through a high torque reduction gear system:

      1) Operation: Power opening and spring closing.

      2) Operator Type: Low energy; readily convertible to full energy; no tools required to change type.

      3) Handing: Non-handed; no tools required to change handing.

      4) Capacity: Rated for door panels weighing up to 600 lb.

      5) Approved Manufacturers: Assa Abloy, Dorma ED100LE.

2. Surface-Mounted, single action, Spring Hinge Closers:

   a. Swing Gate Automatic Closer:

      1) Operation: Manual pull to open, single action spring closer.

      2) Handing: Non-handed; no tools required to change handing.

      3) Capacity: Rated for Gates weighing up to 250 pounds (two spring hinges per leaf).

      4) Approved Manufacturers:

         a) Assa Abloy, Stanley, and approved equal.

K. Door Trim and Protective Plates:

1. Kick plates shall be .050 gauges and two (2) inches less full width of door, or as specified. All protective plates, door pulls and miscellaneous door trim shall be as shown in the hardware Schedule:

   a. Approved Manufacturers: Rockwood, McKinney, Trimco.

2. Wall-mounted Door Stops:

   a. Where a door is indicated on the plans to strike flush against a wall, wall bumpers shall be provided. Provide convex or concave design as indicated:

      1) Approved Manufacturers: Rockwood, McKinney, Trimco.

3. Latch Guard Plates: Minimum 12-gauge 316 Stainless Steel, unless noted otherwise, with jamb pin. No exposed fasteners:

    a. Provide guard configuration appropriate to door swing and handing coordinated to fit latching hardware.

    b. Provide Latch guard and fasteners recommend by manufacturer for doors in curtain wall and storefront frames.

    c. Approved Manufacturers: Rockwood, McKinney, Hager.

4. Overhead Stops/Holders:

    a. Overhead stops/holders are to be provided. Track, slide, arm and jamb bracket shall be constructed of extruded bronze and shock absorber spring shall be of heavy tempered steel. Overhead stops shall be of non-handed design:

        1) Approved Manufacturers: Rixson, ABH.

L. Gasketing and Thresholds:

1. Provide continuous weather seal on exterior doors. Provide smoke, light, or sound seals on interior doors where indicated or as scheduled. Provide intumescent seals as required to meet UL10C Standard for Positive Pressure Fire Tests of Door Assemblies. Provide only those units where resilient or flexible seal strip is easily replaceable and readily available from stocks maintained by manufacturer.

    a. Smoke Seals: Self- extinguishing silicone, Smoke tested, UL10C.

    b. Intumescent Seals: Fire Rated- Edge Seals- UL10C.

    c. Acoustic Seals: Meeting ASTM E 90.

    d. Automatic Door Bottoms: Meeting the above standards for fire rated and acoustic openings as indicated or scheduled.

2. Door Gasketing: BHMA A156.22; with resilient or flexible seal strips that are easily replaceable and readily available from stocks maintained by manufacturer.

3. Maximum Air Leakage, Exterior Doors: When tested according to ASTM E 283/ E 283M with tested pressure differential of 0.3-inch wg, as follows:

    a. Gasketing on Single Doors: 0.3 cfm/sq. ft. of door opening.

    b. Gasketing on Double Doors: 0.50 cfm per foot of door opening.

4. Acoustical Assemblies:

    a. Provide sound gasketing and thresholds that comply with STC ratings indicated on the Drawings.

    b. Provide in accordance with the requirements of ASTM E 1289 when tested in accordance with ASTM E 90.

5. Smoke-Controlled Assemblies

    a. Provide smoke gasketing at doors in smoke barriers indicated on the Drawings.

b. Provide in accordance with the requirements of NFPA 105 when tested in accordance with UL 1784.

6. Thresholds: Provide threshold units not less than 4 inch wide, formed to accommodate change in floor elevation where indicated, fabricated to accommodate door hardware and to fit door frames. All threshold units shall comply with the Americans with Disabilities Act (ADA):

a. Approved Manufacturers: Pemko, Reese, Zero, National Guard.

M. Door Silencers:

1. Except at smoke-sealed, weather-stripped and acoustic-sealed doors, Resilient rubber, fitted into drilled hole; three on strike side of single door, three on center mullion of pairs, and two on each head of pairs without center mullions.

N. Exit Locks and Exit Alarms:

1. Exit Locks and Alarms: BHMA A156.29, Grade 1.

O. Manual Flush Bolts for Doors Not Used for Egress:

1. Manual Flush Bolts: BHMA A156.16; minimum 3/4-inch throw; designed for mortising into door edge.

P. Automatic and Self-Latching Flush Bolts:

1. Automatic Flush Bolts: BHMA A156.3, Type 25; minimum 3/4-inch throw; with dust-proof strikes; designed for mortising into door edge.

2. Self-Latching Flush Bolts: BHMA A156.3, Type 27; minimum 3/4-inch throw; with dust-proof strikes; designed for mortising into door edge.

Q. Exit Devices and Auxiliary Items:

1. Exit Devices and Auxiliary Items: BHMA A156.3.

R. Power Supplies:

1. Power supplies to be provided as part of the access control system unless otherwise specified.

2.04 ACCESSORIES FOR PAIRS OF DOORS

A. Coordinators: BHMA A156.3; consisting of active-leaf, hold-open lever and inactive-leaf release trigger; fabricated from steel with nylon-coated strike plates; with built-in, adjustable safety release.

B. Carry-Open Bars: BHMA A156.3; prevent the inactive leaf from opening before the active leaf; provide polished brass or bronze carry-open bars with strike plate for inactive leaves of pairs of doors unless automatic or self-latching bolts are used.

C. Astragals: BHMA A156.22.

2.05 METAL PROTECTIVE TRIM UNITS

A. Metal Protective Trim Units: BHMA A156.6; fabricated from 0.050-inch-thick stainless steel; with manufacturer's standard machine or self-tapping screw fasteners.

2.06 FINISHES

A. 630 Satin Stainless Steel finish required unless noted otherwise. Items specified in stainless steel should be provided in stainless steel with no exceptions.

B. The designations used in schedules and elsewhere to indicate hardware finishes are those listed in ANSI/BHMA A156.18 or traditional U.S. finishes shown by certain manufacturers for their products.

C. Provide quality of finish, including thickness of plating or coating (if any), composition, hardness, and other qualities complying with manufacturer's standards, but in no case less than specified by referenced standards for the applicable units of hardware.

D. Where specified hardware shall have an antimicrobial coating which permanently suppresses the growth of bacteria, algae, fungus, mold and mildew applied. The finish shall control the spread and growth of bacteria, mold and mildew and shall be FDA listed for use in medical and food preparation equipment.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Contractor shall ensure that the building is secured and free from weather elements prior to installing interior door hardware. Examine hardware before installation to ensure it is free of defects.

B. Verify that doors and frames are ready to receive work; labeled, fire-rated doors and frames are present and properly installed, and dimensions are as indicated on shop drawings.

C. Verify that electric power is available to power-operated devices and of the correct characteristics.

3.02 INSTALLATION

A. Mount hardware units at heights indicated in the following applicable publications, except as specifically indicated or required to comply with the governing regulations:

1. DHI (LOCS) - Recommended Locations for Architectural Hardware for Standard Steel Doors and Frames.

2. NWWDA Industry Standard I.S.1.7

B. All hardware shall be applied and installed in accordance with best trade practice by an experienced hardware installer. Care shall be exercised not to mar or damage adjacent work.

C. Install each hardware item in compliance with the manufacturer's instructions and recommendations. Where cutting and fitting is required to install hardware onto or into surfaces that are later to be painted or finished in another way, coordinate removal, storage, and reinstallation or application of surface protection. Do not install surface-mounted items until finishes have been completed on the substrates involved.

D. Installer shall install all integrated access control cabling from locks and exit devices thru doors and frame and terminating at junction box (furnished and installed under this contract).

E. Special care shall be taken to coordinate installation of access-controlled doors installed in storefront and curtain wall applications to ensure concealed pathways are provided for cabling within aluminum frames.

F. Thresholds: Set thresholds for exterior doors in full bed of synthetic rubber sealant.

G. Stops: Provide floor stops for doors unless wall or other types of stops are indicated on the door hardware schedule. Do not mount floor stops where they will impede traffic or cause trip hazards.

H. Perimeter Gasketing: Apply to head and jamb, forming seal between door and frame.

I. Do not notch perimeter gasketing to install other surface-applied hardware.

J. Meeting Stile Gasketing: Fasten to meeting stiles, forming seal when doors are closed.

K. Door Bottoms: Apply to bottom of door, forming seal with threshold when door is closed.

3.03 FIELD QUALITY CONTROL

A. The Contractor shall do a final inspection prior to building completion to ensure that all hardware was correctly installed and is in proper working order.

B. Complete commissioning and testing of integrated access control and electrified hardware in accordance with Sound Transit requirements.

C. Refer to specification 08 08 00 for additional Commissioning and testing requirements.

3.04 ADJUSTING, CLEANING, AND DEMONSTRATING

A. Adjust and check each operating item of hardware and each door to ensure proper operation or function of every unit. Replace units that cannot be adjusted to operate freely and smoothly or as intended for the application made.

B. Clean operating items as necessary to restore to proper function and finish of hardware and doors. Adjust door control devices to compensate for final operation of heating and ventilating equipment.

C. Instruct owner's personnel in the proper adjustment and maintenance of door hardware and hardware finishes and usage of any electronic devices.

3.05 PROTECTION

A. Contractor shall protect all hardware, when stored on the construction site ensure that is in in a covered and dry place. Protect exposed hardware installed on doors during the construction phase.

3.06 DOOR HARDWARE GROUPS

A. Functionality of each door is indicated on the Door Schedules and the Security Drawings on the Issued for Construction Drawings.

B. Door hardware sets are as indicated in Hardware Schedule.

END OF SECTION

APPENDICES: (On Following Pages)

1. Appendix A – Hardware Schedule

APPENDIX A - HARDWARE SCHEDULE TEMPLATE

SECTION 08 71 00

MANUFACTURERS ABBREVIATIONS	
AA	Assa Abloy
AR	Adams Rite
BI	Bi Lock
BO	Bommer
CR	Corbin Russwin
LY	Lockey
MA	Makar
MC	McKinney
NA	National
PE	Pemko
RE	Reese
RO	Rockwood
RX	Rixson
SDC	SDC
SN	Securitron
VD	Von Duprin (Allegion)
ZE	Zero

To be completed by the design team

NOTES TO DESIGNER: Complete the hardware schedule by assigning appropriate hardware set #s and components to each door on the project. For doors with electronic components, fill in the sequence of operations. Manufacturer abbreviations are included in the table. Additional Manufacturers and abbreviations may be added as necessary. One example is completed for SET #1 below.

Refer to STRM set 801 for Security Groups. The appropriate Security Group must be designated for each hardware set. The commissioning and testing procedures in Standard Specification 08 08 00 are set by security group. Coordinate with the ST Specification owner for 08 08 00 for Testing and Commissioning Requirements.

EXAMPLE SET #1

Doors: [#]– Security Group [A]

HARDWARE	MODEL #	FINISH	MFR
* Hinges	T4A3386 NRP	*32D* *	MC
1 EPT (Power Transfer Hinge)	TA386-QC8 X 48 inch LEAD WIRE	32D	MC
EM Lock (Storeroom)	ML20905PSA	630	CR
1 Permanent Core	PI2301QC	26D	BL
1 Mortise Cylinder	5361QC X CC (VERIFY CAM)	26D	RO
1 Latch Protector	325	26D	RO
1 Flush Bolt (top)	555-24 inch	26D	RO
1 Flush Bolt (bottom)	555-12 inch	26D	RO
2 Overhead Stops (Surface)	9 SERIES	32D	RO
2 Kick Plates	K1050	32D	RO
1 Threshold	171AX FHSL25	A	PE
2 Gasket	S88D (HEAD & JAMB)		PE
1 Door Sweep	315CN		PE
1 Astragal	357SP X S88D X TB	US9	PE
2 Door Position Switches	DPS-M-GY		SN
Power Supply	Provided by Access Control Integrator		
Card Reader	Provided by Access Control Integrator		

SEQUENCE OF OPERATION:

- Normally locked on the pull side.
- Free egress at all times from the push side.
- Door open position switches (DPS) signal Security Systems when either leaf is open.
- Card Reader (Request to exit device) momentarily unlocks EM lockset (active leaf) and shunts DPS.

***Note For Finish**: Stainless steel is required per Article 2.04, unless otherwise indicated herein.

END OF APPENDICES

SECTION 08 80 00

GLAZING

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for glazing for the following:

   a. Curtain wall and storefronts with sealed insulated units.

   b. Curtain wall and storefront with single pane windows.

   c. Elevator hoist way glazing.

   d. Canopy and sloped glazing assemblies.

   e. Doors with Vision Glass Inserts.

   f. Smoke baffle assemblies.

   g. Bird collision deterrent glazing.

   h. Bullet-resistant glazing.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. American Society for Testing and Materials International (ASTM):

   a. ASTM C1021 – Standard Practice for Laboratories Engaged in Testing of Building Sealants.

   b. ASTM C1036 – Standard Specification for Flat Glass.

   c. ASTM C1048 - Standard Specification for Heat-Strengthened and Fully Tempered Flat Glass.

   d. ASTM C1172 - Standard Specification for Laminated Architectural Flat Glass.

   e. ASTM E1300 - Standard Practice for Determining Load Resistance of Glass in Buildings.

2. American Architectural Manufacturers Association (AAMA):

   a. AAMA 800 Voluntary Specifications and Test Methods for Sealants.

3. Code of Federal Regulations (CFR):

   a. 16 CFR 21 Part 1201 - Safety Standard for Architectural Glazing Materials.

   b. 40 CFR 59 Subpart D - National Volatile Organic Compound Emission Standards for Architectural Coatings.

4. Glass Association of North America (GANA):

   a. GANA (GM) Glazing Manual - Glass Association of North America.

5. American Bird Conservancy (ABC):

   a. Bird Collision Deterrence Material Threat Factor Reference Standard.

   b. Prescriptive Rating Guidelines for Bird-friendly Materials.

6. Underwriters Laboratories (UL):

   a. UL 752 - Protection Standards for Bullet Resistant Glass.

B. Definitions

1. Glass Manufacturers: Firms that produce primary glass, fabricated glass, or both, as defined in referenced glazing publications.

2. Glass Thicknesses: Indicated by thickness designations in millimeters according to ASTM C1036.

3. IBC: International Building Code.

4. Laminated glazing: single lite consisting of two or more layers of glass with one or more interlayers as specified herein.

5. Single Pane: Lite consisting of single piece of glass or laminated glass with thickness specified.

6. Interspace: Space between lites of an insulating glass unit.

7. Insulating glass unit is abbreviated “IGU” on the Drawings.

8. Insulated Glass Unit & coating orientation:

   a. Surface 1: Exterior surface of outer lite (surface facing outdoors of outboard lite).

   b. Surface 2: Interior surface of outer lite (surface facing indoors of outboard lite).

   c. Surface 3: Exterior surface of inner lite (surface facing outboard lite).

   d. Surface 4: Interior surface of inner lite (surface facing indoors of inboard lite).

1.03 COORDINATION

A. Preinstallation Conference: Conduct conference at Project site:

1. Review and finalize construction schedule and verify availability of materials, Installer’s personnel, equipment, and facilities needed to make progress and avoid delays.

2. Review temporary protection requirements for glazing during and after installation.

1.04 SUBMITTALS

A. Product Data: For each glass product and glazing material indicated.

B. LEED Submittals:

1. Where LEED certification is required by the project, submit the same documentation for approval as required by GBCI as a project submittal. Highlight the relevant LEED information.

2. LEED documentation is to be submitted separately and titled LEED SUBMITTAL.

3. Building Product Disclosure and Optimization credit data: Submit data to support the LEED SUBMITTAL.

C. Samples: Minimum 12 inches square:

1. Two (2) samples of each type of glass indicated.

2. Graffiti-resistant plastic film applied to 1/4-inch clear glass. Leave 3-inch-wide section untreated. Comply with requirements for water and graffiti repellents, as stated elsewhere in the Contract Documents, for graffiti-resistant plastic film material requirements.

3. Smoke baffle components including 12-inch lengths of finished shoe, glazing gasket and cap.

D. Glazing Schedule: List glass types and thicknesses for each size opening and location. Use same designations indicated on Drawings.

E. Delegated-Design Submittal: For glass indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer, registered in the State of Washington, responsible for their preparation.

F. Mock-up: As specified in “Quality Assurance” Article herein.

G. Statement of Qualifications: For Installer.

1.05 QUALITY ASSURANCE

A. Glass:

1. Manufacturer Qualifications for Insulating-Glass Units with Sputter-Coated, Low-E Coatings: A qualified insulating-glass manufacturer who is approved and certified by coated glass manufacturer.

2. Installer Qualifications: A qualified Installer who employs glass Installers for this Project who are certified under the National Glass Association's Certified Glass Installer Program.

3. Glass Testing Agency Qualifications: A qualified independent testing agency accredited according to the NFRC CAP 1 Certification Agency Program.

4. Sealant Testing Agency Qualifications: An independent testing agency qualified according to ASTM C1021 to conduct the testing indicated.

5. Safety Glazing Labeling: Where safety glazing labeling is indicated, permanently mark glazing with certification label of the SGCC, another certification agency acceptable to the Building Code Official, or the manufacturer. Label shall indicate manufacturer's name, type of glass, thickness, and safety glazing standard with which glass complies.

6. Mock-Up: Provide a mock-up for evaluation of surface preparation techniques and application workmanship:

a. Finish areas designated by Resident Engineer.

b. Do not proceed with remaining work until workmanship, color, and sheen are approved.

c. Refinish mock-up area as required to produce acceptable work.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Protect glazing materials according to manufacturer's written instructions. Prevent damage to glass and glazing materials from condensation, temperature changes, direct exposure to sun, or other causes.

B. Comply with insulating-glass manufacturer's written instructions for venting and sealing units to avoid hermetic seal ruptures due to altitude change.

1.07 PROJECT CONDITIONS

A. Environmental Limitations: Do not proceed with glazing when ambient and substrate temperature conditions are outside limits permitted by glazing material manufacturers and when glazing channel substrates are wet from rain, frost, condensation, or other causes:

1. Do not install glazing sealants when ambient and substrate temperature conditions are outside limits permitted by sealant manufacturer or are below 40 deg F (4.4 deg C).

1.08 PRECONSTRUCTION TESTING

A. Preconstruction Adhesion and Compatibility Testing: Test each glass product, tape sealant, gasket, glazing accessory, and glass-framing member for adhesion to and compatibility with elastomeric glazing sealants:

1. Testing is not required if data are submitted based on previous testing of current sealant products and glazing materials matching those submitted.

1.09 WARRANTY

A. Manufacturer's Special Warranty for Laminated Glass: Manufacturer agrees to replace laminated-glass units that deteriorate within specified warranty period. Deterioration of laminated glass is defined as defects developed from normal use that are not attributed to glass breakage or to maintaining and cleaning laminated glass contrary to manufacturer's written instructions. Defects include edge separation, delamination materially obstructing vision through glass, peeling and cracking, and blemishes exceeding those allowed by referenced laminated-glass standard:

1. Warranty Period: Ten years.

B. Special Warranty, Glass Seals: Provide a written warranty signed by the Manufacturer, the installer and the Contractor, agreeing to repair or replace glass sealing materials which have failed to provide airtight and watertight joints for any reason, or which appear to have failed in adhesion, cohesion, abrasion-resistance, migration-resistance, stain- resistance, general durability or other form of apparent deterioration (excluding inherent qualities and limitations clearly specified in the manufacturer’s data which was submitted):

1. Warranty Period: Ten years.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. General: Installed glazing systems shall withstand normal thermal movement and wind and impact loads (where applicable) without failure, including loss or glass breakage attributable to the following: defective manufacture, fabrication, or installation; failure of sealants or gaskets to remain watertight and airtight; deterioration of glazing materials; or other defects in construction.

B. Delegated Design: Engage a qualified professional engineer, experienced in design of this Work and licensed in the State of Washington, to design glazing and seal drawings.

C. Structural Performance: Glazing shall withstand the design loads within limits and under conditions indicated determined according to the applicable code and ASTM E1300, unless otherwise indicated on the Issued for Construction Drawings:

1. Wind load: positive and negative (inward and outward) wind pressures shall be determined by basic wind speed criteria by code. Minimum pressures, except where code allows for less, shall not be less than 20 psf positive and negative.

2. Temperature change (range): 120 degrees f ambient; 180 degrees f material surfaces. Base calculations on materials actual surface temperature due to both solar heat gain and nighttime sky heat loss.

3. Center deflection: for the following types of glass supported on all four edges, provide thickness required that limits center deflection at of the edge of the glass perpendicular to the glass pane, based on design wind pressure, not to exceed 1/175 of the glass edge length or ¾ inch, whichever is less per Building Code.

D. Glass Thickness: Where glass thickness is indicated, it is a minimum. Provide glass that complies with performance requirements and is not less than the thickness indicated.

E. Safety Glazing: Where safety glazing is indicated, provide glazing that complies with 16 CFR 1201, Category II.

F. Thermal and Optical Performance Properties: Provide glass with performance properties specified, as indicated in manufacturer's published test data, based on procedures indicated below:

1. U-Factors: Center-of-glazing values, according to NFRC 100 and based on LBL's WINDOW 5.2 computer program, expressed as Btu/sq. ft. x h x deg F (W/sq. m x K).

2. Solar Heat-Gain Coefficient (SHGC) and Visible Transmittance (VT): Center-of-glazing values, according to NFRC 200 and based on LBL's WINDOW 5.2 computer program.

3. Visible Reflectance: Center-of-glazing values, according to NFRC 300.

G. Values for thermal and optical performance properties are as specified in “INSULATING GLASS PRODUCTS SCHEDULE” article herein. Where local code requirements conflict, the most stringent requirements apply.

2.02 GLASS TYPES SUMMARY

A. GL-1: 1/4-inch-thick clear tempered safety glass.

B. GL-2: GL-1 with graffiti-resistant film applied to one or two sides as indicated.

C. GL-2A: GL-1 with graffiti-resistant film applied to exposed side and Specular polyester security film applied to interior side at platform signage panel locations.

D. GL-3: 1/2-inch-thick translucent laminated glass:

1. Sloped Glazing and Overhead Canopy Assemblies: White, 65 percent light transmittance.

E. GL-4: 1/2-inch-thick clear laminated glass.

F. GL-5: 1/4-inch-thick clear laminated glass:

1. Vertical Clerestory glazing 12 feet or greater above finished floor.

G. GL-6: Insulated glazing units 1-inch overall thickness.

H. GL-6A: Insulated glazing unit with UV bird-collision deterrent pattern on surface 1.

I. GL-7: GL-6 with graffiti-resistant film applied to one or two sides as indicated.

J. GL-8: Insulated Glazing Unit with bird-collision deterrent, ceramic frit, and anti-graffiti film applied where indicated.

2.03 MATERIALS

A. Thickness: 1/4 inch unless indicated otherwise.

B. Glass Color: Clear, unless otherwise indicated.

C. Strength:

1. Where fully tempered glass is indicated, provide Kind FT heat-treated float glass unless specified otherwise.

D. Comply with published recommendations of glass product manufacturers and organizations below unless more stringent requirements are indicated. See these publications for glazing terms not otherwise defined in this Section or in referenced standards:

1. AAMA Publications: AAMA GDSG-1, "Glass Design for Sloped Glazing," and AAMA TIR A7, "Sloped Glazing Guidelines."

2. IGMA Publication for Sloped Glazing: IGMA TB-3001, "Guidelines for Sloped Glazing."

3. IGMA Publication for Insulating Glass: SIGMA TM-3000, "North American Glazing Guidelines for Sealed Insulating Glass Units for Commercial and Residential Use."

2.04 GLASS PRODUCTS SCHEDULE

A. Float Glass: ASTM C1036, Type I, Quality-Q3, Class I (clear) unless otherwise indicated.

B. Tempered Glass: ASTM C1048; Type I; Quality-Q3; Class I (clear) unless otherwise indicated; of kind and condition indicated:

1. Fabrication Process: By horizontal (roller-hearth) process with roll-wave distortion parallel to bottom edge of glass as installed unless otherwise indicated.

2. For uncoated glass, comply with requirements for Condition A.

3. All tempered glass is to be heat soaked. Provide documentation that all tempered glass has been treated.

C. Laminated Glass:

1. ASTM C1172, kind and thickness as scheduled, Class 1 (clear):

a. Fully tempered: Kind LFT.

2. Interlayer Material: 0.06-inch polyvinyl butyryl:

a. Provide thickness not less than 0.06 for sloped glazing canopy assemblies:

1) Product: Ionoplast by DuPont Glass Laminating Solutions

b. Color: As indicated:

1) GL-3: Viracon “Arctic Snow” or approved equal.

2) GL-4, GL-5: Clear.

3. Laminating Process: Fabricate laminate glass using laminator’s standard heat- plus pressure process to produce glass free from foreign substances and air/glass pockets.

4. Construction:

a. GL-3, GL-4: 1/4-inch clear glass, interlayer, 1/4-inch clear glass.

b. GL-5: 1/8-inch clear glass, interlayer, 1/8-inch clear glass.

D. Insulating Glazing Units:

1. GL-6, GL-6A, GL-7: 2 layers clear ¼-inch tempered glass surrounding air space. Total thickness 1 inch. Low-E coating as required to meet performance requirements:

a. GL-6A: Where bird deterrence is indicated and surface 1 (exterior face) is outside of the touch zone: Provide UV bird-visible pattern complying with ABC, Prescriptive Rating Guidelines for Bird Friendly Materials on surface 1, Low-E coating on surface 2:

1) Basis of design: Pilkington AviSafe Suncool 70/35.

2) Pattern Complying with ABC Threat Factor <_ 12.

3) Overall reflectance of system including anti-graffiti film ≤ 15 percent.

b. Where both bird deterrence and anti-graffiti film are required by the Contract Documents refer to GL-8.

2. GL-8: 2 layers ¼-inch clear tempered glass surrounding air space with ceramic frit pattern on surface 2 complying with ABC, Prescriptive Rating Guidelines for Bird Friendly Materials; Low-E coating as required to meet performance requirements on surface 3 Total thickness 1 inch. Anti-graffiti film applied where indicated:

a. Pattern Complying with ABC Threat Factor <_ 30.

b. Overall reflectance of system including anti-graffiti film <= 15 percent.

c. Assembly Maximum U factor:

1) Fixed units: 0.38

2) Operable units: 0.40

3) Comply with locally adopted building codes where more stringent requirements apply.

d. Assembly Maximum Solar Heat Gain Coefficient (SHGC):

1) 0.40 at units.

2) Comply with locally adopted building codes where more stringent requirements apply.

e. Visual Light Transmittance: 1.1 times SHGC.

3. Bullet- Resistant Glazing:

a. Where indicated on the contract documents, provide bullet-resistant glazing tested and certified per UL 752 - Level 3.

b. Laminated non-splinter glass-clad polycarbonate.

c. Where the thickness of bullet-resistant glazing conflicts with the specified glazing construction, the thickness of the bullet-resistant construction shall govern.

d. Where used as part of an IGU and in aluminum-glazed curtain wall, or storefront systems. the entire system shall be rated per UL 752.

E. Standard Glazing Unit Dimensions: Provide glass units in the following sizes, applicable to the applications indicated:

1. Standard Glazing Unit Sizes for Canopy / Elevator shaft:

a. 23-1/2 by 47-1/2 inches.

b. 29-1/2 by 47-1/2 inches.

c. 47-1/2 by 47-1/2 inches.

d. 33-1/2 by 71-1/2 inches.

2. Standard Glazing Unit Sizes for Windscreen / Elevator Shaft Glazed Assemblies:

a. 33 by 47 inches.

b. 33 by 33 inches.

c. 47 by 47 inches.

2.05 GLAZING ACCESSORIES

A. Expanded Cellular Glazing Tapes: Closed-cell, PVC foam tapes; factory coated with adhesive on both surfaces; and complying with AAMA 800 for the following types:

1. AAMA 810.1, Type 1, for glazing applications in which tape acts as the primary sealant.

B. Sealants:

1. Structural Glazing Sealant: Comply with requirements for structural-sealant- glazed components, as stated elsewhere in the Contract Documents.

2. Use sealants that have a VOC content of 50 grams per liter or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

C. Cleaners, Primers, and Sealers: Types recommended by sealant or gasket manufacturer.

D. Setting Blocks: Neoprene, 80 to 90 Durometer shore A hardness; minimum 4 inches long, per GANA Glazing Manual.

E. Spacers: Elastomeric blocks or continuous extrusions with a Shore A durometer hardness required by glass manufacturer to maintain glass lites in place for installation indicated.

F. Shims: Provide aluminum shims as required for use beneath neoprene setting blocks to maintain proper alignment of space bar along sight line.

G. Edge Blocks: Elastomeric material of hardness needed to limit glass lateral movement (side walking).

H. Edge Protection: Provide continuous aluminum bar stock, size as indicated, with clear anodized finish, adhered to edge of glass with structural silicone sealant, to protect the interlayer of laminated glass from moisture.

2.06 GLAZING SURFACE FILMS

A. Comply with requirements for glazing surface films as stated in Section 08 87 00 - Glazing Surface Films.

2.07 FABRICATION OF GLAZING UNITS

A. Fabricate glazing units in standard sizes indicated. Where non-standard sizes are indicated, fabricate glazing units in sizes required to fit openings indicated:

1. Provide units with edge and face clearances, surface conditions, and bite complying with written instructions of product manufacturer and referenced glazing publications, to comply with system performance requirements.

B. Clean-cut or flat-grind vertical edges of butt-glazed monolithic lites to produce square edges with slight chamfers at junctions of edges and faces.

C. Exposed glass edges and corners: Grind smooth and polish.

D. Butt jointed glass panels: Grind smooth and polish glass edges.

2.08 SMOKE BAFFLE ASSEMBLIES

A. Description: Exposed aluminum soffit-mounted shoe with concealed vinyl cap rail for glass, concealed stainless steel bolt through glass and glazing grommets and gaskets. Include soffit anchors sized to support imposed loads. Shoe sized to glass thickness indicated.

B. Glass-to-Glass Joints: 1/2 wide, filled with CRL Water Clear Silicone Sealant.

C. Shoe Finish: Mill finish, unless otherwise indicated.

D. Basis of Design: CRL B5B Series Smoke Baffle by C.R. Laurence Architectural Products.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine framing, glazing channels, and stops, with Installer present, for compliance with the following:

1. Manufacturing and installation tolerances, including those for size, squareness, and offsets at corners.

2. Presence and functioning of weep systems.

3. Minimum required face and edge clearances.

4. Effective sealing between joints of glass-framing members.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

A. Clean glazing channels and other framing members receiving glass immediately before glazing. Remove coatings not firmly bonded to substrates.

B. Examine glazing units to locate exterior and interior surfaces. Label or mark units as needed so that exterior and interior surfaces are readily identifiable. Do not use materials that will leave visible marks in the completed work.

3.03 GLAZING, GENERAL

A. Comply with combined written instructions of manufacturers of glass, sealants, gaskets, and other glazing materials, unless more stringent requirements are indicated, including those in referenced glazing publications.

B. Protect glass edges from damage during handling and installation. Remove damaged glass from Contract site and legally dispose of off Contract site. Damaged glass is glass with edge damage or other imperfections that, when installed, could weaken glass and impair performance and appearance.

C. Install setting blocks in sill rabbets, sized and located to comply with referenced glazing publications, unless otherwise required by glass manufacturer. Set blocks in thin course of compatible sealant suitable for heel bead.

D. Provide spacers for glass lites where length plus width is larger than 50 inches:

1. Locate spacers directly opposite each other on both inside and outside faces of glass. Install correct size and spacing to preserve required face clearances, unless gaskets and glazing tapes are used that have demonstrated ability to maintain required face clearances and to comply with system performance requirements.

2. Provide 1/8-inch minimum bite of spacers on glass and use thickness equal to sealant width. With glazing tape, use thickness slightly less than final compressed thickness of tape.

E. Provide edge blocking where indicated or needed to prevent glass lites from moving sideways in glazing channel, as recommended in writing by glass manufacturer and according to requirements in referenced glazing publications.

F. Set glass lites in each series with uniform pattern, draw, bow, and similar characteristics.

3.04 TAPE GLAZING

A. Position tapes on fixed stops so that, when compressed by glass, their exposed edges are flush with or protrude slightly above sightline of stops.

B. Install tapes continuously, but not necessarily in one continuous length. Do not stretch tapes to make them fit opening.

C. Place joints in tapes at corners of opening with adjoining lengths butted together, not lapped. Seal joints in tapes with compatible sealant approved by tape manufacturer. Do not remove release paper from tape until right before each glazing unit is installed.

D. Apply heel bead of elastomeric sealant.

3.05 STRUCTURAL SILICONE GLAZING

A. Clean, prime and mask at structural silicone joints during the same work day on which the silicone is applied.

B. Temporarily clamp glass during cure of structural silicone. After sufficient cure, remove clamps and fill any gaps in silicone.

C. Mask glass and aluminum during application of structural silicone. Remove masking immediately after tooling sealant.

D. Seal exterior flush joints at structural silicone conditions with silicone sealant specified herein.

E. Do not apply structural silicone to edges of insulating glass units, or to edges of laminated glass units. Do not adhere to, or place against, the edge of laminated glass unit interlayer, sealants used as weather seals.

3.06 GRAFFITI RESISTANT FILM APPLICATION

A. Comply with requirements for water and graffiti repellents as stated elsewhere in the Contract Documents.

3.07 SMOKE BAFFLE INSTALLATION

A. Install in accordance with Shop Drawings and manufacturer’s written instructions.

B. Tool seal glass-to-glass joints and vertical perimeter joints with sealant to uniform profile.

3.08 CLEANING AND PROTECTION

A. Protect glass from contact with contaminating substances resulting from construction operations. If, despite such protection, contaminating substances do come into contact with glass, remove substances immediately as recommended in writing by glass manufacturer.

B. Remove and replace glass that is broken, chipped, cracked, or abraded or that is damaged from natural causes, accidents, and vandalism, during construction period.

C. Wash glass on both exposed surfaces in each area of Contract not more than four (4) days before date scheduled for inspections that establish date of Acceptance. Wash glass as recommended in writing by glass manufacturer.

END OF SECTION

SECTION 08 87 00

GLAZING SURFACE FILMS

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for surface preparation and application of the following:

a. Graffiti-resistant films:

1) New glazing: factory or shop-applied to glazing before installation in frames.

2) Field-Applied to existing glazing assemblies.

b. Privacy Film.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. American National Standards Institute (ANSI):

a. ANSI Z97.1 - American National Standard for Safety Glazing Materials Used in Buildings - Safety Performance Specifications and Methods of Test.

2. American Society for Testing and Materials International (ASTM):

a. ASTM D1044 - Standard Method of Test for Resistance of Transparent Plastics to Surface Abrasion (Taber Abrader Test).

b. ASTM E84 - Standard Method of Test for Surface Burning Characteristics of Building Materials.

1.03 SUBMITTALS

A. Product Data: Manufacturer's data sheets on each product to be used, including:

1. Preparation instructions and recommendations.

2. Storage and handling requirements and recommendations.

3. Installation methods.

B. LEED Submittals:

1. Where LEED certification is required by the project, submit the same documentation for approval as required by GBCI as a project submittal. Highlight the relevant LEED information.

2. LEED documentation is to be submitted separately and titled LEED SUBMITTAL.

3. Building Product Disclosure and Optimization credit data: Submit data to support the LEED SUBMITTAL.

C. Samples: Provide graffiti-resistant film samples as part of Submittals requirements specified in glazing as stated elsewhere in the Contract Documents.

D. Shop Drawings: Detail installation of film, anchoring accessories, and sealant. Indicate type and location for each type of film to be installed.

E. Manufacturer’s Installation Instructions: Indicate special procedures and conditions requiring special attention; cautionary procedures required during application.

F. Test sample, and field inspection reports.

G. Installer Qualification Data: From manufacturer, indicating Applicator complies with requirements.

H. Maintenance Data: Graffiti removal and cleaning instructions, written and video or digital medium showing cleaning procedure, including recommended proprietary products.

1.04 QUALITY ASSURANCE

A. Source Limitations: Obtain all surface film materials through one (1) source from a single manufacturer. Provide secondary materials as cleaners recommended by manufacturer of primary materials.

B. Graffiti-Resistant Plastic Film Installer Qualifications:

1. Single Installer with a minimum of 5 years demonstrated experience in installing products of the same type and scope as specified, as well as trained and approve by the manufacturer for products indicated:

a. Provide a commercial building reference list of five (5) properties where the installer has applied window film. Include the following Information:

1) Name of Building.

2) The name and telephone number of a management contact.

3) Type of glass.

4) Type of film.

5) Account of film installed.

6) Date of completion

2. Mock-Up:

a. Provide mock-up of films with glazing mock-ups as directed in 08 80 00.

1.05 EXTRA MATERIALS

A. Maintenance Materials: Provide extra materials for Owner’s maintenance. Materials shall be same quality, model and manufacture as specified materials, in sealed unopened. Containers, with shelf life indicated and instructions for use. Verify quantities with Resident Engineer before delivery:

1. Graffiti-Resistant Film for Glass: Ten percent of quantity installed.

2. Security and Safety film: Ten percent of quantity installed.

3. Privacy Film: Ten percent of quantity installed.

1.06 PROJECT CONDITIONS

A. Maintain environmental conditions (temperature, humidity, and ventilation) within limits recommended by manufacturer for optimum results. Do not install products under environmental conditions outside manufacturer's absolute limits.

B. Weather and Substrate Conditions: Do not proceed with application of film when the following conditions exist, unless otherwise indicated in manufacturer’s written instructions:

1. Ambient temperature is less than 40 degrees Fahrenheit or above 100 degrees Fahrenheit.

2. When rain or temperatures below 40 degrees Fahrenheit are predicted for a period of 24 hours, or earlier than three (3) days after surfaces become wet from rainfall or other moisture sources.

3. When substrate is frozen, or at surface temperature of less than 40 degrees Fahrenheit.

4. When winds are sufficient to carry airborne chemicals to unprotected surfaces or adjacent properties or would cause an improper application rate.

1.07 WARRANTY

A. At project closeout, provide to Contracting Agency an executed current copy of the manufacturer's standard limited warranty against manufacturing defect, outlining its terms, conditions, and exclusions from coverage.

B. Anti-graffiti films are warranted for a period of 1 year when installed outdoors and for a period of 10 years when installed indoors.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. Flammability: Surface burning characteristics when tested in accordance ASTM E84:

1. Flame Spread Index: 25 maximum.

2. Smoke Developed Index: 450 maximum.

B. Abrasion Resistance: Film must have a surface coating that is resistant to abrasion such that, less than 5 percent increase of transmitted light haze will result in accordance with ASTM D 1044 using 50 cycles, 500 grams weight, and the CS10F Calibrase Wheel.

C. Safety/Security Film Impact Performance:

1. Meets ANSI Z97.1 Class B and 16 CFR 1201 Category I 150 ft-lbs. impact resistance.

D. Meets accelerated weathering requirements in accordance with ANSI Z97.1.

2.02 MATERIALS

A. Compatibility: Repellent and coating materials shall be compatible with substrate surfaces and other materials they are in contact with.

B. Maximum VOC Content: Comply with referenced Washington State Air Quality Rules and Laws.

2.03 SACRIFICIAL GRAFFITI-RESISTANT FILM FOR GLASS

A. Description: Graffiti resistant film applied to all exposed glass surfaces in the Touch Zone. Refer to Sound Transit Requirements Manual for definition of Touch Zone:

1. Sacrificial coating composed of three layers of 2-mil polyester (PET) laminated together.

2. Optically-clear and distortion-free coating, which when applied, provides a significant resistance to etching and scratching of underlying surface.

B. Acceptable Product:

1. Vandal Shield, Graffiti Removals, Inc., “VS-1200”.

2. 3M, “Anti-Graffiti 6.”

2.04 ACCESSORIES

A. As recommended or required by film manufacturer.

B. Glass Cleaner: As recommended by film manufacturer.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Verify existing conditions before starting work, including:

1. Surfaces to be coated are dry, clean, and free of efflorescence, oil, or other material detrimental to performance of work.

B. Inspect surfaces in presence of repellent manufacturer's authorized technical representative and Applicator.

C. Do not proceed with treatment application until unsatisfactory conditions have been corrected.

3.02 GRAFFITI-RESISTANT FILM APPLICATION

A. Shop-Applied for New Glazing:

1. Apply film per manufacturer’s instructions in shop, prior to installation in frames.

2. Allow sufficient time in schedule for film to cure prior to installation or transportation to site.

B. Field - Applied Film for Existing Glazing:

1. Preparation:

a. Clean glass of dust, dirt, paint, oil, grease, mildew, mold, and other contaminants that would inhibit adhesion.

b. Immediately prior to applying film, thoroughly wash glass with neutral cleaning solution.

c. Protect adjacent surfaces.

d. Do not begin installation until substrates have been properly prepared.

e. Prepare surfaces using the methods recommended by the manufacturer for achieving the best result for the substrate under the project conditions.

2. Installation:

a. Install film in accordance with manufacturer's instructions, without air bubbles, wrinkles, seams, pinholes, or gaps, as required to achieve specified performance.

b. Cut film edges neatly and square at a uniform distance of 1/8 inch to 1/16 inch of window sealant. Use new blade tips after three to four cuts.

c. Spray the slip solution, composed of one capful of baby shampoo or dishwashing liquid to one gallon of water, on window glass and adhesive to facilitate proper positioning of film.

d. Apply film to glass and lightly spray film with slip solution.

e. Squeegee from top to bottom of window. Spray slip solution to film and squeegee a second time.

f. Bump film edge with lint-free towel wrapped around edge of a five-way tool.

3. Post-Application:

a. Upon completion of film application, allow 30 days for moisture from film installation to dry thoroughly, and to allow film to dry flat with no moisture dimples when viewed under normal viewing conditions.

b. After application of film, wash film using common window cleaning solutions, including ammonia solutions, 30 days after application. Do not use abrasive type cleaning agents and bristle brushes to avoid scratching film. Use synthetic sponges or soft cloths.

3.03 PROTECTION OF FINISHED WORK

A. Protect treated surfaces from scuffing, abrasion and marring from adjacent work.

B. Replace damaged products before Date of Acceptance.

C. Remove labels and protective covers at completion of project.

3.04 SCHEDULE OF APPLICATIONS

A. Anti-Graffiti Films:

1. Apply to glass surfaces within 8 feet of finish floor or grade where surfaces are accessible to general public (touch zone).

2. When height of glass surface exceeds 8 feet, extend film material to top of the next horizontal mullion.

B. Privacy Film:

1. Apply to interior (secure) surfaced of glazing within 8 feet of finish floor which provides a view into security offices, employee areas, as indicated on the Issued for Construction Drawings.

2. When height of glass surface exceeds 8 feet, extend film material to top of the next horizontal mullion.

END OF SECTION

SECTION 08 91 00

LOUVERS

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for the following:

a. Fixed metal louvers, frames, and accessories for wall openings and screen assemblies.

b. Combination fixed and operable metal louvers.

c. Blank-off panels for wall louvers.

d. Insect screens.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents.

1. Air Movement and Control Association International, Inc. (AMCA):

a. AMCA 500-D - Laboratory Methods of Testing Dampers for Rating.

b. AMCA 500-L - Laboratory Methods of Testing Louvers for Rating.

c. AMCA 511 - Certified Program Product Rating Manual for Air Control Devices.

2. American Society for Testing and Materials International (ASTM):

a. ASTM B221 - Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes.

b. ASTM D1187/D1187M - Standard Specification for Asphalt-Base Emulsions for Use as Protective Coatings for Metal.

c. ASTM E488/E488M - Standard Test Methods for Strength of Anchors in Concrete Elements.

1.03 COORDINATION

A. Coordinate the work of this Section with the work of interfacing systems and materials including, but not limited to:

1. Cladding or masonry joint dimensions, joint alignment layouts, finishes, and attachment details.

2. Sheet metal flashings associated with wall panel and louver systems.

3. Mechanical systems such as HVAC, utilizing louvers for exhaust or intake, for coordination of blank-off panel sizes and locations.

4. Electrical services to motorized devices.

5. Metal stud framing, for coordination of partition wall locations with blank-off panels.

1.04 SUBMITTALS

A. Submit:

1. Shop Drawings: Indicate louver layout plan and elevations, opening and clearance dimensions, tolerances; head, jamb and sill details; blade configuration, screens, blanked out areas required, and frames, and coordinated flashings and sealants for continuity of building envelope.

2. Coordination Drawings: Provide exterior elevations, drawn to scale, on which the following elements shown and coordinated with each other.

3. Product Data: Provide data describing design characteristics, maximum recommended air velocity, design free area, materials and finishes:

a. Clearly illustrate elements, including attachment and bracing members, methods employed to assure performance integrity of the exterior enclosure system, and the component's relationship to surrounding work, including dimensional tolerances and bench mark locations to be met.

b. Show weep paths, gaskets, flashing, sealant, and other means of preventing water intrusion.

c. Wiring Diagrams: For power, signal, and control wiring for motorized operable louvers.

d. Coordinate and submit shop drawings with the following work as stated elsewhere in the Contract Documents:

1) Sheet metal flashing and trim.

2) Glazed aluminum-framed storefronts and curtain walls.

e. Metal wall panels.

f. Louvers.

g. Exterior openings including doors and windows.

h. Sun shading devices.

i. Light fixtures.

j. Penetrations of walls by pipes and utilities.

4. LEED Submittals:

a. Where LEED certification is required by the project, submit the same documentation for approval as required by GBCI as a project submittal. Highlight the relevant LEED information.

b. LEED documentation is to be submitted separately and titled LEED SUBMITTAL.

c. Building Product Disclosure and Optimization credit data: Submit data to support the LEED SUBMITTAL.

5. Samples: Submit two samples 6-inches by 6-inches in size illustrating finish of exterior and interior surfaces.

6. Test Reports: Independent Testing Laboratory reports showing compliance with specified performance criteria.

7. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

8. Maintenance Data: Include lubrication schedules, and adjustment requirements.

9. Mockup: As specified in “Quality Assurance” Article herein

1.05 QUALITY ASSURANCE

A. Single Source Responsibility: Provide louvers from a single source.

B. Manufacturer Qualifications: Company specializing in manufacturing products of the type specified in this Section, with minimum three (3) years of documented experience.

C. AMCA Seal: Mark units with AMCA Certified Ratings Seal.

D. Mockups: Build mockups to verify to demonstrate aesthetic effects of louvers, integration with surrounding wall finish or cladding system, and set quality standards for fabrication and installation:

1. Build mockup of typical louver, surrounded on all sides by wall finish system. Include typical flashings and trim.

2. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.

3. Mock-up, if approved by Resident Engineer, may remain as part of the Work if undisturbed at time of Substantial Completion.

1.06 PROJECT CONDITIONS

A. Field Measurements: Check actual louver openings by accurate field measurements before fabrication; show recorded measurements on final shop drawings. Coordinate fabrication schedule with construction progress to avoid delay of the Work. Where field measurements cannot be made without delaying the Work, guarantee opening dimensions and proceed with fabrication of louvers without field measurements. Coordinate wall construction to ensure that actual opening dimensions correspond to guaranteed dimensions.

B. Weather Limitations: Proceed with installation only when existing and forecasted weather conditions permit assembly of louvers to be performed according to manufacturers' written instructions and warranty requirements.

1.07 WARRANTY

A. Special Warranty on Panel Finishes: Manufacturer's standard form in which manufacturer agrees to repair finish or replace louvers that show evidence of deterioration of factory- applied finishes within specified warranty period:

1. Exposed Panel Finish: Deterioration includes, but is not limited to, the following:

    a. Color fading more than 5 Hunter units when tested according to ASTM D2244.

    b. Chalking in excess of a No. 8 rating when tested according to ASTM D4214.

    c. Cracking, checking, peeling, or failure of paint to adhere to bare metal.

2. Finish Warranty Period: 20 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. AMCA Certified: In accordance with AMCA 511.

B. Structural Performance: Design, engineer, fabricate, and install exterior metal wall louvers to withstand the effects of loads and stresses from wind and normal thermal movement, without evidencing permanent deformation of louver components including blades, frames, and supports; noise or metal fatigue caused by louver blade rattle or flutter; and permanent damage to fastener and anchors:

    1. Wind Load: Uniform pressures (velocity pressures) indicated on Issued for Construction Drawings, acting inwards or outwards.

    2. Deflection Limits: For wind loads, no greater than L/240 of the span.

    3. Louver Analysis: Provide louver calculations to verify louver will withstand design wind loads indicated without detrimental effects or deflection:

        a. Include effects of thermal differential between the exterior and interior facings and resistance to fastener pullout.

C. Louver Performance Ratings: Provide louvers complying with requirements specified, as demonstrated by testing manufacturer's stock units identical to those provided, except for length and width according to AMCA 500-L.

D. Seismic Performance: Louvers, including attachments to other construction, shall withstand the effects of earthquake motions determined according to applicable code.

E. Thermal Movements: Normal thermal movement is defined as that resulting from the following maximum change (range) in ambient temperature. Base design calculations on actual surface temperatures of metals due to both solar heat gain and night time sky heat loss:

    1. Temperature Change (range): 120 deg F, ambient; 180 deg F, material surfaces 100 degrees Fahrenheit.

F. Air Performance, Water Penetration, and Air Leakage Ratings: Provide louvers complying with performance requirements indicated as demonstrated by testing manufacturers stock units, of height and width indicated, according to AMCA 500-D.

G. UL and NEMA Compliance: Provide motors and related components for motor-operated louvers that are listed and labeled by UL and comply with applicable NEMA standards.

H. Building Envelope Testing:

    1. As indicated in Section 01 81 13 - Sustainable Design Requirements, Section 01 91 13 - General Commissioning Requirements, and the “Project Commissioning Plan.”

2.02 MATERIALS

A. Aluminum Extrusions: ASTM B221, Alloy 6063-T5, T-52, or T6.

B. Fasteners: Use types and sizes to suit unit installation conditions:

1. Use Phillips flat-head screws for exposed fasteners unless otherwise indicated.

2. For fastening aluminum, use aluminum or 300 series stainless-steel fasteners.

3. For fastening stainless steel, use 300 series stainless-steel fasteners.

C. Fasteners for Concrete and Masonry: Torque-controlled expansion anchors, made from stainless-steel components, with capability to sustain, without failure, a load equal to four times the loads imposed, for concrete, or six times the load imposed, for masonry, as determined by testing in accordance with ASTM E488/E488M, conducted by a qualified Independent Testing Laboratory:

1. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D1187/D1187M.

2.03 FIXED, EXTRUDED-ALUMINUM LOUVERS

A. Horizontal, Continuous-Line, Drainable-Blade Louver for Wall Openings: Drainable-blade louver with blade gutters (drains) capable of collecting and draining water from blades:

1. Basis-of-Design Product: Subject to compliance with requirements, provide Airolite K6774 by The Airolite Company, LLC, or equivalent product by one of the following:

a. Construction Specialties, Inc.

b. Ruskin Company; Tomkins PLC.

c. United Enertech Corp.

d. Greenheck.

2. Louver Depth: as shown.

3. Frame and Blade Nominal Thickness: Not less than 0.081 inch.

4. Prefabricated Sills, Coping or Caps and Jambs: Manufacturer’s aluminum extrusions designed for application, finished to match louvers.

5. Insect Screen: As specified.

6. Louver Performance Ratings:

a. Free Area: Not less than 8.35 square feet for 48-inch-wide by 48-inch- high louver.

b. Point of Beginning Water Penetration: Not less than 1075 feet per minute.

c. Air Performance: Not more than 01.16-inch w.g. static pressure drop at point of beginning water penetration intake velocity.

7. Finish: Fluoropolymer coating.

2.04 COMBINATION FIXED/OPERABLE, EXTRUDED-ALUMINUM LOUVERS

A. Horizontal, Combination Louver/Damper, Drainable-Blade Louver, Concealed Actuator: Drainable fixed blades and head member, rear operable blades, and actuator in sill enclosure. Blade gutters (drains) in blades capable of collecting and draining water from blades:

1. Basis-of-Design Product: Subject to compliance with requirements, provide Greenheck EACC-401, or equivalent product by one of the following:

a. Airolite Company, LLC (The).

b. Construction Specialties, Inc.

c. Ruskin Company; Tomkins PLC.

d. United Enertech Corp.

2. Louver Depth: as shown.

3. Frame Nominal Thickness: Not less than 0.125-inch thickness.

4. Blade Nominal Thickness: Not less than 0.081-inch thickness.

5. Prefabricated Sills, Coping or Caps and Jambs: Manufacturer’s aluminum extrusions designed for application, finished to match louvers.

6. Seals: Dual-durometer extruded vinyl blade seals; compressible stainless steel jamb seals.

7. Insect Screen: As specified.

8. Louver Performance Ratings:

a. Free Area: As indicated in Contract Documents.

b. Point of Beginning Water Penetration: Not less than 1192 feet per minute.

c. Air Performance: Not less than acceptable velocities for application, occurring at point of beginning water penetration intake velocity.

9. Louver Operation: Provide operable louvers with operating mechanisms to suit louver sizes, and as follows:

a. Motor operation with 110-V, 60-Hz motor and limit switch. Include remote-mounted switches, indicator lights, and terminals for controlling devices.

b. Operator Type: Architect of Record will select from one of the following:

1) Two-position, spring-return application.

2) Two-direction.

10. Finish: Fluoropolymer coating.

2.05 FIXED, EXTRUDED-ALUMINUM LOUVERS FOR SCREEN ASSEMBLIES

A. See drawing elevations for numbering of panels: Horizontal Louver Assembly for Screen Applications: Drainable-blade louver with blade gutters (drains) capable of collecting and draining water from blades:

1. Basis-of-Design Product: Subject to compliance with requirements, provide Airolite SCB601 by The Airolite Company, LLC, or equivalent product by one of the following:

   a. Construction Specialties, Inc.

   b. Ruskin Company; Tomkins PLC.

   c. United Enertech Corp.

2. Product: Mullions visible.

3. Insect Screening: Not required.

4. Blank-Off Panels: Per below and where indicated.

5. Removable Sections: Provide sections of louvers indicated removable for maintenance access. Design devices and fastenings concealed from view, and acceptable to Architect of Record.

6. Finish: Fluoropolymer coating.

2.06 INSECT SCREENS

A. General: Provide insect screen at each exterior louver:

   1. Screen Location: Interior face.

   2. Screening Type: Insect screening.

B. Secure screen frames to louver frames with stainless-steel machine screws, spaced a maximum of 6 inches from each corner and at 12 inches on center.

C. Louver Screen Frames: Fabricate with mitered corners to louver sizes indicated:

   1. Metal: Same kind and form of metal as indicated for louver to which screens are attached.

   2. Finish: Mill finish unless otherwise indicated.

   3. Type: Non-rewireable, U-shaped frames.

D. Insect Screening Material: Aluminum, 18 x 16 aluminum mesh 0.011 INCH (0.279mm) diameter wire insect screens secured within 0.055 INCH (1.40mm) thick extruded aluminum frames. Frames to have mitered corners and corner locks.

2.07 BLANK-OFF PANELS

A. Insulated Blank-Off Panels: UNO 2 inch laminated panels consisting of an insulating core surfaced on back and front with metal sheets and factory-attached to back of louver:

   1. Material: Match louver material, painted black on exterior side; provide where duct connected to louver is smaller than louver frame, sealing off louver area outside duct.

   2. Insulating Core: Mineral wool, R-value = 4 per inch.

   3. Edge Treatment: Trim perimeter edges of blank-off panels with louver manufacturer's standard channel frames, with corners mitered and with same finish as panels.

   4. Seal perimeter joints between panel faces and louver frames with gaskets or sealant.

5. Panel Finish: Same type of finish applied to louvers, but black color on exterior face.

B. Blank-Off Panels: 0.050 inch aluminum sheet and attached to back of louver:

1. Material: Match louver material, painted black on exterior side; provide where duct connected to louver is smaller than louver frame, sealing off louver area outside duct.

2. Edge Treatment: Trim perimeter edges of blank-off panels with louver manufacturer's standard channel frames, with corners mitered and with same finish as panels.

3. Seal perimeter joints between panel faces and louver frames with gaskets or sealant.

4. Panel Finish: Same type of finish applied to louvers, but black color on exterior face.

2.08 FABRICATION

A. Assemble louvers in factory to minimize field splicing and assembly. Disassemble units as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.

B. Vertical Assemblies: Where height of louver units exceeds fabrication and handling limitations, fabricate units to permit field-bolted assembly with close-fitting joints in jambs and mullions, reinforced with splice plates:

1. Continuous Vertical Assemblies: Fabricate units without interrupting blade- spacing pattern.

C. Maintain equal louver blade spacing, including separation between blades and frames at head and sill, to produce uniform appearance.

D. Fabricate frames, including integral sills, to fit in openings of sizes indicated, with allowances made for fabrication and installation tolerances, adjoining material tolerances, and perimeter sealant joints:

1. Frame Type: Channel unless otherwise indicated.

E. Include supports, anchorages, and accessories required for complete assembly.

F. Provide vertical mullions of type and at spacings indicated, but not more than recommended by manufacturer, or 72 inches on center, whichever is less.

1. Fully Recessed Mullions: Where indicated, provide mullions fully recessed behind louver blades. Where length of louver exceeds fabrication and handling limitations, fabricate with close-fitting blade splices designed to permit expansion and contraction.

2. Semi-recessed Mullions: Where indicated, provide mullions partly recessed behind louver blades so louver blades appear continuous. Where length of louver exceeds fabrication and handling limitations, fabricate with interlocking split mullions and close-fitting blade splices designed to permit expansion and contraction.

G. Provide subsills made of same material as louvers or extended sills for recessed louvers.

H. Join frame members to each other and to fixed louver blades with fillet welds, threaded fasteners, or both, as standard with louver manufacturer unless otherwise indicated or size of louver assembly makes bolted connections between frame members necessary.

2.09 ALUMINUM FINISHES

A. Exposed Fluoropolymer Coating Finish: Fluoropolymer Coating System FL-2 as stated elsewhere in the Contract Documents.

B. Concealed Aluminum: Manufacturer’s standard.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine substrates and openings, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Verify that prepared openings and flashings are ready to receive work and opening dimensions are as indicated on shop drawings.

C. Verify that field measurements are as indicated.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

A. Coordinate shop drawings, diagrams, templates, instructions, and directions for installation of anchorages to be embedded in concrete or masonry construction, and post-installed anchors and fasteners in concrete and framed walls. Coordinate delivery of such items to avoid construction delay.

B. Ensure rough openings are prepped with building envelope components required such as Weather-resistive barriers, liquid-applied flashings, sill flashings and vapor barriers.

3.03 INSTALLATION

A. Install louver assembly in accordance with manufacturer's instructions.

B. Install louvers level, plumb, and at indicated alignment with adjacent work.

C. Install flashings and align louver assembly to ensure moisture shed from flashings and diversion of moisture to exterior.

D. Secure louver frames in openings with concealed fasteners. Provide ethylene propylene diene M-class rubber (EPDM) or Neoprene washers fitted to screws where required to protect metal surfaces and to make a weather-tight connection.

E. Form closely fitted joints with exposed connections accurately located and secured.

F. Provide perimeter reveals and openings of uniform width for sealants and joint fillers, as indicated. Install concealed gaskets, flashings, joint fillers and insulation as louver installation progresses where required to make louver joints weather-tight. Install perimeter sealant and backing rod as stated elsewhere in the Contract Documents.

G. Protect unpainted galvanized and nonferrous-metal surfaces that are in contact with concrete, masonry, or dissimilar metals from corrosion and galvanic action by separating surfaces with isolation pads. Use heavy coat of bituminous paint only when permitted by Architect of Record.

H. Provide waterproof connection between ductwork, louver screen and louver, and provide positive water drainage to exterior of building.

I. Repair finishes damaged by cutting, welding, soldering, and grinding operations. Restore finishes to that no evidence of corrective work remains. Return items which cannot be refinished in field to shop, and make required alterations and refinish entire unit, or provide new units.

3.04 ADJUSTING AND CLEANING

A. Test operable louvers and adjust as needed to produce fully functioning units that comply with requirements.

B. Clean exposed surfaces of louvers and vents that are not protected by temporary covering, to remove fingerprints and soil during construction period. Do not let soil accumulate during construction period.

C. Before final inspection, clean exposed surfaces with water and a mild soap or detergent not harmful to finishes. Thoroughly rinse surfaces and dry.

D. Restore louvers and vents damaged during installation and construction so no evidence remains of corrective work. If results of restoration are unsuccessful, as determined by Resident Engineer, remove damaged units and replace with new units:

1. Touch up minor abrasions in finishes with air-dried coating that matches color and gloss of, and is compatible with, factory-applied finish coating.

END OF SECTION

SECTION 09 21 16

GYPSUM BOARD ASSEMBLIES

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for the following:

a. Metal stud wall framing for gwb assemblies.

b. Metal channel ceiling framing for gwb ceilings.

c. Shaft wall system.

d. Fire-rated wall and ceiling assemblies.

e. Gypsum wallboard.

f. Gypsum Sheathing

g. Cementitious backer board.

h. Joint treatment and accessories.

i. Acoustic insulation and sealant.

j. Delegated design of framing systems.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. American National Standards Institute (ANSI):

a. ANSI A108.11 - American National Standard Specifications for Interior Installation of Cementitious Backer Units.

b. ANSI A118.9 - American National Standard Test Methods and Specifications for Cementitious Backer Board.

2. American Society for Testing and Materials International (ASTM):

a. ASTM A653 - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.

b. ASTM A568/A568M - Standard Specification for Steel, Sheet, Carbon, Structural, and High-Strength, Low-Alloy, Hot-Rolled and Cold-Rolled, General Requirements.

c. ASTM B221 - Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes.

d. ASTM C475/C475M - Standard Specification for Joint Compound and Joint Tape for Finishing Gypsum Board.

e. ASTM C645 - Standard Specification for Nonstructural Steel Framing Members.

f. ASTM C665-12 Standard Specification for Mineral-Fiber Blanket Thermal Insulation for Light Frame Construction.

g. ASTM C754 - Standard Specification for Installation of Steel Framing Members to Receive Screw-Attached Gypsum Panel Products.

h. ASTM C840 - Standard Specification for Application and Finishing of Gypsum Board.

i. ASTM C919 Standard Practice for Use of Sealants in Acoustical Applications.

j. ASTM C1002 - Standard Specification for Steel Self-Piercing Tapping Screws for the Application of Gypsum Panel Products or Metal Plaster Bases to Wood Studs or Steel Studs.

k. ASTM C1047 - Standard Specification for Accessories for Gypsum Wallboard and Gypsum Veneer Base.

l. ASTM C1177/C1177M - Standard Specification for Glass Mat Gypsum Substrate for Use as Sheathing.

m. ASTM C1396/C1396M - Standard Specification for Gypsum Board.

n. ASTM C1658/C1658M – Standard Specification for Glass Mat Gypsum Panels.

o. ASTM D3273 - Standard Test Method for Resistance to Growth of Mold on the Surface of Interior Coatings in an Environmental Chamber.

p. ASTM E72 - Standard Test Methods of Conducting Strength Tests of Panels for Building Construction.

q. ASTM E119 - Standard Test Methods for Fire Tests of Building Construction and Materials.

r. ASTM E488 - Standard Test Methods for Strength of Anchors in Concrete Elements.

s. ASTM E1190 - Standard Test Methods for Strength of Power-Actuated Fasteners Installed in Structural Members.

3. Gypsum Association (GA):

a. GA-214 – Recommended Levels of Gypsum Board Finish.

b. GA-216 - Application and Finishing of Gypsum Panel Products.

c. GA-219 - Frame Opening Details.

d. GA-226 - Application of Gypsum Board to Form Curved Surfaces.

e. GA-600 - Fire Resistance Design Manual.

1.03 SUBMITTALS

A. Submit:

1. Shop Drawings: Indicate special details associated with fireproofing, acoustic seals, and other unique details. Show size, gauge, and spacing of studs used to comply with specified requirements for steel framing and show all control joints as indicated or required in accordance with ASTM C840.

2. Product Data: Provide data on metal framing, gypsum board, accessories, and joint finishing system. Include all fire rated assembly test pages.

3. Engineering: for Delegated-Design Submittals include analysis data signed and sealed by the qualified professional engineer responsible for their preparation. Provide manufacturer’s data on partition head to structure connectors, showing compliance with requirements. Provie ICC reports on all fasteners.

4. Provide manufacturer's data or engineering calculations on spans, deflection, attachment methods, and bracing, and indicate compliance with code. Product Data: Provide manufacturer's data on partition head to structure connectors, showing compliance with requirements.

5. LEED Submittals:

a. Where LEED certification is required by the project, submit the same documentation for approval as required by GBCI as a project submittal. Highlight the relevant LEED information.

b. LEED documentation is to be submitted separately and titled LEED SUBMITTAL.

c. Building Product Disclosure and Optimization credit data: Submit data to support the LEED SUBMITTAL.

B. Transmit:

1. Test Reports: For all stud framing products that do not comply with ASTM C 645 or C 754, provide independent laboratory reports showing maximum stud heights at required spacing and deflections.

1.04 QUALITY ASSURANCE

A. Single Source Responsibility for Panel Products: Obtain each type of gypsum board and other panel products from a single manufacturer.

B. Single Source Responsibility for Finishing Materials: Obtain finishing materials from the same manufacturer that supplies gypsum board and other panel products.

C. Perform all work of this Section in accordance with ASTM C 840.

D. Applicator Qualifications: Company specializing in performing gypsum board application and finishing, with minimum three years of documented experience.

E. Mock-Up:

1. In advance of the drywall work, construct mock-up of gypsum panel wall/ceiling assemblies to establish finished appearance expectations of the selected finishing and paint system:

a. Locate mock-up(s) as directed by Resident Engineer for representative conditions of a level 3, 4, and 5 finish.

b. Apply paint finishes as specified in Section 09 90 00 -0 Painting and Coatings.

2. The mock-up must be representative of the actual project wall and ceiling configuration(s) and finished lighting to be used in the building.

3. Include examples of finished horizontal and vertical panel joints, wall to ceiling transition condition, control joints, edge conditions at window or door frame, and embedded items such as lighting and wall penetrations such as pipe or conduit.

4. Maintain accepted mock-ups for the duration of construction as the standard for expected quality of work.

5. Accepted mock-ups may remain as part of the completed work if undisturbed at time of substantial completion.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Delivery, identification, storage and handling shall be in accordance with the requirements of ASTM C754.

B. Deliver materials in original packages, containers, or bundles bearing brand name and identification of manufacturer or supplier.

C. Store materials inside under cover and keep them dry and protected against damage from weather, direct sunlight, surface contamination, corrosion, construction traffic, and other causes. Neatly stack gypsum panels flat to prevent sagging.

D. Handle gypsum board to prevent damage to edges, ends, and surfaces. Do not bend or otherwise damage metal corner beads and trim.

1.06 PROJECT CONDITIONS

A. Environmental Conditions, General: Establish and maintain environmental conditions for applying and finishing gypsum board to comply with ASTM C 840 and with gypsum board manufacturer’s recommendations.

B. Ventilation: Ventilate building spaces, to the extent required, for drying joint treatment materials. Avoid drafts during hot dry weather to prevent finishing materials from drying too rapidly.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. Completed assemblies to comply with ASTM C840 and GA-216.

B. Fire Test Response Characteristics: Where fire-rated gypsum board assemblies are indicated, provide materials and construction identical to those of assemblies tested for fire resistance in accordance with ASTM E 119 by an Independent Testing Laboratory agency acceptable to the authorities having jurisdiction.

C. Fire Resistance Ratings: As indicated by reference to GA file numbers in GA-600 "Fire Resistance Design Manual" or to design designations in UL "Fire Resistance Directory" or in the listing of another Independent Testing Laboratory acceptable to authorities having jurisdiction:

1. Regulatory Requirements:

   a. Conform to applicable code for fire-rated assemblies as follows:

      1) Fire-Rated Partitions: Listed assembly by UL or GA with required hour ratings as indicated on Drawings.

      2) Head of Fire-Rated Partitions: Listed assembly by UL or GA with required hour ratings as indicated on Drawings.

2.02 MANUFACTURERS

A. Glass Mat Gypsum Board, Gypsum Sheathing; Moisture-Resistant Sheathing:

   1. Georgia-Pacific Gypsum Corporation.

   2. National Gypsum Company.

   3. United States Gypsum Company.

   4. CertainTeed.

   5. Manufacturers not otherwise listed, subject to compliance with requirements as required by proprietary fire-rated or acoustical assemblies as indicated on the contract documents.

B. Cementitious Backer Board:

   1. Custom Building Products.

   2. James Hardie.

   3. United States Gypsum Company.

C. Metal Support Systems:

   1. Scafco.

   2. Cemco.

   3. ClarkDietrich.

   4. Manufacturers not otherwise listed, subject to compliance with requirements as required by proprietary fire-rated or acoustical assemblies as indicated on the contract documents.

2.03 MATERIALS

A. Metal Framing:

   1. General: Provide steel framing members complying with the following minimum requirements:

      a. Performance Requirements: Select steel studs and all other members in accordance with the manufacturer’s standard load tables and following design pressures and deflections:

         1) At all partitions: 1/360 at 10 pounds per square foot.

2) At suspended and furred ceilings: 1/240 per 10 pounds per square foot.

b. Protective Coating: G40 hot-dip galvanized coating in accordance with ASTM A653.

2. Non-Loadbearing Framing System Components: ASTM C645; galvanized sheet steel, of size and properties necessary to comply with ASTM C754 for the conditions indicated.

a. Exception: The minimum metal thickness and section properties requirements of ASTM C645 are waived provided steel of 40,000 pounds per square inch minimum yield strength is used, the metal is continuously dimpled, the effective thickness is at least twice the base metal thickness, and maximum stud heights are determined by testing in accordance with ASTM E72 using assemblies specified by ASTM C754.

b. Steel Studs and Runners: ASTM C645, with flange edges of studs bent back 90 degrees and doubled over to form 3/16-inch-wide minimum lip (return) and complying with the following requirements for minimum thickness of base (uncoated) metal and for depth:

1) Thickness: As required to comply with performance requirements for horizontal deflection:

a) Depth: As detailed.

c. Steel Rigid Furring Channels: ASTM C645, hat-shaped, depth and minimum thickness of base (uncoated) metal as follows:

1) Depth: 7/8 inch.

2) Thickness: 0.0179 inch, unless otherwise indicated.

d. Furring Brackets: Serrated-arm type, adjustable, fabricated from corrosion-resistant steel sheet complying with ASTM C645, minimum thickness of base (uncoated) metal of 0.0329 inch, designed for screw attachment to steel studs and steel rigid furring channels used for furring.

e. Z-Furring Members: Manufacturer’s standard Z-shaped furring members with slotted or non-slotted web, fabricated from steel sheet complying with ASTM A653 or ASTM A568; with a minimum base metal (uncoated) thickness of 25 GA at interior non load bearing locations, face flange of 1-1/4-inch, wall-attachment flange of 7/8 inch, and of depth required to fit insulation thickness indicated.

f. Fasteners for Metal Framing: Provide fasteners of type, material, size, corrosion resistance, holding power, and other properties required to fasten steel framing and furring members securely to substrates involved; complying with the recommendations of gypsum board manufacturers for applications indicated.

3. Sheet Metal Backing/Strapping: Continuous sheet material fabricated from corrosion-resistant steel sheet in widths complying with ASTM C645.

a. Strapping: Provide 16-gauge x 2 inches width strapping at locations indicated on Drawings.

b. Backing: Behind all cabinetry and shelving, provide 16-gauge sheet metal backing, sized to match extent of cabinetry or shelving, inside of walls screwed directly on steel studs before gypsum wallboard is installed. Ensure flat gypsum installation as required by ANSI A108-A4.8. Use “MantisGrip” backing clips where appropriate. www.mantisgrip.com

4. Typical Framing Components:

a. Studs: "C" shaped with flat or formed webs.

b. Runners: U shaped, sized to match studs.

c. Ceiling Channels: C shaped.

d. Furring: Hat-shaped sections, minimum depth of 7/8 inch.

e. Deflection Track: Manufacturer’s deep-leg, U-shaped steel track; unpunched, with unstiffened flanges, of web depth to contain studs while allowing free vertical movement, with flanges designed to support horizontal and lateral loads.

5. Shaft Wall Studs and Accessories: ASTM C645; galvanized sheet steel, of size and properties necessary to comply with ASTM C754 and specified performance requirements.

6. Framing for Suspended and Furred Wallboard Ceilings: Type and size as specified in ASTM C754 for spacing required.

7. Partition Head to Structure Connections: Provide track fastened to structure with legs of sufficient length to accommodate deflection, for friction fit of studs cut short.

B. Gypsum Board

1. GWB-1: 5/8 inch thick with fiberglass mat laminated to both sides and with manufacturer's standard edges. Comply with ASTM C1658 and ASTM C1177/C1177M when used as exterior sheathing.

2. GWB-2: Same as GWB-1 except fire rated. Assemblies Indicated with Fire-Rating: Use type required by indicated tested assembly; if no tested assembly is indicated, use Type X board, UL or WH listed.

3. GWB-3: fiberglass-mat faced moisture and mold-resistant gypsum wallboard as defined in ASTM C1396/C1396M and complying with ASTM C1658. Sizes to minimize joints in place. Mold resistance: ASTM D3273, score of 10. Thickness as indicated on drawings.

4. GWB-4: Gypsum Shaftwall or Coreboard: ASTM C1396/C1396M; Type X or Type C core as required by indicated tested assembly; sizes to minimize joints in place; 1 inch thick; square, tongue and groove, or double beveled edges, ends square cut.

5. CBB-1: Cementitious Backerboard Substrate for Ceramic Wall Tile and Interior Acoustical Cement Plastering:

a. Backerboard: ANSI A118.9; ASTM C1325 High density, cementitious, glass fiber reinforced. 5/8” thick unless noted otherwise.

b. Mesh Tape: 2-inch wide self-adhesive, coated fiberglass mesh tape for joints and corners.

2.04 ACCESSORIES

A. Sound Attenuation Blankets:

1. Walls: Unfaced mineral-fiber blanket insulation produced by combining mineral fibers of glass or slag described below with thermosetting resins to comply with ASTM C665 for Type I (blankets without membrane facing):

a. Product: Provide one of the following:

1) Rockwool (Acoustical Fire Batts) AFB Rockwool International.

2) SAFB (Sound Attenuation Fire Blankets) by Thermafiber division of Owens Corning, Co.

2. Above Ceilings: Semi-Rigid Mineral Wool: ASTM C612, Type IVA, faced on one side with black facing, and with maximum flame-spread and smoke developed indexes of 25 and 50, respectively, pr ASTM E84; passing ASTM E136 for combustion characteristics:

a. Product: QuietFiber by Aoustiblok, or approved equal product by Rockwool, Owens Corning.

B. Acoustic Sealant: Non-hardening, non-skinning, non-sag, non-staining, paintable latex sealant, for use in conjunction with gypsum board, and complying with ASTM C919, ASTM C834, ASTM E90, ASTM E84 Class A and the following:

1. Products: Subject to compliance with requirements, provide one of the following:

a. AC-20 FTR Acoustical and Insulation Sealant, Pecora Corp.

b. SHEETROCK Acoustical Sealant, United States Gyp Co.

c. Or approved equal.

2. At fire-rated partitions, sealant must be approved for use in the Listed UL or GA Head-of-Wall joint system, in accordance with Article 2.1.

C. Corner Beads, Edge Trim, and Control Joints: Galvanized steel, or plastic, complying with ASTM C1047. Sheet steel zinc-coated by hot-dip process:

1. Shapes indicated below by reference to Fig. 1 designations in ASTM C1047:

a. Provide metal cornerbead on outside corners, unless otherwise indicated on Drawings.

b. LC-bead with both face and back flanges; face flange formed to receive joint compound. Use LC-beads for edge trim unless otherwise indicated.

c. L-bead with face flange only; face flange formed to receive joint compound. Use L-bead where indicated.

d. One-piece control joint formed with V-shaped slot, with removable strip covering slot opening.

D. Aluminum Accessories: Where indicated, provide manufacturer's standard extruded aluminum accessories of profile indicated or referenced by manufacturer's product designations, complying with the following requirements:

1. Aluminum Alloy: Alloy and temper recommended by aluminum producer and finisher for type of finish indicated and with not less than the strength and durability properties of aluminum extrusions complying with ASTM B221 for alloy and temper 6063-T5.

2. Class II Clear-Anodized Finish: AA-C12C22A3 1 (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: etched, medium matte; Anodic.

E. Joint Materials: ASTM C475 and as recommended by gypsum board manufacturer for project conditions:

1. Joint Tape: Provide paper reinforcing tape, unless otherwise indicated.

2. Setting-Type Joint Compounds for Gypsum Board: Factory-packaged, job-mixed, chemical-hardening powder products formulated for uses indicated:

a. Where setting-type joint compounds are indicated as a taping compound only or for taping and filling only, use formulation that is compatible with other joint compounds applied over it.

b. For pre-filling gypsum board joints, use formulation recommended by gypsum board manufacturer for this purpose.

c. For filling joints and treating fasteners of water-resistant gypsum backing board behind base for ceramic tile, use formulation recommended by the gypsum board manufacturer for this purpose.

d. For topping compound, use sandable formulation.

3. Drying-Type Joint Compounds for Gypsum Board: Factory-packaged vinyl-based products complying with the following requirements for formulation and intended use:

a. Ready-Mixed Formulation: Factory-mixed product.

b. Job-Mixed Formulation: Powder product for mixing with water at Project site.

c. Taping compound formulated for embedding tape and for first coat over fasteners and face flanges of trim accessories.

d. Topping compound formulated for fill (second) and finish (third) coats.

F. Screws: ASTM C1002; self-drilling type unless otherwise noted. Provide corrosion resistant coated steel drill screws in accordance with manufacturer recommendations at all exterior and wet interior locations.

G. Laminating Adhesive: Special adhesive or joint compound recommended for laminating gypsum panels.

H. Fastening Adhesive for Metal: Special adhesive recommended for laminating gypsum panels to steel framing.

I. Anchorage to Substrate: Corrosion resistant tie wire, nails, screws, fasteners, sealants and other metal supports, of type and size to suit application; to rigidly secure materials in place.

J. Cast-In-Place and Post-Installed Anchors in Concrete: Chemical, Expansion, or Cast in place anchors, fabricated from corrosion-resistant materials, with holes or loops for attaching hanger wires, and with capability to sustain, without failure, a load equal to

5 times that imposed by ceiling construction, as determined from testing in accordance with ASTM E488 conducted by an Independent Testing Laboratory.

K. Powder-Actuated Fasteners in Concrete: Fastener system of type suitable for application indicated, fabricated from corrosion-resistant materials, with clips or other accessory devices for attaching hangers of type indicated, and with capability to sustain, without failure, a load equal to 10 times that imposed by ceiling construction, as determined by testing in accordance with ASTM E1190 conducted by an Independent Testing Laboratory.

L. Wire for Hangers and Ties: ASTM A641, Class 1 zinc coating, soft temper. 0.1620- inch (8 gauge) diameter.

M. Hanger Rods: Mild steel and zinc-coated or protected with rust-inhibitive paint.

N. Flat Hangers: Mild steel and zinc-coated or protected with rust-inhibitive paint.

O. Angle-Type Hangers: Angles with legs not less than 7/8 inch wide, formed from 0.0635-inch-thick galvanized steel sheet complying with ASTM A446 Coating Designation 090, with bolted connections and 5/16-inch-diameter bolts.

P. Elastomeric Spray-Applied Membrane: At fire-rated partitions, membrane must be approved for use in the Listed UL or GA Head-of-Wall joint system, in accordance with Article 2.1:

1. CP 672 Fire Spray by Hilti Construction Chemicals.

2. Metacaulk 1200 and Biostop 750 by Rectorseal.

3. SpecSeal AS 200 Elastomeric Spray, by Specified Technologies, Inc.

2.05 FINISHES

A. Gypsum Board:

1. Finish gypsum board to the Levels shown in the schedule at the end of Part 3 for different applications. Finish Levels to comply with GA 214 “Recommended Levels of Gypsum Board Finish”.

2. Finish water-resistant gypsum backing board forming substrate for ceramic tile to comply with ASTM C840 and board manufacturer’s directions for treatment of joints behind tile.

3. Tape, fill, and sand exposed joints, edges, and corners to produce smooth surface ready to receive finishes:

a. Feather coats of joint compound so that camber is maximum 1/32 inch.

4. Fill and finish joints and corners of cementitious backing board as recommended by manufacturer.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Verify that project conditions are appropriate for work of this section to commence. Examine substrates to which gypsum board assemblies attach or abut, installed hollow metal frames, cast-in-anchors, and structural framing with Installer present for compliance with requirements for installation tolerances and other conditions affecting performance of assemblies specified in this Section. Do not proceed with installation until unsatisfactory conditions have been corrected:

1. Notify Resident Engineer 7 days in advance of date and time when Work, or part of Work, will be ready for ceiling framing observation.

3.02 PREPARATION

A. Ceiling Anchorages: Coordinate installation of ceiling suspension systems with installation of overhead structural assemblies to ensure that inserts and other provisions for anchorages to building structure have been installed to receive ceiling hangers that will develop their full strength and at spacing required to support ceilings:

1. Furnish concrete inserts and other devices indicated to other trades for installation well in advance of time needed for coordination with other construction.

3.03 METAL FRAMING INSTALLATION

A. Shaft Wall:

1. General: Install gypsum board shaft-wall assemblies to comply with performance and other requirements indicated as well as with manufacturer's installation instructions and the following:

   a. ASTM C754 for installing steel framing.

2. Do not bridge building expansion joints with shaft-wall assemblies; frame both sides of joints with furring and other support as indicated.

3. Install supplementary framing in gypsum board shaft-wall assemblies around openings and as required for blocking, bracing, and support of gravity and pullout loads of fixtures, equipment, services, heavy trim, furnishings, and similar items that cannot be supported directly by shaft-wall assembly framing:

   a. Support elevator hoistway door frames independently of shaft-wall framing assemblies or reinforce assemblies according to assembly manufacturer's instructions.

   b. Where handrails are indicated for direct attachment to gypsum board shaft-wall assemblies, provide not less than a 0.0341-inch-thick by 4-inch-wide galvanized steel reinforcement strip, accurately positioned and secured behind not less than 1 gypsum board face layer of 1/2-inch or 5/8-inch thickness.

4. Coordinate gypsum board shaft-wall construction with fireproofing applied to structural elements so both remain complete and undamaged. Patch or replace sprayed-on fireproofing removed or damaged during the installation of shaft-wall assemblies to comply with requirements specified in Section 07 81 00 - Applied Fire Protection.

5. Integrate stair hanger rods with gypsum board shaft-wall assemblies where indicated (and where possible) by locating cavity of assemblies where required to enclose rods.

6. At penetrations in shaft wall, maintain fire-resistance rating of entire shaft-wall assembly by installing supplementary steel framing around perimeter of penetration and fire protection behind boxes containing wiring devices, elevator call buttons, elevator floor indicators, and similar items.

7. Isolate shaft-wall assemblies from building structure at locations indicated to prevent transfer of loading imposed by structural movement. Comply with details indicated on Drawings.

8. Seal gypsum board shaft-walls at perimeter of each section that abuts other work and at joints and penetrations within each section. Install acoustical sealant to withstand dislocation by air pressure differential between shaft and external spaces; comply with manufacturer’s instructions and ASTM C919.

9. Shaft Wall Framing: Comply with manufacturer's installation instructions:

    a. Install studs at spacing required to meet performance requirements.

B. Metal Framing:

1. Metal Framing General: Comply with ASTM C754 and manufacturer's instructions, ASTM C754 and with ASTM C840 requirements that apply to framing installation.

    a. Install supplementary framing, blocking, and bracing at terminations in gypsum board assemblies to support fixtures, equipment services, heavy trim, grab bars, toilet accessories, furnishings, or similar construction. Comply with details indicated and with recommendations of gypsum board manufacturer or, if none are available, with "Gypsum Construction Handbook" published by United States Gypsum Co.

    b. Isolate steel framing from building structure at locations indicated to prevent transfer of loading imposed by structural movement. Comply with details shown on Drawings:

        1) Where building structure abuts ceiling perimeter or penetrates ceiling.

        2) Where partition framing and wall furring abut structure except at floor.

            a) Provide slip- or cushioned-type joints as detailed to attain lateral support and avoid axial loading.

        3) Install elastomeric spray-applied sealant and mineral wool deck flute packing as required at deflection track in accordance with manufacturer's instructions.

    c. Do not bridge building expansion and control joints with steel framing or furring members. Independently frame both sides of joints with framing or furring members as indicated.

    d. Provide anchorage bracing and support designed to meet structural seismic requirements of relevant building code.

2. Suspended Ceilings and Soffits:

    a. Suspend ceiling hangers from building structural members and as follows:

        1) Install hangers plumb and free from contact with insulation or other objects within ceiling plenum that are not part of supporting structural or ceiling suspension system. Splay hangers only where required to miss obstructions and offset resulting horizontal forces by bracing, counter-splaying, or other equally effective means.

2) Where width of ducts and other construction within ceiling plenum produces hanger spacing that interfere with the location of hangers required to support standard suspension system members, install supplemental suspension members and hangers in form of trapezes or equivalent devices. Size supplemental suspension members and hangers to support ceiling loads within performance limits established by referenced standards and requirements of AHJ.

3) Secure wire hangers by looping and wire-tying, either directly to structures or to inserts, screw eyes, or other devices and fasteners that are secure and appropriate for substrate, and in a manner that will not cause them to deteriorate or otherwise fail due to age, corrosion, or elevated temperatures.

4) Secure flat, angle, channel, and rod hangers to structure, including intermediate framing members, by attaching to inserts, screw eyes, or other devices and fasteners that are secure and appropriate for structure as well as for type of hanger involved, and in a manner that will not cause them to deteriorate or fail due to age, corrosion, or elevated temperatures.

5) Do not support ceilings directly from permanent metal forms. Furnish cast-in- place hanger inserts that extend through forms.

6) Do not attach hangers to steel deck tabs.

7) Do not attach hangers to steel roof deck. Attach hangers to structural members.

8) Do not connect or suspend steel framing from ducts, pipes or conduit.

b. Sway-brace suspended steel framing with hangers used for support.

c. Install suspended steel framing components in sizes and at spacing indicated but not less than that required by the referenced steel framing installation standard:

1) Wire Hangers: 4 feet on center.

2) Carrying Channels (Main Runners): 1-1/2 inch, 4 feet on center.

3) Rigid Furring Channels (Furring Members): 16 inches on center.

d. Installation Tolerances: Install steel framing components for suspended ceilings so that cross-furring members or grid suspension members are level to within 1/8 inch in 12 feet as measured both lengthwise on each member and transversely between parallel members.

e. Wire-tie or clip furring members to main runners and to other structural supports as indicated.

f. Grid Suspension System: Attach perimeter wall track or angle where grid suspension system meets vertical surfaces. Mechanically join main beam and cross-furring members to each other and butt-cut to fit into wall track.

g. Install bracing as required at exterior locations to resist wind uplift.

3. Framing for Walls and Partitions:

   a. Install runners (tracks) at floors, ceilings, and structural walls and columns where gypsum board stud assemblies abut other construction.

   b. For STC-rated and fire-resistive-rated partitions seal runners (tracks) to floor and underside of roof deck as indicated in the Listed Assembly per Article 2.01.

   c. Installation Tolerances: Install each steel framing and furring member so that fastening surfaces do not vary more than 1/8 inch from the plane formed by the faces of adjacent framing.

   d. Extend partition framing full height to structural supports or substrates above suspended ceilings, except where partitions are indicated to terminate at suspended ceilings. Cut studs 1/2 inch short of full height. Continue framing over frames for doors and openings and frame around ducts penetrating partitions above ceiling to provide support for gypsum board:

      1) For STC-rated and fire-resistive-rated partitions requiring partitions to extend to the underside of floor/roof slabs and decks or other continuous solid structural surfaces to obtain ratings, install framing around structural and other members extending below floor/roof slabs and decks, as needed, to support gypsum board closures needed to make partitions continuous from floor to underside of solid structure.

   e. Terminate partition framing at suspended ceilings where indicated.

   f. Install steel studs and furring in sizes and at spacing indicated but not less than that required by the referenced steel framing installation standard to comply with maximum deflection and minimum loading requirements specified.

   g. Install steel studs so that flanges point in the same direction and so that leading edges or ends of each gypsum board can be attached to open (unsupported) edges of stud flanges first.

   h. Frame door openings to comply with details indicated, with GA-219, and with applicable published recommendations of gypsum board manufacturer. Attach vertical studs at jambs with screws either directly to frames or to jamb anchor clips on door frames; install runner track section (for cripple studs) at head and secure to jamb studs:

      1) Extend vertical jamb studs through suspended ceilings and attach to underside of floor or roof structure above.

   i. Frame openings other than door openings to comply with details indicated or, if none indicated, in same manner as required for door openings. Install framing below sills of openings to match framing required above door heads.

4. Openings: Reinforce openings as required for weight of doors or operable panels, using not less than double studs at jambs.

5. Standard Wall Furring: Install at masonry walls scheduled to receive gypsum board, not more than 4 inches from floor and ceiling lines and abutting walls. Secure in place on alternate channel flanges at maximum 24 inches on center:

a. Orientation: Horizontal.

6. Blocking: Install supplementary framing, and blocking to support fixtures, equipment services, heavy trim, grab bars, toilet accessories, furnishings, or similar construction.

3.04 GYPSUM BOARD INSTALLATION

A. Comply with ASTM C840 and GA-216. Install to minimize butt end joints, especially in highly visible locations:

1. Gypsum Soffit Board: Install perpendicular to framing, with staggered end joints over framing members or other solid backing.

2. Cementitious Backing Board: Install over steel framing members where indicated, in accordance with ANSI A108.11 and manufacturer's instructions. Curved Surfaces: Apply gypsum board to curved substrates in accordance with GA-226.

3. Moisture Protection: Treat cut edges and holes in moisture resistant gypsum board and exterior gypsum soffit board with sealant.

4. Install ceiling board panels across framing to minimize the number of abutting end joints and avoid abutting end joints in the central area of each ceiling. Stagger abutting end joints of adjacent panels not less than one framing member. Do not install water resistant gypsum backing board at ceiling locations.

5. Install wall/partition board panels to minimize the number of abutting end joints or avoid them entirely. Stagger abutting end joints not less than one framing member in alternate courses of board. At stairwells and other high walls, install panels horizontally with end abutting joints over studs and staggered.

6. Install gypsum panels with face side out. Do not install imperfect, damaged, or damp panels. Butt panels together for a light contact at edges and ends with not more than 1/16 inch of open space between panels. Do not force into place.

7. Locate both edge or end joints over supports, except in ceiling applications where intermediate supports or gypsum board back-blocking is provided behind end joints. Position adjoining panels so that tapered edges abut tapered edges, and field-cut edges abut field-cut edges and ends. Do not place tapered edges against cut edges or ends. Stagger vertical joints over different studs on opposite sides of partitions. Avoid joints at corners of framed openings where possible.

8. Attach gypsum panels to steel studs so that the leading edge or end of each panel is attached to open (unsupported) edges of stud flanges first.

9. Attach gypsum panels to framing provided at openings and cutouts.

10. Form control joints and expansion joints at locations indicated and as detailed, with space between edges of adjoining gypsum panels, as well as supporting framing behind gypsum panels.

11. Cover both faces, of steel stud partition framing with gypsum panels in concealed spaces (above ceilings), except in chase walls that are braced internally:

a. Except where concealed application is indicated or required for sound, fire, air, or smoke ratings, coverage may be accomplished with scraps of not less than 8 square feet in area.

b. Fit gypsum panels around ducts, pipes, and conduits.

12. Space fasteners in gypsum panels according to referenced gypsum board application and finishing standard and manufacturer's recommendations.

13. Tolerances:

    a. Maximum Variation of Finished Gypsum Board Surface from True Flatness: 1/8 inch in 10 feet in any direction.

B. Gypsum Board Application Methods:

1. Single-Layer Application: Install gypsum wallboard panels as follows:

    a. On ceilings, apply gypsum panels prior to wall partition board application to the greatest extent possible and at right angles to framing, unless otherwise indicated. Provide firm bearing for all ends and edges.

    b. On partitions/walls, apply gypsum panels vertically (parallel to framing), unless otherwise indicated, and provide panel lengths that will minimize end joints. Provide firm bearing for all ends and edges.

    c. On Z-furring members, apply gypsum panels vertically (parallel to framing) with no end joints. Locate edge joints over furring members.

2. Double-Layer Application: Install same gypsum wallboard as scheduled for base layers and for face layers:

    a. On ceilings, apply base layer prior to applying base layer on walls/partitions; apply face layers in same sequence. Offset face-layer joints at least 10 inches from parallel base-layer joints. Apply base layers at right angles to framing members unless otherwise indicated.

    b. On partitions/walls, apply base layers and face layers vertically (parallel to framing) with joints of base layers located over stud or furring member and face layer joints offset at least one stud or furring member with base layer joints. Stagger joints on opposite sides of partitions.

    c. On Z-furring members, apply base layer vertically (parallel to framing) and face layer either vertically (parallel to framing) or horizontally (perpendicular to framing) with vertical joints offset at least one furring member. Locate edge joints of base layer over furring members.

3. Wall Tile Substrates: For substrates indicated to receive thin-set ceramic tile and similar rigid applied wall finishes, comply with the following:

    a. Install tile backer board to comply with ANSI Al08.11.

4. Single-Layer Fastening Methods: Apply gypsum panels to supports as follows:

    a. Fasten with screws.

5. Double-Layer Fastening Methods: Apply base layer of gypsum panels and face layer to base layer as follows:

    a. Fasten both base layers and face layers separately to supports with screws.

    b. Fasten base layers with screws and face layer with adhesive and supplementary fasteners.

C. Trim and Accessories:

1. Control Joints: Place control joints consistent with lines of building spaces and as indicated:

   a. Not more than 30 feet apart on walls and ceilings over 50 feet long.

   b. At exterior soffits, not more than 30 feet apart in both directions.

2. Corner Beads: Install at external corners, using longest practical lengths.

3. Edge Trim: Install at locations where gypsum board abuts dissimilar materials. Install edge trim where edge of gypsum panels would otherwise be exposed or semi-exposed. Provide edge trim type with face flange formed to receive joint compound except where other types are indicated:

   a. Install LC-bead where gypsum panels are tightly abutted to other construction and back flange can be attached to framing or supporting substrate.

   b. Install L-bead where edge trims can only be installed after gypsum panels are installed.

D. Joint Treatment:

1. General: Apply joint treatment at gypsum board joints (both directions); flanges of corner bead, edge trim, and control joints; penetrations; fastener heads, surface defects, and elsewhere as required to prepare gypsum board surfaces for decoration and levels of gypsum board finish indicated:

   a. Pre-fill open joints rounded or beveled edges, and damaged areas using setting-type joint compound.

   b. Apply joint tape over gypsum board joints except those with trim accessories having concealed face flanges not requiring taping to prevent cracks from developing in joint treatment at flange edges.

   c. Apply joint tape over gypsum board joints and to trim accessories with concealed face flanges as recommended by trim accessory manufacturer and as required to prevent cracks from developing in joint compound at flange edges.

3.05 CLEANING

A. Promptly remove any residual joint compound from adjacent surfaces.

3.06 PROTECTION

A. Provide final protection and maintain conditions, in a manner suitable to Installer that ensures gypsum board assemblies remain without damage or deterioration at time of Completion.

B. Repair or replace GWB damaged during construction to match the quality and appearance of the original finish.

3.07 SCHEDULES

A. Finish Levels:

1. Finish gypsum board in scheduled areas in accordance with levels defined in ASTM C840, GA-214 and as scheduled below.

2. Level 1: Above finished ceilings concealed from view, for ceiling plenum areas, and where indicated, unless a higher level of finish is required for fire-resistive-rated assemblies and/or sound-rated assemblies.

3. Level 2: Utility areas and where cementitious backing board panels form substrates for tiling, and where indicated.

4. Level 3: Standard finish level unless otherwise noted.

5. Level 4: To be used at buildings in personnel spaces, including offices and crew facilities.

6. Level 5: Use where recommend by gypsum board manufacturer and GA-214 to achieve satisfactory finish on glass-mat faced gypsum, and where required by wall covering and/or tile manufacturer.

    a. Level 5 finish is required for office and crew facilities and public lobbies where satisfactory finish results cannot be achieved with a level 4 finish, as determined via mock-up.

END OF SECTION

SECTION 09 22 16

NON-STRUCTURAL METAL FRAMING

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Requirements for the following:

a. Metal partition, ceiling, and soffit framing for assemblies not containing gypsum board.

b. Interior suspension systems for non-gwb ceilings.

c. Blocking and backing panels.

d. Furring channels and supports for non-gwb finishes.

B. This section does not include:

1. Gypsum board assemblies.

2. Fire-rated assemblies and shaft walls.

3. Load-bearing framing.

1.02 REFERENCES

A. ASTM A641/A641M - Standard Specification for Zinc-Coated (Galvanized) Carbon Steel wire.

B. ASTM A653/A653M - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.

C. ASTM C635/635M - Standard Specification for Manufacturer, Performance and Testing of Metal Suspension Systems for Acoustical Tile and Lay-in Panel Ceilings.

D. ASTM C636 - Standard Practice for Installation of Metal Ceiling Suspension Systems for Acoustical Tile and Lay-in Panels.

E. ASTM C645 - Standard Specification for Nonstructural Steel Framing Members.

F. ASTM C754 - Standard Specification for Installation of Steel Framing Members to Receive Screw-Attached Gypsum Panel Products.

G. ASTM E90 - Standard Test Method for Laboratory Measurement of Airborne Sound Transmission Loss of Building Partitions and Elements.

H. ASTM E413 - Classification for Rating Sound Insulation.

I. ASTM E580 - Standard Practice for Installation of Ceiling Suspension Systems for Acoustical Tile and Lay-in Panels in Areas Subject to Earthquake Ground Motions.

1.03 SUBMITTALS

A. Delegated-Design Submittal: For assemblies indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer, currently licensed in the State of Washington, who is responsible for their preparation.

B. Product Data: Provide data describing framing member materials and finish, product criteria, load charts, and limitations. Provide manufacturer's data on partition head to structure connectors, showing compliance with requirements.

C. LEED Submittals:

1. Where LEED certification is required by the project, submit the same documentation for approval as required by GBCI as a project submittal. Highlight the relevant LEED information.

2. LEED documentation is to be submitted separately and titled LEED SUBMITTAL.

3. Building Product Disclosure and Optimization credit data: Submit data to support the LEED SUBMITTAL.

D. Shop Drawings:

1. Indicate required flashings, sealing at openings.

2. Indicate acoustic details.

3. Describe method for securing studs to tracks, splicing, and for blocking and reinforcement of framing connections.

E. Qualification Data: For Installer and design engineer.

F. Manufacturer's Installation Instructions: Indicate special preparation of substrate, installation and attachment methods, and perimeter conditions requiring special attention.

1.04 QUALITY ASSURANCE

A. Designer Qualifications: Professional structural engineer with 5 years of documented experience in design of this work and licensed in the location of the project.

B. Installer Qualifications: Company specializing in performing the work of this section with minimum 5 years of documented experience on projects of similar size and complexity.

1.05 DELIVERY, STORAGE, AND HANDLING

A. As required by the manufacturer for a warrantable installation of the installed products to meet the Performance and Design Criteria.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. Perform Work in accordance with ASTM C645.

B. Coordinate the placement of components to be installed within stud framing system.

C. Ceiling Assemblies: Coordinate with installation of overhead structure to ensure that inserts and other provisions for anchorages to building structure have been installed to receive hangers at spacing required to support the Work and that hangers will develop their full strength.

D. Design and install framing and furring to limit deflection to the following under point loads of 100 lbs. and uniform loads as noted below psf except where required to withstand greater load. (pressurized shafts and stairwells for example):

1. Maximum Deflection of Vertical Assemblies:

a. Assemblies spanning single floor: Sustained loads of 5 lbf/sq ft with a maximum mid span deflection of 1:240.

b. Assemblies spanning multiple floors: Sustained loads of 7.5 lbf/sq ft with a maximum mid span deflection of 1:240.

2. Maximum Deflection of Horizontal Assemblies: 1:240 deflection under dead loads and wind uplift.

3. Maximum Deflection for assemblies under applied plaster finishes (Portland Cement or Gypsum) and ceramic tile is 1:360. Comply with requirements in ASTM C840 that apply to framing installation for gypsum board assemblies.

4. Use The SSMA Product Technical Information Book to look up the appropriate stud size, spacing and thickness.

E. Ceiling and Soffit Framing:

1. Seismic Requirements:

a. Classification; Confirm to ASTM C635, heavy Duty Classification.

b. Code Compliance: FBC, American Society of Civil Engineers ASCE 7 Section 13 and CISCA Guidelines.

F. STC-Rated Assemblies: For STC-rated assemblies, provide materials and construction identical to those tested in assembly indicated on Drawings, according to ASTM E90 and classified according to ASTM E413 by an independent testing agency.

2.02 MANUFACTURERS

A. Specification is based on products by members in good standing of the Steel Stud Manufacturer's Association.

2.03 FRAMING SYSTEMS

A. Framing Members, General: Comply with ASTM C754 for conditions indicated. Comply with manufacturer’s requirements for height/ span limitations for non-gypsum assemblies:

1. Steel Sheet Components: Comply with ASTM C645 requirements for metal unless otherwise indicated.

2. Protective Coatings: ASTM A653/A653M, G60 and G90, hot-dip galvanized:

a. G60, unless noted otherwise.

b. G90 at exterior conditions and where indicated on the Drawings.

B. Partition Head to Structure Connections: Provide mechanical anchorage devices that accommodate deflection using slotted holes, screws and anti-friction bushings, preventing rotation of studs while maintaining structural performance of partition.

1. Material:

a. Typical: ASTM A653/A653M steel sheet, SS Grade 50, with G40/Z120 hot dipped galvanized coating.

b. Areas Subject to Moisture: ASTM A653/A653M steel sheet, SS Grade 50, with G60/Z180 hot dipped galvanized coating. Areas include exterior or non-conditioned space, shower rooms, locker rooms or other locations subject to regular wetting or high humidity.

C. Studs and Tracks: ASTM C645:

1. Steel Studs and Tracks:

a. Minimum Base-Metal Thickness: 0.0329 inch.

D. Slip-Type Head Joints: Where indicated, provide one of the following:

1. Double-Track System: ASTM C645 top outer tracks, inside track with 2-inch- deep flanges in thickness not less than indicated for studs and fastened to studs, and outer track sized to friction-fit over inner track.

2. Deflection Track: Steel sheet top track manufactured to in accordance with STC details on the Drawings and to prevent cracking of finishes applied to interior partition framing resulting from deflection of structure above:

a. In thicknesses matching those indicated for studs and in widths to accommodate depth of studs.

E. Flat Strap and Backing Plate: Steel sheet for blocking and bracing in length and width indicated:

1. Minimum Base-Metal Thickness: 0.0179 inch.

F. Cold-Rolled Channel Bridging: Steel, 0.0538-inch minimum base-metal thickness, with minimum 1/2-inch- wide flanges.

G. Hat-Shaped, Rigid Furring Channels: ASTM C645.

1. Minimum Base-Metal Thickness: 0.0179 inch.

2. Depth: As indicated on Drawings.

H. Z-Shaped Furring: With slotted or nonslotted web, face flange of 1-1/4 inches, wall attachment flange of 7/8 inch, minimum uncoated-metal thickness of 0.0179 inch, and depth required to fit insulation thickness indicated.

2.04 SUSPENSION SYSTEMS

A. Tie Wire: ASTM A641/A641M, Class 1 zinc coating, soft temper, 0.062-inch- diameter wire, or double strand of 0.048-inch- diameter wire.

B. Wire Hangers: ASTM A641/A641M, ASTM 636, Class 1 zinc coating, soft temper, 0.16 inch in diameter.

C. Carrying Channels (Main Runners): Cold-rolled, commercial-steel sheet with a base-metal thickness of 0.0538 inch and minimum 1/2-inch- wide flanges.

D. Furring Channels (Furring Members):

1. Cold-Rolled Channels: 0.0538-inch uncoated-steel thickness, with minimum 1/2-inch-wide flanges, 3/4 inch deep.

2. Steel Studs and Tracks: ASTM C645:

a. Minimum Base-Metal Thickness: 0.0179 inch

3. Hat-Shaped, Rigid Furring Channels: ASTM C645, 7/8 inch deep or as indicated on the drawings:

a. Minimum Base-Metal Thickness: 0.0179 inch.

E. Grid Suspension System for Ceilings: ASTM C635 ASTM C636, ASTM E580, direct-hung system composed of main beams and cross-furring members that interlock.

F. Blocking and backing panels:

1. Sheet Metal Backing (Blocking): 0.036 inch thick, galvanized. 4-inch minimum width

2. In walls, provide blocking attached to studs as backing and support for wall-mounted items, unless item can be securely fastened to two or more studs or other method of support is explicitly indicated.

3. Where ceiling-mounting is indicated, provide blocking and supplementary supports above ceiling, unless other method of support is explicitly indicated.

4. Specifically, provide non-structural framing and blocking at the following locations:

a. Cabinets and shelf supports.

b. Wall brackets.

c. Handrails.

d. Grab bars.

e. Towel and bath accessories.

f. Wall-mounted door stops.

g. Whiteboards and marker boards.

h. Wall paneling and trim.

i. Joints of rigid wall coverings that occur between studs.

2.05 AUXILIARY MATERIALS

A. General: Provide auxiliary materials that comply with referenced installation standards.

1. Fasteners for Steel Framing: Of type, material, size, corrosion resistance, holding power, and other properties required to fasten steel members to substrates.

2. All accessory materials required by the manufacturer for a warrantable installation of the installed products in a manner that meets the Performance and Design Criteria.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Verify that rough-in utilities are in proper location.

B. Verify existing conditions meet the manufacturer's requirements before starting work.

3.02 INSTALLATION OF STUD FRAMING

A. General: Install all materials in accordance with manufacturer's instructions based on conditions present.

B. Comply with requirements of ASTM C754.

C. Extend partition framing to structure unless noted otherwise:

1. Partitions Terminating at Ceiling: Attach ceiling runner securely to ceiling track in accordance with manufacturer's instructions.

2. Partitions Terminating at Structure: Attach top runner to structure, maintain clearance between top of studs and structure, and connect studs to track using specified mechanical devices in accordance with manufacturer's instructions; verify free movement of top of stud connections; do not leave studs unattached to track.

D. At partitions indicated with an acoustic rating:

1. Provide components and install as required to produce STC ratings as indicated.

2. Place two beads of acoustic sealant (one on either side) between runners and substrate, studs and adjacent construction.

3. Place one bead of acoustic sealant between studs and adjacent vertical surfaces.

4. Acoustic Insulation: Place tightly within spaces, around cut openings, behind and around electrical and mechanical items within partitions, and tight to items passing through partitions.

E. Fit runners under and above openings; secure intermediate studs to same spacing as wall studs.

F. Backing and Blocking: Use steel channels or flat sheets secured to studs minimum 4 inch wide. Provide blocking for support of all wall hung items and equipment.

1. Use sheet metal backing for reinforcement of 16 gauge minimum.

G. Install supplementary framing and bracing at openings and terminations in the work and for support of fixtures, equipment services, heavy trim, grab bars, toilet accessories, furnishings, and similar construction to comply with details indicated and with recommendations of fixture manufacturer.

H. Isolate steel framing from building structure to prevent transfer of loading imposed by structural movement:

1. Where edges of suspended ceilings abut building structure at ceiling perimeters and at penetrations of structural elements.

2. Where partition and wall framing abuts overhead structure.

3. Where studs are installed directly against exterior walls of masonry or concrete, install asphalt felt strips between studs and wall.

3.03 CEILING AND SOFFIT FRAMING

A. Comply with requirements of ASTM C635, ASTM C636, and ASTM E580.

B. Install furring after work above ceiling or soffit is complete. Coordinate the location of hangers with other work.

C. Install furring independent of walls, columns, and above-ceiling work.

D. Acoustical sealant may be used in place of asphalt felt strips between the interior studs and exterior CMU or concrete walls.

E. Securely anchor hangers to structural members or embed in structural slab. Space hangers as required to limit deflection to criteria indicated. Use rigid hangers at exterior soffits.

F. Space main carrying channels at maximum 72 inch on center, and not more than 6 inches from wall surfaces. Lap splice securely.

G. Securely fix carrying channels to hangers to prevent turning or twisting and to transmit full load to hangers.

H. Place furring channels perpendicular to carrying channels, not more than 2 inches from perimeter walls, and rigidly secure. Lap splices securely.

I. Reinforce openings in suspension system that interrupt main carrying channels or furring channels with lateral channel bracing. Extend bracing minimum 24-inches past each opening.

J. Laterally brace suspension system:

1. Sway-brace suspension systems with hangers used for support.

3.04 TOLERANCES

A. Maximum Variation From True Position: 1/8 inch in 10 feet.

B. Maximum Variation From Plumb: 1/8 inch in 10 feet.

C. Level ceiling to a tolerance of 1/1200. For tilted ceilings maintain this tolerance as a "flatness". tolerance.

3.05 PROTECTION

A. Protect installed work as required by the manufacturer to maintain product performance, design criteria and warranty.

END OF SECTION

SECTION 09 67 25

DIELECTRIC EPOXY FLOORING

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for trowel-applied dielectric, epoxy-resin flooring for Traction Power Substation floors.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. ASTM International (ASTM):

a. ASTM D149 - Standard Test Method for Dielectric Breakdown Voltage and Dielectric Strength of Solid Electrical Insulating Materials at Commercial Power Frequencies.

b. ASTM D695 - Standard Test Method for Compressive Properties of Rigid Plastics.

c. ASTM D4541 - Standard Test Method for Pull-Off Strength of Coatings Using Portable Adhesion Testers.

1.03 COORDINATION

A. Pre-installation Meetings: Conduct conference at Project site. Review methods and procedures related to flooring including, but not limited to, the following:

1. Inspect and discuss condition of substrate and other preparatory work performed by other trades.

2. Review and finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.

3. Cure time before testing.

1.04 SUBMITTALS

A. Submit:

1. Product Data: Include preparation and installation instructions.

2. Qualification Statements: Installer Certificates signed by manufacturers certifying that installers comply with requirements.

1.05 QUALITY ASSURANCE

A. Installer Qualifications: Engage an installer who is certified in writing by epoxy flooring manufacturer as qualified to install manufacturer's products.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Deliver materials to Project site in supplier's original wrappings and containers, labeled with source's or manufacturer's name, material or product brand name, and lot number if any.

B. Store materials in their original, undamaged packages and containers, inside a wellventilated area protected from weather, moisture, soiling, extreme temperatures, and humidity.

1.07 FIELD/SITE CONDITIONS

A. Ambient Conditions: Comply with manufacturer's written instructions for substrate temperature, ambient temperature, moisture, ventilation, and other conditions affecting flooring installation.

B. Provide permanent lighting or, if permanent lighting is not in place, simulate permanent lighting conditions during flooring installation.

C. Close spaces to traffic during flooring application and for not less than 24 hours after application unless manufacturer specifies a longer period.

PART 2 - PRODUCTS

2.01 PERFORMANCE/DESIGN REQUIREMENTS

A. Provide flooring capable of the following when applied at 1/4 inch thickness:

1. Dielectric Service, in accordance with ASTM D149: 58,000 Vdc.

2. Bond Strength to Concrete in accordance with ASTM D4541: 400 psi minimum.

3. Abrasion Resistance: Not more than 0.5 grams loss when tested with Tabor abrader with 1000 gram load for 1000 cycles.

4. Compressive Strength in accordance with ASTM D695: 8500 psi.

B. Performance of In-Place Flooring: Capable of withstanding testing conditions specified in Section 34 21 16.11 - Traction Power Substation Testing, without arcing or passing current beyond specified limit.

2.02 PRODUCTS MATERIALS

A. Manufacturers:

1. Basis of Design: Hallemite Dielectric Grey Amazite by RBC Industries, Inc., or approved as equal by the Engineer of Records.

B. Description : Dielectric epoxy flooring system.

1. Thickness: 1/4 inch nominal.

2. Color: Manufacturer’s standard grey.

C. Epoxy-Resin Matrix: Manufacturer's standard requirement for use indicated.

D. Aggregates: Silica sand in gradation as required by resin manufacturer.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine substrate and area, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions, including levelness tolerances, have been corrected.

3.02 PREPARATION

A. Clean substrates of substances, including oil, grease, and curing compounds, that might impair flooring bond. Provide clean, dry, and neutral substrate for flooring application.

B. Seal conduits and drains to prevent the entrance of the epoxy and apply masking to prevent the encapsulation of grounding conductors.

C. Verify that concrete substrates are dry and moisture-vapor emissions are within acceptable levels according to manufacturer's written instructions.

D. Concrete Slabs:

1. Provide sound concrete surfaces free of laitance, glaze, efflorescence, curing compounds, form-release agents, dust, dirt, grease, oil, and other contaminants incompatible with flooring.

a. Shot-blast surfaces with an apparatus that abrades the concrete surface, contains the dispensed shot within the apparatus, and recirculates the shot by vacuum pickup.

b. Repair damaged and deteriorated concrete according to flooring manufacturer's written instructions.

c. Use patching and fill material to fill holes and depressions in substrates according to flooring manufacturer's written instructions.

E. Metal Flooring:

1. Clean metal of oils with suitable approved mineral based cleaner.

2. Grind entire surface to be coated with 36 Grit Grinding Wheel.

3. Clean with solvent to remove products of grinding.

F. Apply masking at stop points and at adjacent surfaces which are not to be coated, so that the flooring will finish at clean lines.

3.03 EPOXY FLOORING INSTALLATION

A. Extent and Location

1. See Traction Electrification Equipment Layout drawings.

B. Place and finish flooring according to manufacturer's written instructions.

C. Ensure that matrix components and fluids from grinding operations do not stain flooring by reacting with divider and control-joint strips.

D. Primer: Apply to flooring substrates according to manufacturer's written instructions.

E. Install epoxy floor coating to a minimum thickness of 1/4 inch as a one piece surface, completely free from cracks and joints, in accordance with manufacturer's instructions. Apply the epoxy to the area shown on the Contract Drawings.

F. Where the edge joins the bare floor, taper the material from the full thickness to the height of the floor over a minimum of a 6-inch wide area.

G. Where the epoxy floor covering meets a wall insulating panel, the floor covering shall completely fill any gap to a minimum thickness of 1/4 inch.

H. Installation Tolerance: Limit variation in flooring surface from level to 1/4 inch in 10 feet; noncumulative.

3.04 FIELD QUALITY CONTROL

A. [Field Testing and Inspection]

3.05 REPAIR

A. Cut out and replace flooring areas that evidence lack of bond with substrate. Cut out flooring areas in panels defined by strips and replace to match adjacent flooring, or repair panels according to manufacturer's written instructions, as approved by Resident Engineer.

B. If flooring fails to provide levels of electrical insulation specified in Section 34 21 16.11 - Traction Power Substation Testing, apply additional layers of epoxy until specified levels are achieved.

END OF SECTION

SECTION 09 96 00

HIGH-PERFORMANCE COATINGS

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for furnishing and applying high performance coating systems in the shop and field on certain items and types of work, as scheduled, including surface preparation, primer coats, intermediate coats, finish coats, field touch-up, and related thinners and associated materials. Coatings used in the systems specified in this Section include:

a. HPC-1: High-Performance Coating for Exposed Concrete and Concrete Unit Masonry: High-build epoxy primer and finish coats.

b. HPC-2: High-Performance Coating for Exposed Primed Structural and Miscellaneous Steel, exposed cast-iron piping including guideway systems exposed to public view: High solids zinc-rich epoxy/acrylic urethane.

c. HPC-3: High-Performance Coating for Exposed Galvanized Structural Steel and Hollow Metal Doors and Frames: High-build aliphatic acrylic polyurethane.

d. HPC-4: High-Performance Coating for Exposed Aluminum Metal: Factory High-performance Fluoropolymer (Polyvinylidene Fluoride or PVDF) coatings with clear top coat.

e. HPC-5: High-Performance Coating to Separate Dissimilar Metals: and where coal tar epoxy is specified in other Sections of the Contract Documents.

f. HPC-6: High-Performance Zinc-rich Primer for field touch-up and spot repair and locations specifically indicated to receive primer only.

g. HPC-7: High-Performance Coating for Exposed Metal for Rail Potential Electrical Isolation: High Solid Epoxy Coating with UV Stable Coating.

h. Other High-Performance Coatings as described in this Section.

1.02 REFERENCES

A. This Section incorporates by reference the current versions of the following documents:

1. American Architectural Manufacturers Association (AAMA):

a. AAMA 605 - Voluntary Specification, Performance Requirements and Test Procedures for Superior Performing Organic Coatings on Aluminum Extrusions and Panels.

2. American Association of State Highway and Transportation Officials (AASHTO):

a. AASHTO M298 - Standard Specification for Coatings of Zinc Mechanically Deposited on Iron and Steel.

3. ASTM International:

a. ASTM B117 - Standard Practice for Operating Salt Spray (Fog) Apparatus.

b. ASTM C1028 - Standard Test Method for Determining the Static Coefficient of Friction of Ceramic Tile and Other Like Surfaces by the Horizontal Dynamometer Pull-Meter Method.

c. ASTM D256 - Standard Test Methods for Determining the Izod Pendulum Impact Resistance of Plastics.

d. ASTM D257 - Standard Test Methods for DC Resistance or Conductance of Insulating Materials.

e. ASTM D523 - Standard Test Method for Specular Gloss.

f. ASTM D695 - Standard Test Method for Compressive Properties of Rigid Plastics.

g. ASTM D790 - Flexural Properties Testing.

h. ASTM D822/D822M - Standard Practice for Filtered Open-Flame Carbon-Arc Exposures of Paint and Related Coatings.

i. ASTM D968 - Standard Test Methods for Abrasion Resistance Organic Coatings by Falling Abrasive.

j. ASTM D2240 - Standard Test Method for Rubber Property—Durometer Hardness.

k. ASTM D2244 - Standard Practice for Calculation of Color Tolerances and Color Differences from Instrumentally Measured Color Coordinates.

l. ASTM D3359 - Standard Test Methods for Measuring Adhesion by Tape Test.

m. ASTM D3361/D3361M - Standard Practice for Unfiltered Open-Flame Carbon-Arc Exposures of Paint and Related Coatings.

n. ASTM D4214 - Standard Test Methods for Evaluating the Degree of Chalking of Exterior Paint Films.

o. ASTM D4541 - Standard Test Method for Pull-Off Strength of Coatings Using Portable Adhesion Testers.

4. MPI – Master Painters Institute Architectural Painting Specification Manual: For application procedures.

5. Society for Protective Coatings (SSPC):

a. SSPC - SP 1 Solvent Cleaning.

b. SSPC - SP 2 Hand Tool Cleaning.

c. SSPC - SP 3 Power Tool Cleaning.

d. SSPC - SP 6 Commercial Blast Cleaning.

e. SSPC - SP COM Surface Preparation Commentary Steel and Concrete Substrates.

1.03 SUBMITTALS

A. Submit complete high performance coating system submittals for all iron and steel work prior to or in conjunction with the steel shop drawings to assure compatibility between steel shop primer and intermediate and finish high performance coatings. This submittal will not be considered complete and acceptable if either product is not compatible with each other.

B. Product Data: Submit data on coating system, including:

1. Manufacturer’s name, product name and/or catalog number, and general product category (e.g., “alkyd enamel”).

2. MPI product number (e.g.,”MPI #47”).

3. Cross-reference to specified coating system(s) product is to be used in; include description of each system.

4. Coating manufacturer’s most current technical data sheets on each product showing application procedures, coverage rates and dry mil thicknesses.

5. Additive requirements for Low-Temperature application.

C. Samples: Using approved materials, submit samples of finish coat, illustrating colors, gloss and finishes selected. For each separate color, prepare sample with exposed portions of each successive coat, on required number of 8-inch by 10-inch card stock draw-downs and one 12-inch by 12-inch sample of each color on substrate material matching work to be finished, or sheet metal which shall be representative of the in-place steel substrates. Label samples with color number, name and date. Provide samples of each color as indicated using complete coating system by application method proposed for the finish Work. Submit additional samples if required for approval. Provide samples of both the thermo-curing and air drying PVDF coatings.

D. Mockup for HPC-2 and HPC-3, In Place: Provide a full-size, 10-foot minimum height mockup of an exterior structural column to serve as the standard for the work of this Section. Comply with the following:

1. Application of materials shall be performed using same materials, methods, and procedures to be used throughout the balance of the Work.

2. Mock up shall incorporate specified surface preparation, including field touch-up of welds and abrasions with specified primer, tie/intermediate, as required, and finish top coatings, including Low-Temperature additive as proposed in the finish Work, as applicable.

3. Resident Engineer will direct location and extent of exterior structural steel column to be coated.

4. Notify Resident Engineer in advance of dates and times when mockup shall be completed.

5. Resident Engineer’s review and approval of mock up shall include, but not necessarily be limited to:

a. Uniformity in color, gloss, texture, and hide characteristics of high-performance finish.

b. Applicator's ability to provide continuous film of uniform thickness, free from surface imperfections which show evidence of poor workmanship or the coating's inability to be applied in the proposed application method.

6. Obtain Resident Engineer's approval of mockup before starting High-Performance Coatings.

7. If the Resident Engineer determines that mockup does not meet requirements for accepted appearance, repaint using revised methods.

8. Approved mockup may become part of the completed Work, if maintained undisturbed at time of Acceptance.

E. Manufacturer's Installation Instructions: Indicate special surface preparation procedures and perimeter conditions requiring special attention.

F. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

G. Certification:

1. By manufacturer that all paints and coatings do not contain any of the prohibited chemical specified; GreenSeal GS-11 shall constitute acceptable certification or per LEED certification VOC limit requirements, as applicable.

H. Applicators Quality Control procedures for shop and field painting and coating.

I. Manufacturers and applicators qualifications, per Article 1.06, herein: For all coating systems.

J. Field Quality Control Reports.

K. Maintenance Data: Submit data on cleaning, touch-up, and repair of painted and coated surfaces.

L. Warranties: Provide each warranty listed.

M. LEED Submittals:

1. Where LEED certification is required by the project, submit the same documentation for approval as required by GBCI as a project submittal. Highlight the relevant LEED information.

2. LEED documentation is to be submitted separately and titled LEED SUBMITTAL.

3. Building Product Disclosure and Optimization credit data: Submit data to support the LEED SUBMITTAL.

1.04 MAINTENANCE MATERIAL SUBMITTALS

A. Color Mix Formula: In lieu of extra stock materials, submit a single submittal including the following:

1. Mix formula for each color, in measured increments of 48ths of an ounce.

2. Paint manufacturer, color, and identification number.

3. Manufacturer of base.

4. Five color chips of each color.

5. Location list of where each color was applied.

1.05 QUALITY ASSURANCE

A. Manufacturer Qualifications: Company specializing in manufacturing the products specified in this Section with minimum three years documented experience.

B. Applicator Qualifications: Company specializing in performing the Work of this section with 3 years minimum documented experience; has completed paint applications similar in magnitude to that indicated for this Project; and is acceptable to the manufacturer for all coating systems. Only skilled painters shall be used with 5 years minimum painting experience and 3 years minimum experience using similar opaque aesthetic coating products by similar application methods.

C. Undivided Responsibility: The shop-applied primer applied in related sections may be produced by a different manufacturer than that of the intermediate and top coatings. The intermediate and top coatings shall be produced by a single manufacturer. Application of a High-Performance Coating system using different manufacturer's primer and intermediate and top coat products is acceptable only in the case of the manufacturer of the intermediate and the top coat products accepting undivided responsibility for the quality and durability of the system application by providing the following:

1. Written confirmation, on the manufacturer’s letterhead, of the compatibility of all products used in the High-Performance Coating System.

2. Written assumption of undivided responsibility, by the intermediate and top coat manufacturer, for the entire High Performance Coating system application’s performance, inclusive of primer, intermediate and top coat products.

3. Warranty for High Performance Coating System, as specified in Article 1.08, herein.

D. Pre-Application Conference: Schedule a Readiness Review Meeting to review the work prior to providing the mock up. Conference shall be attended by Applicator, authorized representative of coating manufacturer, Resident Engineer, and other representatives directly concerned with the performance of work. The following major considerations shall be reviewed at conference:

1. Inspect shop-primed steel for undercutting or all other signs of failure.

2. Inspect concrete surfaces for contamination or other conditions detrimental to coating application.

3. Discuss scaffolding and staging requirements.

4. Review surface preparation and cleaning requirements.

5. Review schedule, sequencing, and time lapse between each separate coat. Discuss re-coat time limits as established by manufacturer.

6. Review methods and materials which are to be used for protection of surrounding buildings and to contain over-spray and falling paint spatter.

7. Discuss environmental conditions, including temperature, relative humidity, wind conditions, sun exposure, and presence of air-borne contaminates under which materials may not be applied.

8. Review quality control procedures, which will be employed in determining the daily environmental conditions, containment, and disposal; include a list of those instruments, which will be used.

9. Review forecasted weather conditions, and procedures for coping with unfavorable conditions: tenting, heat, mechanical ventilation, etc.

1.06 PROJECT CONDITIONS

A. Environmental Requirements: During field application or field touch-up comply with the following:

1. Air temperature and substrate temperature and relative humidity shall be within the manufacturer's established limits. Field apply coating only when the temperature of the surfaces to be coated and surrounding air temperature are above 55 degrees Fahrenheit as verified and documented and are expected to remain so until the coating has fully dried or cured, unless other temperature limits are permitted by manufacturer's printed instructions.

2. Do not apply coatings when the following conditions exist unless requirements of paint manufacturer are more restrictive:

a. If surface and ambient temperature is above 90 degrees Fahrenheit, or below 55 degrees Fahrenheit.

b. Do not apply coatings in snow, rain, fog or mist, or when air-borne contaminants are high enough to spoil the paint, or when the relative humidity exceeds 85 percent; or at temperatures currently or potentially falling less than 5 degrees Fahrenheit above the dew point; or to damp or wet surfaces, during inclement weather, or during excessively windy weather.

3. Allow wet or damp surfaces to dry thoroughly and attain the temperature and condition specified before proceeding with or continuing coating applications.

4. Work may continue during inclement weather only if areas and surfaces to be coated are enclosed and the temperature and humidity within the area can be maintained with limits specified as above and per the manufacturer during application and curing periods.

5. Field-applied coatings which, in the judgment of the Resident Engineer, are applied under improper conditions or which do not meet quality control standards shall be appropriately removed and reapplied at no additional cost to Sound Transit.

6. Provide lighting level of 80-foot candles measured mid-height at substrate surface.

7. Restrict traffic from area where coating is being applied or is curing.

8. Protection: Protect surrounding areas, buildings, and cars against damage due to cleaning operations and from paint application. Method of protection is at Contractor's option and shall be reviewed with the Resident Engineer prior to starting the Work. Sound Transit will not be responsible for Contractor's selection or method of protection or failure to protect. Protective coverings shall be secured against wind and shall be vented to prevent collection of moisture on covered surfaces.

9. Provide "wet paint" signs as required to protect newly painted surfaces.

10. Any portions of the surrounding areas, which are damaged as a result of Contractor's activities, shall be restored, refinished, and replaced at Contractor's expense.

1.07 DELIVERY, STORAGE & HANDLING

A. Deliver materials to site in sealed, original, labeled containers bearing manufacturer's name, type of material, brand name, color designation, and instructions for mixing and thinning.

B. Store materials when not in actual use in a place specifically assigned for that purpose which is dry and out of direct sunlight. Store materials in a manner so as not to exceed the manufacturer's temperature limitations.

1.08 WARRANTY

A. The warranty for each coating system shall be countersigned by both the coatings manufacturer for materials, and by the applicator for workmanship. Warranty shall cover all components used in the specific combination for each coating system.

B. Correct Defective Work within a 5-year period beyond substantial completion.

C. Warranty: Include coverage for bond to substrate.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. Performance Requirements for HPC-1, HPC-2, HPC-3, HPC-4, and HPC-8:

1. Provide coating systems that meet the following minimum performance criteria, unless more stringent criteria are specified:

a. Abrasion resistance: 65, when tested in accordance with ASTM D968.

b. Adhesion: No pick-off, when tested in accordance with ASTM D3359 Cross Cut Tape Test.

c. Salt spray resistance: No field blisters, Max 1/32-inch creepage on scribe, when tested in accordance with ASTM B117 five percent Salt-Fog, 1000 hours.

d. Chalking: Maximum rating 8 for colors, 6 for whites, in accordance with ASTM D659.

e. Accelerated Weathering:

1) 60/60 cycle, 500 cycles, in accordance with ASTM D3361/D3361M, with chalk rating between 9 and 10 in accordance with ASTM D4214, and Color Change no more than 10 delta E units in accordance with ASTM D2244, and Gloss Retention of min. 6 0 percent in accordance with ASTM D523.

2) 5000 hours, in accordance with ASTM D822/D822M, with chalk rating of 8 to 10 in accordance with ASTM D4214, and color change of less than 5 delta E units in accordance with ASTM D2244, and 60 percent gloss retention in accordance with ASTM D523.

f. Coating at structural connections:

1) Faying surfaces and interiors of bolt holes for bolted structural steel connection in steel that is coated under this Section shall

receive only primer prior to erection. Primer shall meet or exceed slip coefficient requirements for fully coated connections from AISC for buildings and AASHTO for bridges and tunnels.

2) Provides Class B faying surface of slip-critical joints in accordance with ASTM C1028.

3) Additional requirements:

a) Solids by Volume: Minimum 63 percent.

b) Minium Zinc by weight in cured film: 82 percent.

c) Minimum net weight per gallon: 23 pounds.

B. Performance Requirements for HPC-5:

1. Abrasion resistance: 65, when tested in accordance with ASTM D968.

2. Adhesion: (ASTM D3359) at 14 days: 4A.

3. Salt spray resistance: No field blisters, Max 1/32-inch creepage on scribe, when tested in accordance with ASTM B117 five percent Salt-Fog, 1000 hours.

4. VOC content where used inside the building envelope: < 100 g/L.

C. Performance Requirements for HPC 6:

1. Demonstrated compatibility with HPC-2 and HPC-3 top coatings, and compatibility with existing shop-applied coatings and primers where used as touch-up primer.

2. Must meet requirements of the specified HPC-1, HPC-2, HPC-3, and HPC-4 system when used as touch-up primer.

3. Coating at structural connections:

a. Faying surfaces and interiors of bolt holes for bolted structural steel connection in steel that is coated under this Section shall receive only primer prior to erection. Primer shall meet or exceed slip coefficient requirements for fully coated connections from AISC for buildings and AASHTO for bridges and tunnels.

b. Provides Class B faying surface of slip-critical joints in accordance with ASTM C1028.

c. Solids by Volume: Minimum 63 percent.

d. Minium Zinc by weight in cured film: 82 percent.

e. Minimum net weight per gallon: 23 pounds.

D. Performance Requirements for HPC-7:

1. Provide coating systems that meet the following minimum performance criteria, unless more stringent criteria are specified:

a. Adhesion: > 300 PSI to Metal, when tested in accordance with ASTM D4541.

b. Flexural Strength: >7000 PSI, when tested in accordance with ASTM D790.

c. Hardness: > 84 when tested in accordance with ASTM D2240.

d. Compressive: > 6600 PSI, when tested in accordance with ASTM D695.

e. Electrical Properties: Surface resistivity > 5 Mohm, when tested in accordance with ASTM D257.

f. Impact Strength: > 2.66 ft.lb. /in^2, when tested in accordance with ASTM D256.

g. Tensile Strength: > 2000 PSI, when tested in accordance with ASTM D 638.

h. For outdoor application, the coating must provide UV resistant/ stable.

i. Slip resistant.

j. Properties not affected by deicer.

k. Water resistant.

l. Coatings must be considered noncombustible as defined by NFPA 130 where applied in a manner or to an extent that would present a fire hazard per NFPA 130.

2.02 MANUFACTURERS

A. Subject to compliance with requirements of Quality Assurance Article herein.

B. Paint systems listed are Basis of Design. Other manufacturer's systems are acceptable if approved equal in writing by Sound Transit. Requests for consideration of equal products must include adequate information to demonstrate comparable performance.

2.03 MATERIALS

A. General: Provide complete multi-coat systems formulated and recommended by manufacturer for the applications indicated, in the thicknesses indicated. Number of coats specified does not include filler coats.

B. Maximum volatile organic compound (VOC) content: As limited by applicable regulations of Authority Having Jurisdiction and the Sustainability Checklist or project LEED requirements, whichever is more restrictive.

C. Colors: As indicated in the Contract Documents.

D. Sheen: Finish coats shall have semi-gloss sheen.

E. Coatings: Numbers of Coats and total dry film thicknesses (dft) listed provide a range of acceptable coatings. Apply coats as required to achieve specified dft. Do not exceed maximum dft values.

F. Thinners: Type as supplied or approved by the coating manufacturer. Use thinner only when recommended by the coating manufacturer, and then only in a quantity as indicated on the label.

G. HPC-1:

1. Concrete, Opaque, 2 Coats min.:

   a. Tnemec Coatings Co:

      1) Two Coats: Enviro-Crete, Series 156 modified Acrylate Elastomer, by Tnemec Company, Inc. Apply to 6-8 mil dry film thickness.

   b. PPG:

      1) First Coat: Perma-Crete 100 percent Acrylic High Build Interior/Exterior Flat, 4-22XI. 3.2 – 5.8 DFT.

      2) Finish Coat: Perma-Crete PITT-FLEX Elastomeric Coating – Smooth, 4-110XI. 5.4- 7.2 DFT.

   c. Sherwin Williams:

      1) First Coat: Loxon XP.

      2) Finish Coat: Loxon XP.

2. Concrete Unit Masonry, Opaque, 3 Coats min.:

   a. First Coat:

      1) Tnemec 1254 Epoxoblock filler. Apply to 15-25 mil dry film thickness.

      2) PPG: Perma-Crete Concrete Block & Masonry Surfacer/Filler, 4-100XI. 8.0- 11.0 DFT.

      3) Sherwin Williams: PI Heavy Duty Block Filler.

   b. Second Coat:

      1) Tnemec Series 156 “Enviro-crete.” Apply to 5-6 mil dry film thickness.

      2) PPG: PITT-FLEX Elastomeric Coating – Smooth, 4-110XI. 5.4-7.2 DFT.

      3) Sherwin Williams: Loxon XP.

   c. Third Coat:

      1) Tnemec Series 156 “Enviro-crete.” Apply to 5-6 mil dry film thickness.

      2) PPG: PITT-FLEX Elastomeric Coating – Smooth, 4-110XI. 5.4-7.2 DFT.

      3) Sherwin Williams: Loxon XP.

H. HPC-2:

1. Type: Zinc Rich Primer/HB Epoxy/Acrylic Polyurethane.

2. Number of Coats: 3 Coats Min.

3. Total Dry Film Thickness: 11-15 mils dft.

4. Surface Preparation: SSPC - SP 6.

5. Primer: Zinc-Rich Urethane Primer, 3 mils dft.:

   a. PPG: Amercoat 68 HS VOC; 2.0-5.0 DFT.

   b. Tnemec Series 90-97 Tneme-Zinc or 394 PerimiPrime.

   c. Sherwin Williams: Corothane I Galva-Pac Zinc (B65G11).

6. Intermediate: High-Build Epoxy, 4 mils dft.:

   a. PPG: Amerlock 2VOC, High Solids Epoxy; 4.0- 8.0 DFT.

   b. Tnemec Series 27 F.C. Typoxy.

   c. Sherwin Williams: Macropoxy 646 B58 Series.

7. Finish: Aliphatic Acrylic Polyurethane, 4 mils dft.:

   a. PPG: Amershield VOC, 3.0-5.0 DFT.

   b. Tnemec Endura-Shield Series 750 UVX.

   c. Sherwin Williams: Acrolon 218 B65 Series.

      1) Low VOC for interior locations: PI WB Acrolon 100 B65 Series.

I. HPC-3:

1. Type: HD Galvanized / Recoatable Epoxy/Hi-Solids Polyurethane, 3 Coats Min. over galvanizing.

2. Total Dry Film Thickness: 11 – 17 mils dft. Over galvanizing.

3. Galvanizing: in accordance with Section 05 05 13 - Shop-Applied Coatings for Metal.

4. Coating Surface Preparation: SSPC - SP 16.

5. Primer: 1 Coat min, Recoatable Epoxy/ Hi-Solids Polyurethane, 3-5 mils dft.:

   a. PPG: Amerlock 400 VOC, High Solids Epoxy; 4.0- 8.0 DFT.

   b. SW: Macropoxy 646 B58 Series.

6. Finish: 2 Coats min., Hi-Solids Aliphatic Acrylic Polyurethane, total 4-6 mils dft.:

   a. PPG: Pitthane Ultra LS Acrylic Aliphatic Urethane, 95-812, 2.0-3.0 DFT.

   b. SW: Acrolon 218. Apply to 2-3 mils dft. per coat.

J. HPC-4:

1. Shop / Factory-Applied Thermocured PVDF Resin Based Coating on prepared substrate: A high performance thermoplastic, organic coating containing a minimum of 70 percent PVDF by weight in the resin system.

2. PVDF Coatings: Apply 3-coat coil coating consisting of 1 coat inhibitive primer, 1 coat PVDF color coating, and 1 coat PVDF clear topcoat.

3. Clean the substrate metal in accordance with manufacturer’s recommendations in the handling and application of the specified product and all compatible primers.

4. The substrate shall be primed in accordance with the manufacturer's recommendations for the substrate material, including chemical conversion coating, if required. Minimum thickness as recommended by the manufacturer for the primer and substrate.

5. Apply and oven-bake the color coat(s) to minimum thickness of 0.8 mil per coat, in accordance with manufacturer's written procedures.

6. Apply and oven-bake clear top coat to minimum thickness of 0.4 mil, in accordance with manufacturer's written procedures.

7. Air-Drying PVDF Resin Based Touch-up Coating: A high performance thermoplastic, organic coating containing a minimum of 70 percent PVDF by weight in the resin system to be used for maintenance and touch-up applications in field:

   a. Apply as touch-up application to shop / factory-applied PVDF finishes.

8. Products:

   a. PPG:

      1) Factory Applied Extrusion Coatings:

         a) PPG UC51742 Primer or Equal, as required by substrate.

         b) Duranar XL Color Topcoat. Dry Film Thickness, ASTM D 7091: 0.20 mil primer coat plus, 1.0 mil color coat and 0.4 mil clear topcoat or Duranar XL clear topcoat, 1.6 mil total minimum thickness three-coat system.

      2) Coil Coatings: PPG Duranar XL, Duranar GR. Dry Film Thickness, ASTM D 7091: 0.15 mil primer coat plus 0.70 mil color coat and 0.45 mil clear topcoat or Duranar GR clear topcoat, 1.3 mil total minimum thickness [three-coat system].

      3) Air Drying PVDF: Coraflon® ADS, or Equal as required by substrate and finish.

   b. Sherwin Williams:

      1) Fluropon 70 percent PVDF.

K. HPC-5:

1. Type: HB Cathodic-protection Epoxy coating, to isolate dissimilar metals, where recommended by envelope system manufacturers, and where coal tar epoxy is indicated elsewhere in the Contract Documents. Two coats, Min. high-build, two-part, SSPC - Paint 16 at locations detailed or where recommended by envelope system manufacturers. Manufacturer listed dry film thicknesses are to be used as a min. dft. for the system.

2. Products:

   a. PPG:

      1) PPG: Sigmashield 880, 6-40 mils DFT per coat.

2) Low VOC for interior locations: Amerlock 2 VOC @ 4-8 mils DFT.

b. Sherwin Williams:

1) Dura-Plate UHS Epoxy: 1 Ct. @ 18-22 mils DFT or 2 coats @ 10-12 mil DFT each.

c. SIKA: Sikaguard-62.

L. HPC-6:

1. Zinc-Rich Urethane Primer: SSPC Paint 40:

a. Number of Coats: 1 Coat min.

b. Total Dry Film Thickness: Match HPC system being repaired, or as required below for primer-only locations.

c. Surface Preparation: as required per Article 3.05: PROTECTION AND TOUCH-UP WORK .

d. Products:

1) PPG: Amercoat 68 HS VOC; 3.0-5.0 DFT.

2) Sherwin Williams: Corothane I Galva-Pac Zinc, 3.5 DFT.

3) Tnemec Series 90-97 Tneme-Zinc.

M. HPC-7:

1. Type: Epoxy and UV stable coating.

2. Number of Coats: Per manufacturer recommendation.

3. Total Dry Film Thickness: Per manufacturer recommendation.

4. Surface Preparation: Per Manufacturer recommendation.

5. Finish coat: Approved for UV protection per manufacturer recommendation.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Verify existing conditions before starting work.

B. Verify that substrate surfaces are ready to receive work as instructed by the coating manufacturer. Obtain and follow manufacturer's instructions for examination and testing of substrates. Coating applicator shall inspect the primed surfaces. Should inspection reveal any signs of primer failure, corrosion on substrate, conditions detrimental to the performance of this work, or window of recoat time has been exceeded, such failure and/or conditions shall be immediately reported to the Contractor. It shall be the Contractor's responsibility to see that the surfaces are put into acceptable condition.

C. Coating applicator shall be required to clean surfaces as hereinafter specified to remove all dust, dirt, and other surface contamination. Commencement of work constitutes acceptance of surfaces and conditions.

D. Cementitious Substrates: Do not begin application until substrate has cured 28 days minimum and measured moisture content is not greater than 16 percent.

E. Masonry: Verify masonry joints are struck smooth and mortar is fully cured.

3.02 SURFACE PREPARATION

A. General:

1. Surface preparations and cleaning procedures shall be in strict accordance with the instructions and specifications of the coating manufacturer and with the requirements herein.

2. Remove substances that would bleed through finished coatings. If not removable, seal surface with shellac.

3. Remove finish hardware, fixture covers, and accessories and store. Protect items that are not removable.

4. Cleaning and Touch-Up for abraded areas in field erection and fabrication shall be completed in conformance with manufacturer’s recommendations.

B. Cleaning of Shop-Primed Surfaces: Thoroughly clean steel surfaces to remove all rust, scale, dirt, grease, and other foreign material from surfaces, connections, bolts, nuts, and areas around welds surface oils and other contaminants. Clean surfaces using power washing equipment and non-phosphate, biodegradable chemical cleaner:

1. Field test on a small area to determine the most effective method (type of nozzle employed, operating pressure, and distance of nozzle from surface) to achieve maximum cleaning results without damaging or etching the existing primer.

2. After washing with cleaner, power wash surfaces thoroughly with fresh water under high pressure to remove all traces of the chemical cleaner.

C. Ferrous Metal:

1. Solvent clean.

2. Remove loose rust, loose mill scale, and other foreign substances hand tools according to SSPC - SP 2 or power tools according to SSPC - SP 3.

3. Protect adjacent surfaces and materials not receiving coating from overspray; mask if necessary to provide adequate protection. Repair damage.

D. Cleaning For Galvanized/Galvannealed Surfaces: Thoroughly clean steel surfaces to remove surface oils and other contaminants in accordance with SSPC - SP 1:

1. Follow manufacturer's additional requirements for the removal of soluble salts as may be required in accordance with SSPC - SP COM.

2. Ensure that all dirt, grease, oil, soil, drawing compounds, and organic compounds are fully removed from the surface prior to priming.

3.03 APPLICATION OF COATINGS

A. Mixing: Mix coating materials in accordance with the manufacturer's instructions and directions. Mix often enough during application to keep the coatings uniform and to ensure complete dispersion of pigment and a uniform composition:

1. Prepare multiple component coatings using all of the contents of the container for each component as packaged by the manufacturer. Mixing of partial kits will not be permitted. Multiple component coatings that have been mixed shall not be used beyond their pot life. Only the components specified and furnished by the manufacturer, including thinner if required, shall be mixed.

2. Intermediate coat primer may be thinned for spray applications, in accordance with manufacturer's most current printed technical data sheet.

3. Accelerator may be used in intermediate coat and finish coat to enable faster cure time during Low Temperature applications when approved by Resident Engineer; use accelerator type as supplied by the manufacturer, and then only in a quantity as indicated on manufacturer's most current printed technical data sheet.

B. Application Method: Apply both intermediate coat and finish coat in a full application method, in accordance with the manufacturer's most current printed technical data sheet. Use techniques best suited for substrate and type of material being applied:

1. Spray Application: Spray painting shall be accomplished with airless spray equipment or conventional spray equipment; pressure settings, application technique, spray tip, mesh filter screens, and mesh tip strainer shall be as recommended by the coating manufacturer for each separate system.

2. Apply each coat within the manufacturer's recommended recoating time periods. Should time period for application be exceeded, Contractor shall then follow manufacturer's most current printed technical data sheet which may include an additional prime coat or scarification at no additional cost to Sound Transit.

3. When applying paint, overlap each pass 50 percent followed by cross-hatch pattern.

4. During application of each coating, remove all foreign material from applicators (brush, rollers or pads) and protect wet surfaces from contamination of air borne dust and debris.

C. Apply each coat of paint as a continuous film of uniform thickness, free from holidays, sags, crawls, pinholes, blisters, unevenness in color, or other evidence of poor workmanship. Repaint thin spots or areas missed in the application and allow to dry before applying next coat of paint. Give special attention to ensure that surfaces, such as edges, corners, crevices, welds and exposed fasteners receive a dry film thickness equivalent to that of flat surfaces:

1. Coverage for paint material is specified for both the minimum and maximum dry film thickness in mils.

D. Maintain Cure Times: Provide full cure times necessary to resist direct contact with moisture. Comply with manufacturer's requirements and Contractor’s approved quality control procedures based on actual site conditions.

E. Priming:

1. Apply primer to all surfaces, unless specifically not required by coating manufacturer. Apply in accordance with coating manufacturer's instructions.

2. Concrete Unit Masonry: Apply masonry filler to thickness required to provide a smooth, monolithic, pinhole-free film surface with a minimum thickness of 30 mils.

F. Intermediate Coats:

1. Repair, and recoat any blisters, runs or sags in primer coat prior to application of intermediate coats.

2. Intermediate coats shall fully cover and hide primer coat.

G. Finish Coats:

1. Repair, and recoat any blisters, runs or sags in previous coats prior to application of finish coats.

2. Finish coats shall fully cover and hide intermediate coat.

3.04 FIELD QUALITY CONTROL

A. Dry Film Thickness Testing: Contractor shall engage the services of a qualified testing and inspecting agency to inspect and test coatings for dry film thickness.

B. Contractor shall touch-up and restore coated surfaces damaged by testing.

C. If test results show that dry film thickness of applied coating does not comply with coating manufacturer's written recommendations or these specifications, Contractor shall repair areas that does not meet quality standards to provide dry film thickness that complies with coating manufacturer's written recommendations and pay for re-testing.

3.05 PROTECTION AND TOUCH-UP WORK:

A. General: Before final acceptance of the Work, Contractor shall repair or re-finish coated surfaces which have been damaged at no additional cost.

B. Areas of chipped, peeled, or abraded coatings shall be hand or power sanded, feathering the edges. Prime and finish coat the areas using the same material as originally scheduled. Depending on the extent of repair and its appearance, an overall finish coat to a natural break point may be required by the Resident Engineer to achieve uniform appearance.

C. Field Repair of Zinc/Epoxy/Urethane Paint Systems:

1. Where damage is limited to the epoxy or urethane coatings, use hand tool cleaning in accordance with SSPC – SP 2 or power tool cleaning, in accordance with SSPC - SP 3, to visibly damaged areas. Feather edges by mechanical means. Spot prime with the epoxy and topcoat with the specified polyurethane.

2. For minor scratches to the polyurethane top coat, clean and scuff sand the damaged area and apply the polyurethane in accordance with manufacturer's recommendations.

3. Scratches, gouges, and other damaged areas where the substrate is exposed, spot field blast in accordance with SSPC - SP 6. Spot prime with organic zinc, followed by epoxy and urethane in accordance with Contract Specifications.

4. Solvent clean in accordance with SSPC - SP 1.

D. Field Repair of Factory-Applied PVDF Coating Systems:

1. Apply approved air-drying PVDF or other approved touch-up coatings in accordance with manufacturer's instructions, and AAMA 605.2 to thicknesses specified.

2. For minor scratches to the PVDF top coat, clean and scuff sand the damaged area and apply the air-drying PVDF coating in accordance with manufacturer's recommendations.

3. Apply in uniform thickness coats, without runs, drips, pinholes, brush marks, or variations in color, texture, or finish. Finish edges, crevices, corners, and other changes in dimension with full coating thickness.

4. Color and gloss of touch-up coating shall match exactly the color and gloss of the shop-applied coatings.

5. Apply PVDF touch-up coating to achieve a minimum thickness of 1.2 mil, including prime coat.

E. Coat connectors and disturbed surfaces to match adjacent surfaces. Field touchup work shall use the same sequence and thickness of coatings as specified for the original work. Touchup application efforts shall be done in accordance with the recommendations of the coating manufacturer, subject to acceptability to the Resident Engineer.

F. Coated assemblies shall be adequately protected from handling and shipping damage with the use of padded slings, dunnage, separators, tie downs, or other protective devices and methods. Use of bare cables is prohibited.

G. Protect work of this and other trades, whether to be coated or not, against damage from coatings and coating operations. Correct damage by cleaning, repairing, replacing, or recoating as acceptable to the Resident Engineer. Leave affected surfaces in undamaged condition. Touchup areas shall blend with finish coats. Additional touchup or an additional finish coat shall be required if there are visual imperfections, due to touchup work, as determined by the Resident Engineer, when viewed from a distance of 10 feet.

H. Continue protection, repair procedures, and touchup procedures as necessary so that coatings will be in an undamaged condition at the time of Acceptance.

3.06 CLEANING

A. General: During the progress of the work, remove from the project all discarded paint materials, rubbish, cans and rags. Leave premises clean and in orderly condition.

B. Collect waste material which may constitute a fire hazard, place in closed metal containers, and remove daily from site.

C. Clean surfaces immediately of overspray, splatter, and excess material.

D. After coating has cured, clean and replace finish hardware, fixtures, and fittings previously removed.

E. Cleaning: Upon completion of painting work, clean, restore, or replace, to the satisfaction of the Resident Engineer and at no expense to Sound Transit, all surfaces which have been damaged or surfaces which have been splattered.

END OF SECTION

SECTION 10 14 00

SIGNAGE

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for regulatory and facility signage for identification and instructions as required by the Authority having Jurisdiction (AHJ) and as outlined elsewhere in the contract documents, installed as complete integrated system from a single manufacturer.

2. System related signage and equipment tags when specified in system specifications are to be provided by system contractors.

B. Types of signs required by this work include, but are not limited to:

1. Exit Signs: To identity exits and exit access doors.

2. Stairs, Stairway Landings: To identify access, stair number, floor number and existence or absence of roof access.

   Elevator Machine Room Sign: To indicate room is for authorized personnel use only, (WAC 296-96).

3. Room Identification Signs.

4. Identification signs for confined spaces, access points, and other warning signs complying with AHJ.

5. Accessibility Signage: To indicate accessible parking stalls, areas of rescue assistance, loading zones, toilet facilities, and directional signage to accessible facilities.

6. Posting Maximum Room (Occupancy) Capacity: Provide room capacity sign for assembly rooms and individual spaces as indicated.

7. Posting Maximum Platform (Occupancy) Capacity: Provide capacity sign for platform.

C. All sign copy shall be as required by the various codes involved.

D. Types of room required signs shall be as listed in the SIGN SCHEDULE located in the drawings.

E. ST Customer Signage and Systems Operational Signage are not included in this Section.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. International Code Council, Inc. (ICC):

   a. Codes adopted by AHJ's and associated codes, including State of Washington amendments, as applicable. See Drawings for current code version.

   b. ICC A117.1.

2. Americans with Disabilities Act (ADA):

a. ADA Accessibility Guidelines (ADAAG).

3. American National Standards Institute (ANSI) / American Society of Mechanical Engineers (ASME):

a. ANSI Z535.2 – Environmental and Facility Safety Signs.

4. Washington State Legislature:

a. Washington Administrative Code (WAC).

1.03 SUBMITTALS

A. Submit:

1. Submit for review, before fabrication and after approval by the applicable code authorities, the following items for each type of sign to be provided in the Project:

a. Product Data: Manufacturer's information relating to the materials, finishes, and fasteners used in each type of sign.

b. Shop Drawings: Show type, size, color and thickness of typography, symbols, wording and attachment proposed for each type of sign.

c. Product Schedule: Include location plan showing the exact location for all signs being provided.

B. Transmit:

1. Warranty.

2. Product Data: Manufacturer's information relating to the materials, finishes, and fasteners used in each type of sign.

3. Installer Qualifications.

1.04 QUALITY ASSURANCE

A. Installer Qualifications: An authorized representative of signage manufacturer for installation and maintenance of units required for this Project.

B. For signs supported by or anchored to permanent construction, advise installers of anchorage devices about specific requirements for placement of anchorage devices and similar items to be used for attaching signs:

1. For signs supported by or anchored to permanent construction, furnish templates for installation of anchorage devices.

1.05 DELIVERY, STORAGE AND HANDLING

A. Handle signage in careful manner to prevent damage or marring of sign surfaces or adjacent finishes.

1.06 WARRANTY

A. Manufacturer’s Warranty: Provide (5) five-year limited warranty covering coating degradation, chalking, fading and delamination.

PART 2 - PRODUCTS

2.01 MANUFACTURER/FABRICATORS

A. Signage Manufacturers/Fabricators:

1. ASI.

2. Fast Signs.

3. Tube Art.

4. Or approved equal.

2.02 MATERIALS

A. Paint Colors: Comply with ANSI Z535.2:

1. Colors based on Matthews Paint:

a. Yellow: P4 MP31456.

b. Blue: ADA Blue MP00366.

c. Red: P3 MP00643.

d. Black: Black.

e. White: White.

2.03 MANUFACTURED PRODUCTS

A. All materials shall be new and free from defects upon completion of the Contractor's work. All materials shall be the products of manufacturers or suppliers with an established reputation for regularly engaged in the furnishing of such materials. All of the Contractor's work shall be performed with the highest degree of skill and completed in accordance with the Contract Documents.

B. Signs:

1. Material: Integral colored high impact UV resistant, colorfast, cast acrylic, nominal 1/8 inch thick with square corner and edges.

2. Type: Unframed.

3. Mounting Material: Wall or vertical surface as follows:

a. Interior: Double sided vinyl tape.

b. Exterior: Liquid adhesive as recommended by manufacturer, or mechanical fasteners as approved.

4. Copy Process: Tactile and Braille; photo-etched plastic and laminated to the insert face in one piece. Individually applied characters and Braille strips are expressly disallowed.

5. Copy and Color: Black, Blue, Red or Yellow as indicated in Appendix A SIGNAGE SCHEDULE.

6. Nominal Size: 8 inches by 10 inches, or as noted.

C. Tactile (ADA) And Non-Tactile Plaque Signs Interior Applications:

1. Tactile Signs: Faces shall consist of minimum 5/8-inch text in all caps. Text shall be raised a minimum of 1/32 inch above the surface of the sign panel. Grade 2 Braille shall be provided in a minimum dot height of .025 inch with inset round glass beads. Braille shall be separated .395 inch (10 mm) minimum from any other tactile characters. Adhesive-fixed characters are not acceptable.

2. Cleanability: Signs shall be cleanable with soap detergents and other similar non-abrasive cleaners without damage to the sign surface. Contractor shall provide complete cleaning instructions.

3. Mounting Material: Use foam tape in all interior areas.

2.04 FABRICATION

A. Typography shall comply with code requirements. All lettering shall be executed in such a manner that all edges and corners of the letter forms are correctly spaced, true, clean, and photographically precise and shall accurately reproduce the letter form.

B. Type face shall be Humanist 777 Bold Condensed, unless otherwise noted, upper and lower case, unless otherwise required by code:

1. Letter Spacing: Tracking = 25.

2. Color: Refer to 3.06 SIGNAGE SIGN TYPES for specific letter colors on backgrounds:

a. White letters on Black background.

b. Black letters on Yellow background.

c. White letters on Red background.

d. White letters on Blue background

e. Red letters on yellow background, unless otherwise indicated.

3. ADA Compliant: ICC A117.1.

2.05 SOURCE QUALITY CONTROL

A. Source Limitations: Obtain each sign type through one source from a single manufacturer.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Locate sign units and accessories where indicated, or directed by Resident Engineer using mounting methods of the type described and in compliance with the manufacturer's instructions:

1. Comply with ADAAG and ICC A117.1.

B. Install signs level, plumb, and at the height indicated, with sign surfaces free from distortion or other defects in appearance.

C. Signs shall be detailed to make all edges less vulnerable to prying or removal.

D. All plaque signs shall be flush mounted, leaving no space behind sign, and installed using tamper-proof fasteners.

3.02 REMOVAL

A. Remove construction debris from project.

B. After installation completion, remove temporary coverings and protection to adjacent work areas.

3.03 REPAIR

A. Repair scratches and other damage which might have occurred during installation. Replace components where repairs were made but are still visible to the unaided eye from a distance of 5 feet.

3.04 CLEANING

A. Clean installed products in accordance with manufacturer's instructions prior to Acceptance.

3.05 PROTECTION

A. Coordinate installation with adjacent finish materials in manner not to damage adjacent surfaces.

3.06 SIGNAGE SIGN TYPES

A. Schedule: Refer to Signage Schedule in the Drawings for sizes, locations, and layout of signage types, sign text copy, and graphics.

SECTION 10 28 00

TOILET AND CUSTODIAL ACCESSORIES

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for the following:

a. Accessories for toilet rooms and utility rooms.

b. Grab bars.

c. Plastic polycarbonate vandal-resistant mirrors for installation in toilets and utility rooms.

B. For non-ST facilities, Sound Transit will provide separate requirements for Toilet and Utility Room Accessories.

1.02 REFERENCES

A. This Section incorporates by reference the latest revision of the following documents:

1. Americans with Disabilities Act Accessibility Guidelines (ADAAG).

2. American National Standards Institute (ANSI):

a. ANSI ICC A117.1 - Accessible and Useable Buildings and Facilities.

b. ANSI Z97.1 - For Safety Glazing Materials Used in Buildings – Safety Performance Specifications and Methods of Test.

3. American Society for Testing and Materials International (ASTM):

a. ASTM A123/A123M - Standard Specification for Zinc (Hot-Dip Galvanized)Coatings on Iron and Steel Products.

b. ASTM A269 - Standard Specification for Seamless and Welded Austenitic Stainless-Steel Tubing for General Service.

c. ASTM A653/A653M - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.

d. ASTM A666 - Standard Specification for Annealed or Cold-Worked Austenitic Stainless-Steel Sheet, Strip, Plate, and Flat Bar.

e. ASTM B456 - Standard Specification for Electrodeposited Coatings of Copper Plus Nickel Plus Chromium and Nickel Plus Chromium.

f. ASTM F1178-11 - Standard Specification for Performance of Enameling System, Baking, Metal Joiner Work and Furniture.

1.03 SUBMITTALS

A. Product Data: Provide data on accessories describing size, finish, details of function, attachment methods.

B. LEED Submittals:

1. Where LEED certification is required by the project, submit the same documentation for approval as required by GBCI as a project submittal. Highlight the relevant LEED information.

2. LEED documentation is to be submitted separately and titled LEED SUBMITTAL.

3. Building Product Disclosure and Optimization credit data: Submit data to support the LEED SUBMITTAL.

C. Manufacturer's Installation Instructions: Indicate special procedures and conditions requiring special attention.

D. Manufacturer’s Certificate: Certify that mirrors meet or exceed specified requirements.

1.04 QUALITY ASSURANCE

A. All toilet and utility room accessories are required to comply with Sound Transit’s Design Standards, ADAAG and ANSI/ICC A117.1 and applicable building codes, unless otherwise indicated; in the event of conflicting requirements, comply with the most comprehensive and specific requirements.

1.05 COORDINATION

A. Coordinate accessory locations with other work to prevent interference with clearances required for proper installation, adjustment, cleaning, and servicing of accessories.

1.06 WARRANTY

A. Provide one (1) year warranty that manufacturer agrees to repair or replace toilet accessories that fail in materials or workmanship within specified warranty period excluding finish.

B. Provide five (5) year manufacturer warranty for reflective coating on mirrors and replacement of same.

PART 2 - PRODUCTS

2.01 SYSTEM DESCRIPTION

A. Coordination:

1. Coordinate the work with the placement of internal wall reinforcement and reinforcement of toilet partitions to receive anchor attachments.

2.02 MANUFACTURERS

A. Toilet Accessories, Staff Restrooms:

1. American Specialties, Inc.

2. Bobrick Washroom Equipment, Inc.

3. Bradley Corporation.

4. Zurn.

5. Acorn Engineering Company, Inc.

6. Truebro.

7. Duraclenz.

B. Toilet Accessories, Public Restrooms unless noted otherwise:

1. Duraclenz.

2.03 MATERIALS

A. Accessories - General: Shop assembled, free of dents and scratches and packaged complete with anchors and fittings, steel anchor plates, adapters, and anchor components for installation:

1. Grind welded joints smooth.

2. Fabricate units made of metal sheet of seamless sheets, with flat surfaces.

B. Keys: Provide two (2) keys for each accessory to Sound Transit; master key lockable accessories.

C. Stainless Steel Sheet: ASTM A666, Type 316.

D. Stainless Steel Tubing: ASTM A269, Type 316.

E. Galvanized Sheet Steel: Hot-dipped galvanized steel sheet, ASTM A653/A653M, with G90/Z275 coating.

F. Vandal-Resistant Polycarbonate Mirror: ANSI Z97.1; plastic compound, clear; mirrored coating; silicone abrasion resistant coating for scratch resistance.

G. Fasteners, Screws, and Bolts: Hot-dip galvanized, tamper-proof, security type.

H. Expansion Shields: Fiber, lead, or rubber as recommended by accessory manufacturer for component and substrate.

2.04 ACCESSORIES

A. Toilet Room Accessories:

1. TA-1: Toilet Paper (Roll) Dispenser (TPD): Double roll, surface mounted bracket type, satin finished cast aluminum brackets, eccentric-shaped plastic spindle for 1/2 revolution delivery designed to prevent theft of tissue roll:

a. Basis-of-Design Product: Bobrick, Model No. B2888, or approved equal.

b. Description: Double-roll dispenser.

c. Mounting: Surface-mounted.

d. Capacity: Designed for 4-1/2- or 5-inch- diameter tissue rolls.

e. Material and Finish: Stainless Steel, No. 4 finish (satin).

2. TA-2: Paper Towel Dispenser: Satin-finish stainless steel. Seamless beveled flange:

   a. Manufacturer: Duraclenz or approved equal.

   b. Description: Recessed Convertible Paper Towel Dispenser/Waste Receptacle.

   c. Mounting: Recessed.

   d. Capacity: 12 gallons.

   e. Material and Finish: Stainless Steel, No. 4 finish (satin).

3. TA-3: Soap Dispenser (SD): Liquid soap dispenser, wall-mounted, surface, for with stainless steel cover and horizontal stainless-steel tank and working parts; push type soap valve, check valve, and window gage refill indicator, tumbler lock:

   a. Basis-of-Design Product: Bobrick, Model No. B-4112, or approved equal.

   b. Description: Designed for dispensing soap in liquid or lotion form.

   c. Mounting: Vertically oriented, surface-mounted.

   d. Capacity: 40 oz.

   e. Lockset: Tumbler type.

   f. Refill Indicator: Window type.

4. TA-3A: Soap Dispenser (SD-VR): Automatic foaming soap dispenser, wall-surface mounted, stainless-steel construction, corrosion resistant, hidden cylinder lock.

5. Manufacturer: Duraclenz or approved equal:

   a. Description: Automatic Foaming Soap Dispenser in Protective Case.

   b. Mounting: Vertically oriented, surface-mounted.

   c. Capacity: 1200 ml Pre-packaged foaming soap.

   d. Hardware: Manufacturer’s recommended mounting hardware for vandal resistance.

   e. Lockset: Cylinder type, hidden and secure.

   f. Material and Finish: 12-gauge Type 316L Stainless Steel, No. 4 finish (satin).

6. TA-4: Mirrors (MIR): Polycarbonate Vandal-Resistant Mirrors:

   a. Manufacturer: Duraclenz or approved equal.

   b. ANSI Z97.1; plastic compound, clear; mirrored coating; silicone abrasion resistant coating for scratch resistance; stainless steel frame all-around:

      1) Size: 24-inch x 36-inch.

2) Thickness: 0.236-inch.

3) Mirror Adhesive: Chemically compatible with mirror coating and wall substrate.

7. TA-5: Seat Cover Dispenser (SCD): Stainless steel, surface-mounted, reloading by concealed opening at base, tumbler lock:

   a. Basis-of-Design Product: Bobrick, Model No. B-221, or approved equal.

   b. Mounting: Surface mounted.

   c. Minimum Capacity: 250 seat covers.

   d. Exposed Material and Finish: Stainless steel, No. 4 finish (satin).

   e. Lockset: Tumbler type.

8. TA-6: Grab Bars (GB): Stainless steel, 1-1/2 inches outside diameter, minimum:

   a. 0.05-inch wall thickness, nonslip grasping surface finish, concealed flange mounting; 1-1/2 inches clearance between wall and inside of grab bar.

   b. Basis-of-Design Product: Bobrick, Model No. B-5806, or approved equal.

   c. Mounting: Flanges with concealed fasteners.

   d. Material: Stainless steel, 18-gauge thick:

      1) Finish: Smooth, No. 4, satin finish on ends and slip-resistant texture in grip area.

   e. Outside Diameter: 1-1/4 inches.

   f. Configuration and Length: As indicated on Issued for Construction Drawings.

9. TA-7: Surface-Mounted Electric Hand Dryer (EHD):

   a. Basis-of-Design Product: Sloan – Xlerator, or approved equal.

   b. Description: Surface Mounted, 10 second dry speed, energy efficient.

   c. Mounting: Surface mounted.

   d. Voltage: 208- 240 volts AC, 1.7 – 5.0 -Amp, 400-1200 Watts, 50/Hz, single phase.

   e. Color/Finish: Stainless-steel, brushed finish.

   f. Cover Material: One-piece, minimum 16-gauge, Type 304 stainless-steel.

   g. Electrical Work Description: Provide wiring, power connection and load testing under work of low-voltage electrical power conduits and cables as stated elsewhere in the Contract Documents.

10. TA-8: Combination Sanitary Napkin/Tampon Vendor (SNV): Stainless-steel:

    a. Basis-of-Design Product: or approved equal.

        1) Surface-mounted: Bobrick Model No. B-47069C, ConturaSeries.

        2) Recessed: Bobrick Model No. B-4706C, ConturaSeries.

    b. Door: Seamless 18-gauge (0.05 inch) door with returned edges and tumbler lock.

    c. Cabinet: Fully welded, 18-gauge (0.05 inch) thick stainless-steel sheet.

    d. Operation: The dispensers shall not require payment for operation.

    e. Identify dispenser's slots without using brand names.

    f. Minimum capacity: 20 napkins and 30 tampons.

11. TA-9: Sanitary Napkin Receptacle Unit (SNR):

    a. Manufacturer: Duraclenz or approved equal:

        1) Heavy gage stainless steel, recessed type, with all-welded construction.

        2) Door shall be 20-gauge (0.38-inch) stainless steel, satin finish with a magnet catch and cable door-swing limiter, removable receptacle.

12. TA-10: Undersink Anti-Burn Protection (UBP): Drain piping and angle valve supply cover insulation for ADA/Barrier-Free Facility compliance:

    a. Basis-of-Design Product: Lav Guard 2 manufactured by Truebro, Inc.; or approved equal.

    b. Material: Anti-microbial, molded, closed cell vinyl covers:

        1) 1/8-inch nominal wall thickness; 70-80 Shore A hardness.

        2) Finish: Smooth, high gloss.

        3) Color: To be selected from manufacturer's standard colors by Resident Engineer.

13. TA-11: Surface Mounted Waste Receptacle (SMWR): Projecting waste receptacle, stainless steel:

    a. Basis-of-Design Product: Bobrick Model No. B-277, or approved equal.

    b. Description: Surface-mounted Waste Receptacle with reusable, heavy-duty waste receptacle liner.

    c. Mounting: Surface-mounted.

    d. Capacity: 12.75 gallons.

    e. Material and Finish: Stainless-steel, No. 4 finish (satin)

B. Utility Rooms Accessories:

1. Combination Utility Shelf/Mop and Broom Holder (MH):

a. Basis-of-Design Product: Bobrick, Model No. B-239 x 34, or approved equal.

b. Description: Unit with shelf, holders, and rod suspended beneath shelf.

c. Length: 34 inches.

d. Material and Finish: Stainless steel, No. 4 finish (satin):

1) Shelf: Not less than 18-gauge (nominal 0.05-inch) thick stainless steel.

e. Hooks: 4, 12-gauge (0.11 inch) stainless steel rag hooks under shelf.

f. Mop/Broom Holders: 3 under shelf.

2.05 FINISHES

A. Stainless Steel: No. 4 satin brushed finish, unless otherwise noted.

B. Chrome/Nickel Plating: ASTM B456, SC 2, satin finish, unless otherwise noted.

C. Baked Enamel: Comply with ASTM F1178-11. Minimum one (1) coat primer and minimum two (2) coats epoxy baked enamel.

D. Galvanizing for Items Other than Sheet: Comply with ASTM A123/A123M; galvanize ferrous metal and fastening devices.

E. Back paint components where contact is made with building finishes to prevent galvanic corrosion.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Verify existing conditions before starting work.

B. Verify exact location of accessories for installation.

C. Verify that blocking, reinforcing plates, and concealed anchors are installed in walls and ceilings.

3.02 PREPARATION

A. Deliver inserts and rough-in frames to site for timely installation.

B. Provide templates and rough-in measurements as required.

C. Clean surfaces to receive accessories. Protect surrounding elements from damage during accessory installation.

3.03 INSTALLATION

A. Install accessories in accordance with manufacturers' instructions.

B. Install plumb and level, securely and rigidly anchored to substrate.

C. Mounting Heights and Locations: As required by accessibility regulations and as indicated on Issued for Construction Drawings.

D. Mirrors:

1. Install mirrors in accordance with manufacturers' recommendations.

2. Set mirror plumb and level, free of optical distortion.

3. Set mirrors with edge clearance free of surrounding construction including countertops or backsplashes.

3.04 ADJUSTING

A. Adjust accessories as required to provide smooth operation and trouble-free servicing.

3.05 CLEANING

A. Remove labels after Work is complete, prior to cleaning.

B. Clean and polish exposed surfaces of accessories using accessory manufacturer's recommended procedures and cleaning agents.

3.06 PROTECTION

A. Provide coverings as required to protect installed accessories.

B. After installation of mirrors, mark pane with an 'X' by using removable plastic tape or paste.

END OF SECTION

SECTION 10 44 00

FIRE PROTECTION SPECIALTIES

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for the following:

a. Fire extinguishers:

1) FE-1: Multipurpose dry chemical for general use, bracket-mounted unless noted otherwise. Size varies by location and travel distance. See ST Requirements Manual set 601 for layout criteria.

2) FE-2: B-C dry chemical for electrical rooms, bracket-mounted unless noted otherwise.

3) FE-3: Carbon Dioxide Type, bracket-mounted unless noted otherwise.

b. Fire extinguisher cabinets:

1) FEC-1: Semi-Recessed Outdoor Cabinet with FE-1.

2) FEC-1a: Surface-Mounted Outdoor Cabinet with FE-1.

3) FEC-2: Fire-rated semi-recessed cabinet with FE-1.

4) FEC-3: Non-rated surface mounted cabinet with FE-2.

5) FEC-4: Fire-rated surface-mounted cabinet with emergency microphone.

c. Emergency responder equipment cabinet (EREC).

d. Accessories.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. National Fire Protection Association (NFPA):

a. NFPA 10 - Standard for Portable Fire Extinguishers.

2. Underwriters Laboratories Inc. (UL):

a. UL Fire Protection Equipment Directory.

1.03 SUBMITTALS

A. Product Data: For each type of product indicated - Include rating and classification, material descriptions, dimensions of individual components and profiles, and finishes for fire extinguishers, cabinets, and mounting brackets.

B. Product Schedule: For fire extinguishers – Coordinate final fire extinguisher schedule with fire protection cabinet schedule to ensure proper fit and function.

C. Shop Drawings: Indicate cabinet physical dimensions, rough-in measurements for recessed cabinets, wall bracket mounted measurements, and location.

D. Manufacturer's Installation Instructions: Indicate special criteria and wall opening coordination requirements.

1.04 QUALITY ASSURANCE

A. NFPA Compliance: Fabricate and label fire extinguishers to comply with NFPA 10.

B. Single Source Responsibility: Obtain extinguishers and cabinets from a single manufacturer and installer.

C. Fire Extinguishers: Listed and labeled for type, rating, and classification by UL or an Independent Testing Laboratory acceptable to the Authority Having Jurisdiction.

D. Coordination: Verify that cabinets are sized to accommodate type and capacity of extinguishers indicated.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. Conform to NFPA 10.

B. Provide extinguishers classified and labeled by Underwriters Laboratories Inc. for the purpose specified and indicated.

2.02 MANUFACTURERS

A. Fire Extinguishers:

1. Amerex Corporation.

2. Ansul Incorporated; Tyco International Ltd.

3. Badger Fire Protection; a Kidde company.

4. JL Industries, Inc.

5. Larsen's Manufacturing Co.

6. Potter-Roemer.

7. Pyro-Chem; Tyco Safety Products.

B. Fire Extinguisher Cabinets:

1. JL Industries, Inc.

2. Larsen's Manufacturing Co.

3. Potter-Roemer.

4. Safety One Industries.

2.03 EQUIPMENT

A. Fire Extinguishers:

1. Fire Extinguishers - General: Comply with product requirements of NFPA 10 and applicable codes, whichever is more stringent:

a. Provide extinguishers labeled by Underwriters Laboratories Inc. for the purpose specified and indicated.

2. FE-1 - Multi-purpose Dry Chemical Type Fire Extinguishers:

a. Nominal Size: 10 pounds.

b. UL-rated 4A:40B:C or better.

c. Finish: Red polyester powder coat.

3. FE-2 - Fire Extinguishers for Electrical Rooms: BC Dry Chemical Type Fire Extinguishers:

a. Nominal Size: 5 pounds.

b. UL-rated 10B:C or better.

c. Finish: Red polyester powder coat.

4. FE-3: BC Carbon Dioxide Type extinguisher:

a. Nominal Size: 5 pounds.

b. UL-Rated: 5B:C or better.

c. Finish: Red polyester powder coat.

2.04 MOUNTING BRACKETS

A. Mounting Brackets: Manufacturer's standard galvanized steel, designed to secure fire extinguisher to wall or structure, of sizes required for types and capacities of fire extinguishers indicated.

2.05 CABINETS

A. Fire Extinguisher Cabinets:

1. FEC 1: Outdoor Cabinet:

a. Surface-mounted type with corrosion resistant tub:

1) Basis of design: Safety One Industries: Heavy Duty Outdoor Series Fire Extinguisher Cabinet.

2. FEC-1a: Outdoor Cabinet:

a. Semi-recessed type with corrosion-resistant tub.

b. Basis of design: J.L. Industries Cosmopolitan Series, with W-style door.

c. Trim: 1-1/2-inch projection square return trim.

3. FEC-2: Cabinet Configuration: Semi-recessed type with fire-rated tub:

   a. Basis of design: J.L. Industries Cosmopolitan Series, with W-style door.

   b. Trim: 1-1/2-inch projection square return trim.

   c. Fire-rating: per contract documents.

4. FEC-3: Cabinet Configuration: Surface type with standard tub:

   a. Basis of design: J.L. Industries Cosmopolitan Series, with W-style door.

   b. Trim: 1-1/2 inch wide face.

   c. Door: 0.036 inch thick, reinforced for flatness and rigidity; latch. Hinge doors for 180 degree opening with continuous piano hinge.

   d. Lock and handle: Cylinder lock with cam and safety release to permit opening of door with sharp pull; aluminum or zinc plated handle:

      1) Basis of Design: J.L. Industries "Saf-T-Lok".

5. FEC-4: Cabinet Configuration: Recessed lockable cabinet with fire-rated tub. Cabinet to hold emergency microphone:

   a. Basis of Design: J.L. Industries Cosmopolitan Series, with L-style door.

6. Fire Extinguisher Cabinets, General:

   a. Metal: Formed stainless steel sheet; 0.036-inch-thick base metal. Finish - #4 stainless steel.

   b. Door Glazing: Glass, clear, 1/8 inch thick tempered. Set in resilient channel gasket glazing. Unless otherwise noted.

   c. Cabinet Mounting Hardware: Appropriate to cabinet. Pre-drill for anchors.

   d. Weld, fill, and grind components smooth.

   e. Finish of Cabinet Exterior Trim and Door: No. 4.

   f. Finish of Cabinet Interior: White enamel.

B. Emergency Responder Equipment Cabinets:

1. Cabinet:

   a. 18 Gauge, type 304 stainless steel construction.

   b. Dimensions: 36 inches x 24 inches x 78 inches.

   c. Lock: Coordinate with Sound Transit Operations.

2. Shelves:

   a. 18 Gauge, type 304 stainless steel.

   b. Capacity: 400 lbs. per shelf.

   c. Quantity: (4) adjustable in 2-inch increments.

C. Signage:

1. Provide manufactured code-compliant signage at each fire extinguisher or cabinet location.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine fire extinguishers for proper charging and tagging:

1. Remove and replace damaged, defective, or undercharged fire extinguishers.

B. Verify rough openings for cabinets are correctly sized and located.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

A. Install fire extinguishers and mounting brackets in locations indicated and in compliance with requirements of the Authority Having Jurisdiction:

1. Mounting Brackets: Install cabinets plumb and level in wall openings, at height above finished floor to top of fire extinguisher indicated in the drawings.

B. Mounting Brackets: Fasten mounting brackets to surfaces, square and plumb, at locations indicated.

END OF SECTION

SECTION 10 81 13

BIRD CONTROL DEVICES

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for the following:

a. Bird deterrent systems to deter birds from landing and nesting where shown and detailed on the drawings, and in locations as follows:

1) Roof and canopy edges, structural surfaces, ledges, light fixtures, signage and openings to cavities and unoccupied spaces susceptible to birds landing and nesting.

2) Elevated guideway surfaces at the column head / girder connections, joints with elastomeric bearings, and drain holes or other openings into the guideway.

2. System types:

a. BCD-1: Post and Wire.

b. BCD-2: Bird Spikes.

c. BCD-3: Bird Spiders.

d. BCD-4: Bird Netting.

e. BCD-5: Bird Wedges.

f. BCD-6: Bird Coil.

3. Audible bird deterrent system for use during construction.

B. Related content:

1. Sheet metal flashing caps as detailed in Issued for Construction Drawings and specified in Section 07 62 00 - Sheet Metal Flashing and Trim.

1.02 SUBMITTALS

A. Submit:

1. Manufacturer's descriptive product data.

2. Shop Drawings:

a. Provide shop drawings for each bird deterrent system. Indicate typical layout in plan and elevation including dimensions and anchoring provisions, type, design and spacing for each substrate and condition. For BCD-4 Bird Netting, indicate access locations to routinely serviced items behind the bird net.

b. Submit detail drawings of special accessory components not included in manufacturer’s product data.

c. Provide drawings showing temporary location and orientation of all audible bird deterrent components.

d. Wiring diagrams and temporary power requirements.

3. Verification Samples:

a. BCD-1: Post and Wire:

1) Wire support posts for approval.

2) Control wire, 6 inches long each.

b. BCD-2: Bird Spikes:

1) 6-inch-long spike strip for approvals.

c. BCD-3: Bird Spiders:

1) Full assembled product for approval.

2) Attachments.

d. BCD-4: Bird Netting:

1) 12-inch square section of netting.

2) Typical cable and connector.

e. BCD-5: Bird Wedges:

1) Assembled wedge including:

a) 4-foot section indicating profile and finish for approval.

b) Slope extender: 4-foot section.

c) End caps, 2 each type.

d) Mounting Clips.

f. BCD-6: Bird Coil:

1) Strip of coil with minimum 3 loops indicating gauge, diameter and finish.

2) Attachment clips.

4. Manufacturer's Installation Instructions: Indicate preparation and installation instructions.

B. Transmit:

1. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

2. Qualification Statements:

a. Manufacturer.

b. Installer.

1.03 QUALITY ASSURANCE

A. Manufacturer qualifications: Company specializing in manufacturing the products specified in this Section with minimum 3 years documented experience.

B. Installer Qualifications: Company completely familiar with installation of products similar to those required for this Contract.

C. Mock-Up:

1. Install one pin-and-wire assembly representative of each design required on Contract.

2. Where one design may be used for different penetrating items or in different wall constructions, install one assembly for each different combination.

3. If accepted, mock-up may remain as part of the Work. Remove and replace mock-ups that are not accepted.

1.04 DELIVERY, STORAGE AND HANDLING

A. Store and handle materials to avoid damage to products and injury to Installers.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. BCD-1: Post and Wire:

1. Basis of Design: Bird B Gone Inc.; Product: “Bird Wire Post and Wire Bird Deterrent”.

2. Nixalite Inc.; Product: “FliteLine Post and Wire Bird Deterrent”.

3. Bird Busters Co.; Product: “Post and Wire Bird Deterrent”.

B. BCD-2: Bird Spikes:

1. Acceptable manufacturers and products:

a. Bird-B-Gone Stainless Steel Bird spikes.

b. Nixalite Inc.; Product: Premium Bird Barrier Spikes.

c. Bird Busters Co.; Product: Stainless Steel Spikes.

B. BCD-3: Bird Spiders:

1. Basis of Design Manufacturer: Bird B Gone Inc; Product: Bird Spider 360.

C. BCD-4: Bird Netting:

1. Bird Barrier America, Inc.: Stealth Net.

2. Bird-B-Gone: Bird Net 2000.

D. BCD-5: Bird Wedges:

1. Basis of Design: Bird B Gone, Inc:; Product: “Bird Slope”.

E. BCD-6: Bird Coil:

1. Basis of Design: Bird Barrier, “Bird-Coil”

F. Construction Period Audible System Manufacturers:

1. Bird-X, Sonic Bird Control, “BirdXPeller PRO”.

2. Bird-B-Gone, “Bird Chase Super Sonic”.

2.02 MANUFACTURED PRODUCTS

A. BCD-1: Post and Wire:

1. Stainless steel posts with flat base minimum 4 inches by 4 inches for adhesive attachment of system to roof membrane substrate.

2. Nylon-coated stainless-steel wire.

3. Stainless steel tension springs.

4. Finish: Natural stainless-steel finish.

B. BCD-2: Bird Spikes:

1. Materials:

a. Spikes: stainless steel.

b. Width of coverage: As required.

c. Number of spikes: Minimum 40 spikes per linear foot.

d. Height of spikes: 4-3/4-inches.

e. Base Strip: Flexible. Base can bend up to 360 degrees.

f. Length: 2 ft. sections.

2. Finish: Natural stainless-steel finish.

C. BCD-3: Bird Spiders:

1. Two-foot diameter with stainless steel arms attached to UV protected polycarbonate base.

2. Material: 316 stainless-steel.

D. BCD-4: Bird Netting:

1. Materials:

a. UV stabilized knotted polyethylene net.

1) Color: black.

b. Flame resistant: 270-degree Fahrenheit melting point.

c. Size: 3/4-inch, heavy duty.

d. Stainless-steel cable framework to support bird netting.

e. Hardware: All metal hardware to be stainless steel.

f. Access zippers for serviced items behind the net.

E. BCD-5: Bird Wedges:

1. Material:

a. Prefabricated sloped U.V. protected outdoor grade PVC plastic.

b. Provide Coordinating slope extenders, end caps.

2. Mounting as determined by manufacturer based on project conditions.

F. BCD-6: Bird Coil:

a. Material: Stainless Steel wire, 4-inch or 5-inch coil diameter.

b. Start and end posts with clips at 1 foot intervals.

G. Construction Period Audible System Manufacturers and Components:

1. Bird-X, Sonic Bird Control, “BirdXPeller PRO”.

2. Bird-B-Gone, “Bird Chase Super Sonic”.

3. Sound unit and speaker(s) for one acre coverage.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Verify that installation surfaces are ready to receive architectural bird control. Do not proceed until unsatisfactory conditions have been corrected.

3.02 INSTALLATION

A. Thoroughly clean the surfaces to receive bird deterrent to be free of bird droppings, nesting materials, rust, peeling paint or other debris.

B. Install architectural bird control in accordance with manufacturer's printed instructions.

C. BCD-1: Post and Wire:

1. Attach bird wire posts to metal roof surfaces or to roof membrane with adhesive product approved by roofing manufacturer.

2. Install bird wire posts at spacing specified in manufacturer's installation instructions, for uniform appearance and without end-to-end gaps.

3. Install wire and tension springs as specified in manufacturer’s installation instructions.

D. BCD-2: Bird Spikes and BCD-3: Bird Spiders:

1. Attach base with spikes to surfaces with adhesive product approved by roofing manufacturer.

2. Follow the contours and angles closely; cut or break away to fit properly.

3. Space materials in accordance with manufacturer's recommendations.

E. BCD-4: Bird Netting:

1. Install bird netting per manufacturer's recommendations.

2. Install perimeter cable system to structure with attachments provided for substrate material.

3. Attach netting to cable system tightly with provided rings.

4. Bird netting shall precisely match the area to be protected, ensuring that birds cannot access the protected zone while seamlessly integrating with the architectural design.

5. The maximum distance between attachments shall be per manufacturer's recommendation; maximum of 24-inches.

6. Locate access zippers for serviced items behind the net.

F. BCD-5: Bird Wedges:

1. Install wedge as recommended by the manufacturer, covering the entire depth of the surface.

2. Follow the contours and angles closely.

3. Use End Caps to close off where open.

G. BCD-6: Bird Coil:

1. Install wedge as recommended by the manufacturer.

H. Audible System during construction:

1. Program recorded bird sounds used in audible control devices to control birds typically found in the Puget Sound Region.

3.03 REMOVAL

A. Remove and decommission temporary audible bird deterrent equipment at Final Acceptance.

3.04 FIELD QUALITY CONTROL

A. Inspect finished installations and make adjustments as necessary.

END OF SECTION

SECTION 11 08 00

COMMISSIONING OF EQUIPMENT

NOTE TO DESIGNER:

SECTIONS WITH BRACKETS. E.G., [TEXT] ARE TO BE MODIFIED OR DELETED IF NOT APPLICABLE. ITALICIZED TEXT PROVIDES INSTRUCTION TO THE DESIGNER TO INCLUDE LANGUAGE ON SPECIFIC TOPICS WHEN APPLICABLE. THE INSTRUCTIONS ARE TO BE DELETED WHEN THE SPECIFICATION IS FINALIZED. LANGUAGE NOT IN BRACKETS IS TO BE USED 'AS IS' WITHOUT MODIFICATION OR WITH AN APPROVED SPECIFICATION MODIFICATION REQUEST.

DESIGNER TO DELETE TEXT ABOVE FOR FINAL SECTION

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes: Commissioning process requirements for Equipment. *[Designer: For most facilities this is focused on fall-arrest. For Maintenance facilities Industrial Equipment is to be identified and included in this specification.]*

1. Level 1 commissioning activities for Equipment.

2. [Support for Level 2 commissioning activities for Equipment.]

a. [Designer: Adjust Level 2 scope to reflect addition of Industrial or Special equipment associated with a maintenance facility. Level 2 would include validation of functionality between equipment and interfacing or interlocking functions of other equipment and systems]

3. Support for Level 3 commissioning activities related to Equipment.

4. Support for Level 4 commissioning activities related to Equipment.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. ASTM International (ASTM):

a. ASTM E165/E165M Standard Practice for Liquid Penetrant Examination for General Industry.

b. ASTM E709 Standard Guide for Magnetic Particle Testing.

2. American Welding Society (AWS):

a. AWS B1.10M/B1.10 Guide for the Nondestructive Examination of Welds.

B. Definitions

1. See general commissioning requirements as stated in the Contract Documents for commissioning definitions.

2. Systems, Equipment, and Components: Where these terms are used together or separately, they shall mean "as-built" systems, equipment, and components.

1.03 COORDINATION

A. See general commissioning requirements as stated in the Contract Documents for general coordination requirements related to commissioning.

B. Coordinate completion of Install Verification forms, by the Quality Control Inspector, as identified in the Contractors Quality Control Inspection and Test Plan

1.04 COMMISSIONING ACTIVITIES

A. Furnish labor and material to accomplish building commissioning as specified as part of general commissioning requirements as stated in the Contract Documents, and in this specification, including:

1. Provide to the Testing and Commissioning Manager preliminary O&M information for use in developing commissioning test procedures.

2. Assist the Testing and Commissioning Manager in developing commissioning activity procedures and data forms submittals for work specified in this Section.

3. Provide information to the Testing and Commissioning Manager needed for control interface wiring diagrams submittals for the work of this Section.

4. Perform Level 1 commissioning activities specified in this Section, including installation verification, static tests, start-up, component tests, equipment tests, systems tests.

5. Operate equipment and systems during commissioning activities as required by the Testing and Commissioning Manager.

6. Perform and document commissioning tests to verify readiness for commissioning test demonstration. Commissioning tests are specified in this specification.

7. Correct issues and repeat commissioning tests when results do not meet acceptance criteria.

8. Commissioning Test Demonstrations: General requirements for commissioning test demonstrations are specified as part of general commissioning requirements as stated in the Contract Documents:

   a. Repeat commissioning tests on a sample basis to demonstrate acceptable performance: Level 1 Component, Equipment, and System Commissioning Tests, and for Level 2 Intra-station system interface tests.

   b. Record and submit commissioning test demonstration data and issues.

   c. Correct issues and repeat commissioning test demonstration when results do not meet Acceptance Criteria.

9. Attend commissioning meetings as requested by the Testing and Commissioning Manager.

10. Report any inconsistencies or issues in system operations or performance.

11. Provide personnel to support commissioning test demonstration specified in this specification as requested by the Testing and Commissioning Manager.

12. In the event that a commissioning test demonstration fails, assist in determining the cause of failure. Make corrections as necessary.

B. Cooperate with Testing and Commissioning Manager to accomplish commissioning work on schedule and in coordination with other trades.

PART 2 - PRODUCTS

2.01 TEST EQUIPMENT

A. Provide test equipment and instrumentation, including consumable supplies, required to execute commissioning activities. Unless noted otherwise, test equipment and instrumentation remain the property of the Contractor.

B. Test weight for fall arrest equipment – 50 percent of maximum design load / anchor rated capacity.

C. Provide proprietary test instruments or tools required by the equipment manufacturer. Provide and operate the proprietary test instruments or tools as required for commissioning work.

PART 3 - EXECUTION

3.01 LEVEL 1 COMMISSIONING ACTIVITIES REQUIREMENTS

A. Level 1 commissioning activities scope: Technical requirements for commissioning of Equipment are specified in this specification.

B. Provide technicians, instrumentation, and tools to perform commissioning activities in accordance with accepted commissioning activity procedures at the direction of the Testing and Commissioning Manager.

C. Scope of Equipment commissioning activities applies to all portions of the Equipment installation described in the test. Where sampling is specified, it applies only to the commissioning test demonstration.

D. Upon approval of product submittals associated with Technical requirements and the scope of Commissioning develop and submit for approval Install Verification Checklist forms for the quality criteria of the Work specified in this specification.

E. Preparation:

1. Certify that Equipment, subsystems, and equipment have been completed, calibrated, and started; and are operating in accordance with Contract Documents.

2. Testing Instrumentation: Install measuring instruments and logging devices to record test data in accordance with accepted commissioning test procedures as directed by the Testing and Commissioning Manager and acceptable to Commissioning Authority.

3. Certify that Equipment instrumentation and control systems have been completed and calibrated; are operating according to the Contract Documents; and that pretest set points have been recorded.

4. Set systems, subsystems, and equipment into operating mode to be tested (e.g., normal shut down, normal auto position, normal manual position, unoccupied cycle, emergency power, and alarm conditions) in accordance with accepted

commissioning test procedures as directed by the Testing and Commissioning Manager.

F. Test all operating modes, interlocks, control responses, and responses to abnormal or emergency conditions, and verify proper response of building automation system controllers and sensors.

G. Perform tests using design conditions whenever possible. If tests cannot be completed because of a deficiency outside the scope of the Equipment system, document the deficiency and report it to Sound Transit. After deficiencies are resolved, reschedule tests.

H. Simulated conditions may need to be imposed using an artificial load when it is not practical to test under design conditions. Provide equipment to simulate loads. Set simulated conditions in accordance with accepted commissioning test procedures as directed by the Testing and Commissioning Manager. Document simulated conditions and methods of simulation. After tests, return settings to normal operating conditions.

I. Request approval to alter set points when simulating conditions is not practical. Request approval to alter sensor values with a signal generator when design or simulating conditions and altering set points are not practical.

J. If tests cannot be completed because of a deficiency outside the scope of the Equipment system, document the deficiency and report it to Sound Transit. After deficiencies are resolved, reschedule tests.

K. Where seasonal testing is specified, complete appropriate initial commissioning tests and documentation within the Construction Period. Schedule and execute seasonal tests when specified conditions are expected.

3.02 LEVEL 1 COMMISSIONING ACTIVITY PROCEDURES

A. Submit level 1 commissioning activity test procedures and data forms for the following types of commissioning activities, requirements for which are specified in this specification:

1. Level 1 commissioning activities:

a. Installation verification.

b. Start-up procedures.

c. Equipment tests.

d. System tests.

2. Example checklists/test forms can be provided upon request.

3.03 LEVEL 1 INSTALLATION VERIFICATION CHECKLIST REQUIREMENTS

A. Scope: Installation verification requirements apply to the following:

1. Roof safety anchors.

2. Fall-arresting systems.

3. [Designer: Review identified systems and add to list or modify as necessary based on location design for fall-arrest systems. Coordinate with Section 11 24 29 – Facility Fall Protection.].

4. [Designer: Review industrial equipment for maintenance facilities and include appropriate list of items].

B. Installation verification checklist forms shall include the following:

1. Organized to prompt the installer to check off quality criteria for each discrete portion of the Work.

2. Identify the system or features to which the installation verification checklist applies at the top of the form.

3. Section for verification of delivery of accepted materials.

4. Section for condition of materials at delivery.

5. Section for verification that installation meets contract documentation and any special installation instructions by respective manufacturer.

6. Space at the end of the form for the Quality Control inspector designated for the scope to review and accept installation verification. QC Inspector must perform Install Verification and verify each element identified in form has been reviewed for conformance with contract documents and in accordance with the Contractors Quality Control Inspection and Test Plan as part of Section 01 45 00 - Quality Assurance/Quality Control.

7. Space at the end of the form for the installer to print their name and company name, fill in the date, and sign or initial.

8. Space to identify the area of work for which the installer is executing the Installation Verification Checklist.

9. Description of the quality criteria as it pertains to the specific work. Include a check-box for each criterion.

10. Example checklists/test forms can be provided upon request.

C. Quality Criteria: Installation verification checklists shall address the following quality criteria:

1. Material, make and model match accepted submittals.

2. Equipment is installed without visible damage.

3. Location is as indicated on drawings.

4. Equipment is accessible for maintenance using safe work practices.

5. There is sufficient space to remove and replace components intact without demolishing other work.

6. Equipment surfaces are clean and free of dust, dirt, oil and other contaminants.

7. Roof safety anchors: Including visual inspections by the contractor in accordance with roof safety anchors field quality control requirements as stated in the Contract Documents.

8. Fall-arresting system: Including comparison with accepted mockups.

D. Fill out and sign installation verification checklists for Equipment while the Work is being installed. The intent is to fill out and sign the installation verification checklist as work proceeds to improve the quality of the installation. Retain completed installation verification checklists on site for review.

E. Before performing a commissioning test, installation verification checklists must be performed and completed by QC inspector designated for the appropriate area specified here in and within the Contractors Quality Control Inspection and Test Plan as part of Section 01 45 00 - Quality Assurance/Quality Control. Submit completed installation verification checklists for work included in the commissioning test.

3.04 LEVEL 1 INSTALLATION VERIFICATION

A. Installation verification checklists are required for the following, minimum:

1. 1108-IV-01 Roof Safety Anchors.

2. 1108-IV-02 Fall-Arresting Systems.

3. [*Designer: Review identified IV's, E and S tests and add or modify as necessary based on location design for fall-arrest systems. Coordinate with Section 11 24 29 - Facility Fall Protection].*

4. [Designer: Review industrial equipment for maintenance facilities and include appropriate list of items].

3.05 LEVEL 1 EQUIPMENT TESTS

A. 1108-E-01: Roof Safety Anchors:

1. System/Equipment to be Tested:

a. Roof safety anchors, including attachment to structure.

2. Functions to be Tested: [Perform the following inspections and tests in accordance with roof safety anchors field quality control requirements as stated in the Contract Documents.

a. Nondestructive Testing.

b. Magnetic Particle Inspection.

c. Liquid Penetrant Inspection.

3. Conditions of the Test:

a. Nondestructive Testing: AWS B1.10M/B1.10.

b. Magnetic Particle Inspection: ASTM E709.

c. Liquid Penetrant Inspection: ASTM E165/E165M.]

[*Designer: Coordinate testing requirements with anchor attachment basis of design and adjust testing references and requirements appropriately]*

4. Acceptable Results:

a. As specified by the listed standards.

3.06 LEVEL 1 SYSTEM TEST (NOT USED)

A. 1108-S-01: Fall-arresting Systems:

1. System/Equipment to be Tested:

a. Fall-arresting systems, including attachment to structure.

2. Functions to be Tested: Perform the following inspections and tests in accordance with fall-arresting systems testing requirements as stated in the Contract Documents:

   a. Load performance.

3. Conditions of the Test:

   a. Load cell tests in accordance with manufacturer's recommendations. Submitted procedure shall identify recommended steps or attach manufacturer’s procedures.

4. Acceptable Results:

   a. As specified in accordance with manufacturer’s recommendations. Submitted procedure shall identify recommended pass/fail criteria.

3.07 LEVEL 1 TEST REQUIREMENTS MATRIX

	1108-IV-0X	1108-E-0X	1108-S-01
Roof Safety Anchors	X	X	
Fall-Arresting Systems	X		X

[DESIGNER: ADD OR MODIFY MATRIX AS NECESSARY BASED ON TESTS ADDED OR MODIFIED ABOVE DEPENDING UPON THE LOCATION DESIGN FOR FALL-ARREST SYSTEMS. COORDINATE WITH SECTION 11 24 29]

[DESIGNER: ADD OR MODIFY MATRIX AS NECESSARY BASED ON TESTS ADDED OR MODIFIED ABOVE DEPENDING UPON THE LOCATION DESIGN FOR INDUSTRIAL EQUIPMENT ASSOCIATED WITH A MAINTENANCE FACILITY]

SECTION 11 24 29

FACILITY FALL PROTECTION

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements and specifications for design and installation of the following fall protection systems:

a. Horizontal lifeline fall-arresting cable systems (HLL), including the designing, furnishing, and installing of complete systems, as defined by WAC 296-880, for safe maintenance and access.

a. Horizontal fall protection rail systems, including attachment carriage, attachment plates, joints, corners, system stops, rail, carriage stops and specialty components for exposed and concealed conditions.

b. Wall mounted anchors.

c. Removable concrete detent anchors.

b. Ladder tie off systems.

c. Roof mounted anchor posts.

d. Delegated design and engineering for complete facility fall protection system.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. Code of Federal Regulations:

a. 29 CFR 1910 - Occupational Safety and Health Standards.

b. 29 CFR 1910.23 – Ladders.

c. 29 CFR 1910.27 - Scaffolds ad Rope Descent Systems.

d. 29 CFR 1910.28 - Duty to have Fall Protection and Falling Object Protection.

e. 29 CFR 1910.29 - Fall Protection Systems and Falling Object Protection - Criteria and Practices.

f. 29 CFR 1910.140 - Personal fall protection systems.

g. 29 CFR 1910.66 - Powered Platforms for Building Maintenance.

h. 29 CFR 1926 - Safety and Health Regulations for Construction.

i. 29 CFR 1926.502 - Fall Protection Systems Criteria and Practices.

j. 29 CFR 1926.1053 – Ladders.

2. American Institute of Steel Construction (AISC):

   a. AISC S342L, with Supplement No.1 "Load and Resistance Factor Design Specification for Structural Steel Buildings".

3. American Welding Society (AWS):

   a. AWS D1.1 Structural Welding Code – Steel.

   b. AWS D1.2 Structural Welding Code – Aluminum.

   c. AWS D1.6/D1.6M - Structural Welding Code - Stainless Steel.

   d. AWS A2.4 Standard Symbols for Welding, Brazing, Nondestructive Examination.

   e. AWS B1.10M/ B1.10 - Guide for the Non-Destructive Examination of Welds.

4. American National Standards Institute (ANSI):

   a. ANSI/IWCA I-14 Window Cleaning Safety Standard (International Window Cleaning Association).

   b. ANSI/ASSP Z359.1 – The Fall Protection Code.

   c. ANSI/ASSP Z359.6 - Specifications and Design Requirements for Active Fall Protection Systems.

   d. ANSI/ASSP Z359.7 - Qualification and Verification Testing of Fall Protection Products.

   e. ANSI/ASSP Z359.11 - Safety Requirements for Full Body Harnesses.

   f. ANSI/ASSP Z359.12 - Connecting Components for Personal Fall Arrest Systems.

   g. ANSI/ASSP Z359.15 - Safety Requirements for Single Anchor Lifelines and Fall Arresters for Personal Fall Arrest Systems.

   h. ANSI/ASSP Z359.16 - Safety Requirements for Climbing Ladder Fall Arrest System.

   i. ANSI/ASSP Z359.18 - Safety Requirements for Anchorage Connectors for Active Fall Protection Systems.

5. American Society for Testing and Materials International (ASTM):

   a. ASTM A666 - Standard Specification for Annealed or Cold-Worked Austenitic Stainless-Steel Sheet, Strip, Plate, and Flat Bar.

   b. ASTM D1056 - Standard Specification for Flexible Cellular Materials - Sponge or Expanded Rubber.

   c. ASTM D2000 - Standard Classification System for Rubber Products in Automotive Applications.

   d. ASTM F594 - Standard Specification for Stainless Steel Nuts.

6. Occupational Safety and Health Administration (OSHA):

   a. OSHA 1926.502 - Fall Prevention Systems and Criteria and Practices.

7. Washington Administrative Code (WAC):

   a. WAC 296-876-50010 – Design and Construction – Fixed ladders installed on or after December 1, 2006 (ANSI A14.3).

   b. WAC 296-880 - Unified Safety Standards for Fall Protection.

   c. WAC 296-878 - Safety Standards for Window Cleaning.

B. Definitions:

1. Anchorage: A secure connecting point or a terminating component of a fall protection system or rescue system capable of safely supporting the impact forces applied by a fall protection system or anchorage subsystem.

2. Anchorage Connector: A component or subsystem that functions as an interface between the anchorage and a fall protection, work positioning, rope access, or rescue system for the purpose of coupling the system to the anchorage.

3. Fall Arrest System: A system designed to stop you in the process of a fall, typically including an anchor point or series of anchor points, a safety lanyard or self-retracting lifeline, and a harness.

4. Fall Restraint System: A system designed to keep you from getting close enough to the fall hazard to fall, typically including an anchor point or series of anchor points, a safety lanyard or self-retracting lifeline, and a harness.

5. Fall Protection System: System can be either a fall arrest or a fall restraint system.

6. Lifeline: A component of a fall protection system consisting of a flexible line designed to hang vertically, a vertical lifeline, or connecting to anchorages or anchorage connectors at both ends to span horizontally, a horizontal lifeline.

1.03 SUBMITTALS

A. Submit: Detailed shop drawings showing design and fabrication for complete fall protection systems, signed and sealed by the qualified professional engineer responsible for their preparation licensed to practice in the state of Washington:

1. Include dimensioned layout drawings of a fully designed and fully complete layout of each system and anchor in relation to the supporting structure indicating the locations of all components in the system properly labeled for identification. Show adjacent conditions and illustrate access to architectural, structural, mechanical, electrical, fire, and plumbing elements.

2. Include detailed structural drawings of all anchor connections.

3. Indicate the intended access points for the various fall protection systems.

4. Installation and rigging instructions and all necessary Restrictive and Non-Restrictive Working Usage Notes and General Safety Notes, such as fall arrest of restraint, the number of permitted users.

5. Indicate welds, both shop and field, using standard welding symbols of AWS A2.4. Show the size, length, and type of each weld on drawings. Indicate all mechanical

connections with type and material of fasteners and type of galvanic separation. Include all ICC-ES reports for all fasteners.

B. Submit: Analysis data and calculations signed and sealed by the qualified professional engineer responsible for their preparation licensed to practice in the State of Washington for review by structural engineer, for loads imposed and attachment to structure.

C. Submit: Certified test reports indicating load capacity (static and dynamic) of roof anchors and suspension assemblies.

D. Submit: In addition to the requirements stated elsewhere in the Contract Documents, the Operation and Maintenance Manual shall include the following:

1. Maintenance Procedures: Including maintenance requirements for all equipment. Language requiring periodic inspection, testing or certification by a specific entity is not acceptable.

2. Operations Procedures: Indicating proper use of equipment for safe operation of the system.

3. Parts List: Include all components, listed by system. Include respective serial numbers for each component. If systems are provided at multiple locations or facilities, identify the location where individual components are located.

4. Test Certificate: Indicating completion of proof load testing on installed systems. Include copies of approved system calculations.

5. Product certificate: containing the manufacturer's serial number, name and part number of each individual component used in the system; manufacturer's catalog data indicating the sizes, descriptions, capacities, test certifications for qualifications and verifications testing, and other descriptive data showing sufficient detail that the product complies with the contract requirements.

6. Inspection Log Book: Include blank inspection sign-off forms in the Operation and Maintenance Manual. In addition, submit one copy of a complete Inspection Log Book with the "Initial Inspection - Certification for Use" and "Inspection Sign-Off" forms completed.

2. As-Built Drawings and calculations: A copy of as-built drawings, shop drawings, and calculations shall be included in the Operation and Maintenance Manual. As-built drawings shall include layout drawings of each system and anchor in relation to the supporting structure indicating the locations of all components in the system properly labeled for identification. Include structural detail drawings showing all anchor connections. Indicate individual welders' identification on Contract record drawing.

7. Calculations and analysis of anchor strengths, system loads, and maximum fall distance/clearance requirements for future certification reference.

8. Product Data: Material, equipment, and fixture lists. Manufacturer's catalog data indicating the sizes, descriptions, capacities, test certifications, and other descriptive data showing in sufficient detail that the product complies with the contract requirements. Equipment and performance data including but not limited to lifeline anchors, safety tieback anchors, energy-absorbing devices, body harnesses, lifeline cable.

9. Posted Drawings:, Mount a plastic laminated copy of the as-built shop drawing showing equipment locations and details, and manufacturer's directions for use, near each exit onto the roof.

E. Transmit: Manufacturer's Instructions: Manufacturer's instructions indicating the manufacturer's recommended method and sequence of installation for the following: lifeline anchors, safety tieback anchors, energy-absorbing devices, body harnesses, and lifeline cable.

F. Transmit: Evidence of Liability Insurance: Provide written documentation in evidence and demonstration of fulfillment of requirements of Article 1.04 C, herein below.

1.04 QUALITY ASSURANCE

A. Manufacturer: specializing in the design, fabrication and installation of fall-arresting lifeline and safety tieback anchor systems having a minimum of 5 years documented experience.

B. Loading and safety assurance: meet the requirements of governing codes and jurisdiction and comply with properly engineered loading and safety criteria for the intended use.

C. Insurance: Manufacturer shall carry specific liability insurance (products and completed operations) in the amount of $2,000,000.00 to protect against product/system failure.

D. Welding: executed by certified welders in accordance with AWS requirements.

E. Engineering Responsibility: Preparation of Shop Drawings, design calculations, and other structural data by a professional engineer registered to practice in the State of Washington with at least ten (10) years of structural design experience who is Qualified under WAC and ANSI Z359 requirements to design fall protection systems:

1. Fall-Arresting System Pre-Approval: Obtain approval of Authority Having Jurisdiction before proceeding.

2. Mock-Up Requirement:

a. Provide mock-up of each type of anchor, tie-back, safety anchor or suspension system to the Resident Engineer for approval.

b. If accepted, mock-up shall represent minimum standard for the Work of this Section.

c. If accepted, mock-up may remain as part of the Work. Remove and replace mock-ups that are not accepted.

1.05 REGULATORY REQUIREMENTS

A. Comply with the following WAC, OSHA and ANSI regulations:

1. WAC 296-880.

2. WAC 296-878.

3. ANSI Z359.1.

4. 29 CFR 1910, Subpart D (Walking and Working Surfaces).

5. Appendix C to 29 CFR 1910 Subpart F (Personal Fall Arrest Systems).

6. "OSHA Ruling on Window Cleaning by Bosun's Chair" Memorandum to Regional Administrators from P. K. Clark, Director, Directorate of Compliance Programs.

7. OSHA 1926.502 Fall Prevention Systems and Criteria and Practices.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Deliver materials in manufacturer's original unopened packaging. Store materials in original protective packaging inside a well-ventilated area protected from weather, moisture, soiling, abrasion, extreme temperatures, and humidity.

1.07 PROJECT CONDITIONS

A. Field Measurements: Verify actual locations of structural framing and other construction contiguous with lifeline and safety tieback anchor system and window-washing suspension anchor system equipment by field measurements before fabrication and indicate measurements on Shop Drawings.

1.08 WARRANTY

A. Extended Correction Period: Correct defective work within a 2-year period commencing on the Date of Substantial Completion.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. Design fall-arresting lifeline and safety tieback anchor system that will allow the user to walk uninterrupted the entire length of the system and provide secure anchorage to arrest a fall by the users in accordance with standards and regulations/codes. Design system to fully protect the user at all times while in the area of potential fall hazard. Design lifeline system for two simultaneous users. Use safety tieback and suspension anchors that are rated for attachment of a single user. Include all components required to provide a complete and fully operational system.

B. Structural Performance: Provide fall-arresting lifeline and safety tieback anchor system capable of withstanding design loads as required by governing regulations and codes. Where component design loads are specified herein, they represent design minimum requirements. Design the fall arresting lifeline and safety tieback anchor system and window-washing suspension anchor system as specified herein, and all associated connections to conform to the conditions shown on the Issued for Construction Drawings. Ensure that all anchor components conform to proper engineering principles and have been designed by a professional engineer who is legally qualified and registered to practice in the State of Washington where Contract is located and who is experienced in the design of fall arresting and anchoring systems, its application and safety requirements. Sound Transit takes no responsibility for product design, manufacture, delivery and handling, or connection to basic structure. Furnish and install all necessary bracing, ties, anchorage, distribution members, and similar elements in conformance with submitted drawings and calculations.

C. The Engineer retained by the Contractor shall be responsible for verifying that system components are attached in such a manner that their forces cause no distress to the basic structure. The engineer must verify the structural adequacy of the existing structural system under the additional load from the fall protection in accordance with applicable codes. Where necessary, provide additional structural elements to safely distribute forces.

1. Provide submittal to Structural Engineer of record retained by the Contractor for review during submittal process and prior to installation.

2. The installation must not be performed until the submittal is approved by the Resident Engineer.

D. Locate anchorages to suit suspension equipment used on the building with respect to items such as reach, rigging, spacing, roof edge condition, and similar items, including full access to roof mounted equipment.

E. Design all anchor components to provide adequate attachment to the building and suited to current suspended maintenance practices. Ensure compatibility with industry standard equipment. Attachment of anchor post to be mechanically fastened and not welded to building structure.

F. Design system fall-arresting lifeline and safety tieback anchor system and window-washing suspension anchor system to comply with the following structural requirements without damage to underlying structure, detachment, or fracture of anchor assembly:

1. Safety Tieback Anchors: designed to allow the user to connect personal fall arrest equipment and designed with a minimum 2:1 factor of safety and withstand a force of 5000 lbs.

2. Horizontal fall protection rail system designed to allow the user to connect personal fall arrest equipment and designed with a minimum 2:1 factor of safety and to withstand a force of 5000 lbs.

G. Coordinate ladder tie-off and anchor locations such that the worker can connect to the initial anchor or lifeline from the ladder.

H. Other than during suspended work, the worker must be able to navigate the entire fall protection system without switching from one lanyard type to another and without completely disconnecting from protection.

2.02 MANUFACTURERS

A. Accepted Fall-Arresting System Suppliers:

1. Spider Staging Co.

2. Flexible Lifeline Systfems Co.

3. Gravitec Systems, Inc.

4. DBI-SALA.

5. Rooftop Anchor, Inc.

6. UniRail by Uline.

2.03 HORIZONTAL LIFE-LINE FALL RESTRAINT SYSTEM (HLL)

A. Intermediate cable attachment bracket.

B. Marine grade, 8mm stainless steel cable.

C. Lifeline systems connectors, cables and bolts: manufactured from stainless steel: ASTM A666, Type 316. Connectors: OSHA regulation 1926.502.

D. Components:

1. Tension Indicators and Turn-Buckles:

a. Include pretension indicator to verify and adjust correct tension of the lifeline cable.

b. Calculate cable tensions with minimum breaking strength exceeding 8,000 pounds and in conformance to manufacturer's instructions.

2. D-Rings:

a. Exceed minimum breaking strength of 10,000 pounds.

b. Fasten to supporting structure in accordance with the drawing requirements.

c. Include a lock washer under turned elements.

3. In-Line Shock Absorbers:

a. Utilize to dissipate energy generated in a fall and to reduce the end anchorage forces.

b. Exceed minimum breaking strength of 8,000 pounds.

c. Exceed 180-pound allowable normal preset tension.

d. Do not exceed activation threshold of 440 pounds.

e. Shock absorbers shall visually display deployment in the event a load such as a fall has occurred on the system.

4. Cable:

a. 7 X 7 wire rope construction.

b. 5/16-inch (8mm) diameter.

c. Minimum breaking strength of 8,000 lbs.

d. Do not exceed weight of 0.18 pounds/foot.

e. Terminate cable ends with swaged fittings.

5. Intermediate Supports: Design to ensure passage of the pass-through trolley over intermediate anchorage points/posts without being released from the system lifeline.

6. D-ring Storage Cabinet:

a. Wall hanging stainless steel box painted:

1) Exterior of cabinet door: provide signage identifying contents.

2) Interior face of cabinet door: attach instruction for the use of D-rings.

b. Capacity: Provide for each removable D-ring anchor and each removable lifting ring at each location:

1) Include removable flush plug device for each removable anchor, plus 10 percent spares.

c. Finish: As selected by Resident Engineer.

d. Location: As noted on Drawings.

7. Attachment Transfastener/Trolley: Manufacturer’s standard stainless steel attachment trolley. Trolley shall allow for easy pass-through of support points without disconnecting from the system:

   a. Minimum tensile strength 3600 lbs.

   b. Provide 4 carriages per system type at each facility.

2.04 HORIZONTAL FALL PROTECTION RAIL SYSTEMS

A. Basis of design: 3M Fall Protection; DBI-SALA® Roofsafe™ Rail System.

B. Components:

   1. Rail: Low profile 1-1/4 -inches by 1-1/4-inches aluminum extrusions.

   2. Rail Joint: Low profile, aluminum extrusion to connect to rail sections.

   3. Corners: Additional bends and forms available to a radius of 7-7/8- inches.

   4. System Stops: Manufacturer’s standard stops which prevent rails from coming out of end anchorage bracket.

   5. Molded Ends: Manufacturer’s standard molded ends which protect exposed edge of end rails.

   6. Tamper-Proof Carriage Stops: Manufacturer’s standard tamper-proof, carriage stops which prevent carriages from coming off the end of the system.

   7. Removable Carriage Stops: Manufacturer’s standard tamper-proof, carriage stops which prevent carriages from coming off the end of the system but can be removed to allow the carriages to be taken off.

   8. Attachment Carriages: Manufacturer’s standard aluminum attachment carriage with aluminum, nylon coated wheels. A stainless-steel shackle with carabiner hook which pivots for any angle connection:

      a. Minimum tensile strength 3370 lbs.

      b. Provide 4 carriages per rail length.

2.05 WALL-MOUNTED ANCHORS

A. Manufacturers:

   1. Basis of design: Protecta AN111A.

   2. 3M Fall Protection.

   3. Miller Fall Protection.

B. Component:

   1. Stainless steel D-bolt anchor up to 4-inches working thickness, with 5/8-inch diameter bolt with lock washer and nut.

   2. Capacity: Each anchorage connector to support 5,000 pounds per worker and shall be designed for fall arrest.

2.06 REMOVABLE CONCRETE DETENT ANCHORS

A. Basis of design:

1. DBI-Sala Concrete Detent Anchor with removable D-ring.

2. Guardian Fall Protection.

B. Component:

1. Concrete detent anchor for hole with reusable detent pin D-ring assembly, socket and cap.

2. Capacity: Each anchorage connector to support a load of 5,000 lbs.

2.07 LADDER TIE-OFF SYSTEM

A. Component:

1. Premanufactured anchor product or custom fabricated steel shape as indicated on Issued for Construction Drawings.

2. Capacity: Each tie-off connector to support a load of 1,800 lbs or applicable codes, whichever is more stringent.

3. Dimensions: To accommodate minimum width for ladder as defined by WAC 296-880.

2.08 ROOF MOUNTED ANCHOR POSTS

A. Component:

1. Roof anchorage points for personal fall protection systems; used exclusively for employee fall protection and independent of any anchorage used to suspend employees or platforms on which employees work:

a. Anchor Type per ANSI/ASSP Z359.18: Type T.

2. Roof anchorage points for primary suspension lines for bosun's chairs used for window washing or facade access.

B. Structural Performance: Provide safety tieback anchors capable of withstanding design loads as required by governing regulations and codes.

2.09 FASTENERS

A. Bolts, Nuts, and Washers: Type 304 or 316, stainless steel:

1. Bolts and Washers: ASTM F593.

2. Nuts: ASTM F594.

B. Exposed Fasteners: As designed by manufacturer to accommodate deck type, structural framing, and design loads.

2.10 FLASHING AND SEALING MATERIALS

A. Non-Expanding Sealing Gaskets: Pre-cut and predrilled, 40 durometer, 1/8-inch, solid neoprene rubber meeting or exceeding ASTM D2000. For sealing under anchor bases.

B. Expanding Compression Gaskets: EPDM or Neoprene rubber meeting or exceeding ASTM D1056 Type I (Closed Cell), Class B or C (Petroleum Resistant).

C. Joint Sealants: Non-skinning butyl sealant or neutral curing silicone sealant as specified in Section 07 92 00 - Joint Sealants. Polyurethane sealant not accepted.

2.11 FABRICATION

A. Fabricate work true to dimension, square, plumb, level and free from distortion or defects detrimental to appearance and performance.

B. Grind off surplus welding material and ensure exposed internal corners have smooth lines.

C. Fabricate system components of the same material unless otherwise indicated.

D. Fabricate anchoring devices as recommended by the manufacturer to provide adequate support for intended use.

E. Fabricate joints in a manner to discourage water accumulation. Provide weep holes to drain all water that could accumulate in the exposed joints.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine substrates and conditions for compliance with requirements for installation tolerances and other conditions upon which the work of this Section depends. Report to the Contractor in writing defects in work prepared by other trades and other unsatisfactory site conditions that would cause defective installation of products or cause latent defects in workmanship and function.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

2. Commencement of work shall imply acceptance of prepared work.

3.02 INSTALLATION, GENERAL

A. Install equipment in accordance with approved shop drawings and manufacturer's instructions.

B. Coordinate installation with work of related trades.

C. Install all work true, level, tightly fitted, and flush with adjacent surfaces as required.

D. Deform threads of tail end of anchor studs after nuts have been tightened to prevent accidental removal or vandalism.

E. Lifeline systems and anchors: installed by manufacturer’s authorized, trained, and certified personnel.

F. For requirements for anchors in concrete refer to anchorage to concrete as stated elsewhere in the Contract documents. For other building attachment locations install with mechanical fasteners only.

G. Install anchorage and fasteners in accordance with manufacturer’s recommendations to obtain the allowable working loads published in the product literature and in accordance with these Contract Specifications.

H. Do not load or stress lifeline systems or anchors until all materials and fasteners are properly installed and ready for service.

I. Install all lifeline systems and anchors a minimum of 6 feet from the roof edge, unless noted otherwise on Drawings.

3.03 FIELD ADJUSTING AND INSPECTION

A. Adjust and leave equipment in proper working order.

B. Inspect and test field welds in accordance with AWS B1.10M/ B1.10

3.04 TESTING

A. Test using load cell test apparatus in accordance with manufacturer's recommendations.

1. If no test procedure or pass/fail thresholds are specified by the manufacturer, test in accordance with ANSI Z359.7 - Qualification and Verification Testing of Fall Protection Products.

3.05 CLEANING

A. Unless otherwise indicated, clean metals by washing thoroughly with clean water and soap, rinsing with clean water, and drying with soft cloths.

3.06 TRAINING

A. Provide a minimum of 4 hours of operator training specific to the installed system after system has been installed and proof tested. Provide hands-on training for the users of the system and conduct at the installation site.

3.07 PROTECTION

A. Protect roof mounted horizontal maintenance equipment and accessories from damage during construction period with temporary protective coverings approved by manufacturer. Remove protective covering at time of Substantial Completion.

B. Restore finishes damaged during installation and construction period so no evidence remains of damaged work. Return items that cannot be refinished in the field to the shop; make required alterations and refinish entire unit or provide new units.

3.08 COMMISSIONING

A. Systems in this section will be required to be commissioned per the requirements of Section 01 91 13 – General Commissioning Requirements and Section 11 08 00 – Commissioning of Equipment.

B. Unless specified elsewhere, the sampling rate for commissioning equipment in this section shall be 100 percent.

C. The contractor will be responsible for providing labor and testing equipment to support the commissioning process for this equipment.

END OF SECTION

SECTION 14 08 00

COMMISSIONING OF CONVEYING EQUIPMENT

NOTE TO DESIGNER:

SECTIONS WITH BRACKETS. E.G., [TEXT] ARE TO BE MODIFIED OR DELETED IF NOT APPLICABLE. ITALICIZED TEXT PROVIDES INSTRUCTION TO THE DESIGNER TO INCLUDE LANGUAGE ON SPECIFIC TOPICS WHEN APPLICABLE. THE INSTRUCTIONS ARE TO BE DELETED WHEN THE SPECIFICATION IS FINALIZED. LANGUAGE NOT IN BRACKETS IS TO BE USED 'AS IS' WITHOUT MODIFICATION OR WITH AN APPROVED SPECIFICATION MODIFICATION REQUEST.

DESIGNER TO DELETE TEXT ABOVE FOR FINAL SECTION

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Requirements for commissioning process requirements for Conveying Equipment:

a. Level 1 commissioning activities for Conveying Equipment.

b. Level 2 commissioning activities for Conveying Equipment.

c. Support for Level 3 commissioning activities related to Conveying Equipment.

d. Support for Level 4 commissioning activities related to Conveying Equipment.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. American Society of Mechanical Engineers (ASME):

a. ASME A17.2 Guide for Inspection of Elevators, Escalators, and Moving Walks – Includes Inspection Procedures for Electric Traction and Winding Drum Elevators, Hydraulic Elevators, Inclined Elevators, Private Resident Elevators, and Escalators and Moving Walks.

2. Washington Administrative Code (WAC).

B. Definitions:

1. See general commissioning requirements as stated in the Contract Documents for commissioning definitions.

2. Systems, Equipment, and Components: Where these terms are used together or separately, they shall mean "as-built" systems, equipment, and components.

1.03 COORDINATION

A. See general commissioning requirements as stated in the Contract Documents for general coordination requirements related to commissioning.

1.04 COMMISSIONING ACTIVITIES

A. Furnish labor and material to accomplish building commissioning as stated in the Contract Documents, and in this specification, including, but not limited to:

1. Provide to the Testing and Commissioning Manager Preliminary Operation and Maintenance information for use in developing commissioning test procedures.

2. Assist the Testing and Commissioning Manager in developing commissioning activity procedures and data forms submittals for work specified in this Section.

3. Provide information to the Testing and Commissioning Manager needed for Control Interface Wiring Diagrams for the work of this Section.

4. Perform Level 1 and Level 2 commissioning activities specified in this Section, including installation verification, static tests, start-up tests, component tests, systems tests.

5. The person or firm installing the equipment shall provide a written checkout procedure and demonstrate that all E/E/PES electrical protective devices operate as intended.

6. Operate equipment and system during Commissioning Tests and Commissioning Test Demonstration specified in this specification.

7. Perform and document Commissioning Tests to verify readiness for Commissioning Test Demonstration. Commissioning Tests are specified in this specification.

8. Correct issues and repeat Commissioning Tests when results do not meet Acceptance Criteria.

9. Commissioning Test Demonstrations: General requirements for commissioning test demonstrations are specified in general commissioning requirements as stated in the Contract Documents.

    a. Repeat commissioning tests on a sample basis to demonstrate acceptable performance: Level 1 Component, Equipment, and System Commissioning Tests.

    b. Record and submit for approval commissioning test demonstration data and issues.

    c. Correct issues and repeat commissioning test demonstration when results do not meet Acceptance Criteria.

10. Attend commissioning meetings as requested by the Testing and Commissioning Manager before and during testing specified in this specification.

11. Report any inconsistencies or issues in system operations or performance.

12. Provide personnel to support Commissioning Test Verification specified in this specification as requested by the Testing and Commissioning Manager.

13. In the event that a Commissioning Test Demonstration fails, assist in determining the cause of failure. Make corrections as necessary.

B. Cooperate with Testing and Commissioning Manager to accomplish commissioning work on schedule and in coordination with other trades.

1.05 QUALITY ASSURANCE

A. Coordinate completion of Install Verification forms, by the Quality Control Inspector, as identified in the Contractors Quality Control Inspection and Test Plan

PART 2 - PRODUCTS

2.01 TEST EQUIPMENT

A. Provide test equipment and instrumentation, including consumable supplies, required to execute commissioning activities. Unless noted otherwise, test equipment and instrumentation remain the property of the Contractor.

B. Provide proprietary test instruments or tools required by the equipment manufacturer. Provide and operate the proprietary test instruments or tools as required for commissioning work.

PART 3 - EXECUTION

3.01 LEVEL 1 COMMISSIONING ACTIVITIES REQUIREMENTS

A. Level 1 commissioning activities scope: Technical requirements for commissioning of Equipment are specified in this specification.

B. Provide technicians, instrumentation, and tools to perform commissioning activities in accordance with accepted commissioning activity procedures at the direction of the Testing and Commissioning Manager.

C. Scope of Equipment commissioning activities applies to all portions of the installation described in the test. Where sampling is specified, it applies only to the commissioning test demonstration.

D. Upon approval of product submittals associated with Technical requirements and the scope of Commissioning develop and submit for approval Install Verification Checklist forms for the quality criteria of the Work specified in this specification.

E. Preparation:

1. Certify that Equipment, subsystems, and equipment have been completed, calibrated, and started; and are operating in accordance with Contract Documents.

2. Testing Instrumentation: Install measuring instruments and logging devices to record test data in accordance with accepted commissioning test procedures as directed by the Commissioning Authority.

3. Certify that Equipment instrumentation and control systems have been completed and calibrated; are operating according to the Contract Documents; and that pretest set points have been recorded.

4. Set systems, subsystems, and equipment into operating mode to be tested (e.g., normal shut down, normal auto position, normal manual position, unoccupied

cycle, emergency power, and alarm conditions) in accordance with accepted commissioning test procedures as directed by the Testing and Commissioning Manager.

F. Test all operating modes, interlocks, control responses, and responses to abnormal or emergency conditions, and verify proper response of building automation system controllers and sensors.

G. Perform tests using design conditions whenever possible. If tests cannot be completed because of a deficiency outside the scope of the Equipment system, document the deficiency and report it to Sound Transit. After deficiencies are resolved, reschedule tests.

H. Simulated conditions may need to be imposed using an artificial load when it is not practical to test under design conditions. Provide equipment to simulate loads. Set simulated conditions in accordance with accepted commissioning test procedures as directed by the Testing and Commissioning Manager. Document simulated conditions and methods of simulation. After tests, return settings to normal operating conditions.

I. Request approval to alter set points when simulating conditions is not practical. Request approval to alter sensor values with a signal generator when design or simulating conditions and altering set points are not practical.

J. If tests cannot be completed because of a deficiency outside the scope of the Equipment system, document the deficiency and report it to Sound Transit. After deficiencies are resolved, reschedule tests.

K. Where seasonal testing is specified, complete appropriate initial commissioning tests and documentation within the Construction Period. Schedule and execute seasonal tests when specified conditions are expected.

3.02 LEVEL 1 AND LEVEL 2 COMMISSIONING ACTIVITY PROCEDURES

A. Submit Level 1 commissioning activity test procedures and data forms for the following types of commissioning activities, requirements for which are specified in this specification:

1. Level 1 commissioning activities:

   a. Installation verification.

   b. Start-up.

   c. System tests.

2. Level 2 commissioning activities:

   a. Intra-station system interface tests.

   b. [Review identified systems and add to list or modify as necessary based on location design for conveying equipment. Coordinate with Division 14].

3. Example checklists/test forms can be provided upon request.

3.03 LEVEL 1 INSTALLATION VERIFICATION CHECKLIST REQUIREMENTS

A. Scope: Installation verification requirements to the following:

1. [1408-IV-01: Electric Traction Elevators or Hydraulic Elevators].

   a. Hoistway, pit, hoistway equipment.

b. Elevator machine room and equipment, including all cable and wire installation and termination.

c. Elevator cab, doors and landing equipment.

d. Complete and provide to owner Alignment Forms included in Appendix:

1) A – Shaft Inspection Verification Form.

2) B - Rail Holdpoint Inspection.

2. 1408-IV-02: Escalators:

a. Escalator wellway, pit and equipment.

b. Escalator machine room and equipment, including all cable and wire installation and termination.

c. Compete and provide to owner Alignment Forms included in Appendix:

1) C - Escalator Truss Bolt Inspection.

2) D - Escalator Center-Line Inspection.

3. [Designer: Adjust IV to reflect Traction or Hydraulic, if location has both add a unique IV and adjust IV numbering. Organize and adjust appendices to reflect equipment to be installed].

B. Installation Verification Checklist forms shall include the following:

1. Organized to prompt the installer to check off quality criteria for each discrete portion of the Work.

2. Identify the system or features to which the Installation Verification Checklist applies at the top of the form.

3. Section for verification of delivery of approved materials.

4. Section for condition of materials at delivery.

5. Section for verification that installation meets contract documentation and any special installation instructions by respective manufacturer.

6. Space at the end of the form for the installer to print their name and company name, fill in the date, and sign or initial.

7. Space at the end of the form for the Quality Control inspector designated for the scope to review and accept installation verification. QC Inspector must perform Install Verification and verify each element identified in form has been reviewed for conformance with contract documents and in accordance with the Contractors Quality Control Inspection and Test Plan as part of Section 01 45 00 - Quality Assurance/Quality Control.

8. Space to identify the area of work for which the installer is executing the Installation Verification Checklist.

9. Description of the quality criteria as it pertains to the specific work. Include a checkbox for each criteria.

10. Example checklists/test forms can be provided upon request.

C. Quality Criteria: Installation Verification Checklists shall address the following quality criteria.

1. Make and model match approved submittals.

2. Equipment is installed without visible damage.

3. Location is as indicated on drawings.

4. Equipment is accessible for maintenance using safe work practices.

5. There is sufficient space to remove and replace components intact without demolishing other work.

6. Power unit is accessible for adjustment, maintenance, and testing, including replacement of components or the entire assembly.

7. Hoistway is accessible for adjustment, maintenance, testing and replacement of fire alarm, fire detection and fire suppression devices and equipment.

8. Locations of fire detection and fire suppression devices and equipment are effective for intended functions.

9. Hoistway shaft penetrations are sealed.

10. Hoistway, equipment room or pits are provided by others per Contract Documents, including dimensions, materials and supporting infrastructure.

D. Fill out, sign, and submit the Installation Verification Checklists for Conveying Equipment weekly while the Work is being installed. The intent is to fill out and sign the Installation Verification Checklist as work proceeds to improve the quality of the installation.

E. Before performing a Commissioning Test, installation verification checklists must be performed and completed by QC inspector designated for the appropriate area specified here in and within the Contractors Quality Control Inspection and Test Plan as part of Section 01 45 00 - Quality Assurance/Quality Control. Submit completed Installation Verification Checklists for work included in the Commissioning Test.

3.04 LEVEL 1 START-UP REQUIREMENTS

A. [1408-SU-01: Electric Traction Elevators or Hydraulic Elevators]:

1. System/Equipment to be Tested:

a. Elevators and associated elevator equipment and controls in accordance with elevator requirements as stated in the Contract Documents.

2. Functions to be Tested:

a. Installation verification and start-up

b. Alignment inspections and verifications included in Appendix:

1) E – Roped Elevator Clearance Verification Form.

2) F – Roped Elevator Safety Test Data Sheet.

3) G – Holed Jack Alignment.

4) H – Holeless Jack Alignment.

5) I - Hydraulic Pressure Tests & Inspections.

6) J – Hydraulic Running Platform Inspection.

7) K – Rupture Valve Calibration.

8) L – Inspection Procedure for Guide Rails and Holeless Jack Alignment.

3. Conditions of the Test:

a. As required by the manufacturer's written installation verification and start-up instructions.

4. Acceptable Results:

a. Manufacturer's criteria are met.

b. Complete and provide Alignment inspection and verification forms for owner records.

5. [Designer: *Adjust SU to reflect Traction or Hydraulic, if location has both add a unique SU and adjust SU numbering. Adjust Appendix organization accordingly]*

B. 1408-SU-02: Escalators

1. System/Equipment to be Tested:

a. Escalators and associated escalator equipment and controls in accordance with escalators requirements as stated in the Contract Documents.

2. Functions to be Tested:

a. Installation verification and start-up.

1) Confirm variable frequency drive settings are set to accommodate the maximum range of nominal voltage fluctuations from utility provider or adjust and record final settings.

b. Alignment inspections and verifications included in Appendix:

1) M – Escalator Step Track Alignment Inspection.

2) N – Escalator Step Chain Track Alignment Inspection.

3) O – Escalator Skirt Alignment Inspection.

4) P – Step Chain Sprocket Alignment Inspection.

5) Q – Escalator Hold Down Track Alignment Inspection.

3. Conditions of the Test:

a. As required by the manufacturer's written installation verification and start-up instructions.

4. Acceptable Results:

a. Manufacturer's criteria are met.

b. Complete and provide Alignment inspection and verification forms for owner records.

3.05 LEVEL 1 SYSTEM TESTING REQUIREMENTS

A. 1408-S-01: Escalators Operation:

1. Escalators Operation as a System, validating operating scenarios and features.

2. Functions to be Tested and Acceptance Criteria:

a. Airborne Noise Control: During normal operation measure noise levels. All DBA readings to be taken 3 feet 0 inches above escalator at any point of its length using the “A”-weighted scale. Measured noise levels relating to escalator equipment and its operation do not exceed 65 dBA [If station is located near highway or similar loud ambient noise source, measured noise levels associated with escalator to be no more than 5 dBA above the measured ambient].

b. Step and Handrail Speed: During normal operation measure step and handrail speed for Unloaded and Loaded conditions in both the upward and downward direction. Loaded condition to be measured by loading a normally operating unit, with a minimum of 10 people, spaced at 1 per step, up to a number representing a person occupying every occupiable step of travel. Load may be simulated using a representative load of 200 pounds per person for 90% of total steps. Step speed must be 100 FPM plus or minus 10 percent under all loading condition (Unloaded and Loaded). (for 20-foot travel, time is no less than 10.9 seconds nor greater than 13.3 seconds) in upward direction and in downward direction. Handrail speed is consistent with step speed. Any difference in speed must not exceed one inch of alignment change between step and handrail over the full length of travel.

c. Brake Operation: Verify deceleration, stopping and holding performance of the brakes during normal operations, and in Unloaded and Loaded conditions. Safely decelerate, stop, and hold rated load in accordance with Code requirements. Brakes stop escalator operating in the down direction at a rate not greater than 3 feet per second per second.

d. Sleep Function: During normal Unloaded conditions, verify unit detects inactivity upon identified parameters and decelerates to a minimum speed allowed. Verify unit re-engages upon detection of approaching user at an acceptable acceleration as indicated in Contract documents or regulated by Labor and Industries. *[Designer: Remove this if not applicable or modify to match parameters defined for Sleep Mode functionality]*

e. Local Control: Verify the use of the key-operated switches and emergency stop buttons located at upper and lower newel or stanchion-mounted operating station to perform the following functions:

1) At upper operating station, start escalator in up direction.

2) At upper operating station, stop escalator.

3) At upper operating station, start escalator in down direction.

4) At upper operating station, stop escalator by using the emergency stop button. When the cover to the button an audible warning signal must be activated. The signal must have a minimum sound intensity of 80 dBA at the button location. Emergency stop button shall cause an alarm at the LCC when activated.

5) At lower operating station, stop escalator.

6) At lower operating station, start escalator in up direction.

7) At upper operating station, stop escalator.

8) At lower operating station, stop escalator by using the emergency stop button. When the cover to the button is pressed an audible warning signal must be activated. The signal must have a minimum sound intensity of 80 dBA at the button location. Emergency stop button shall cause an alarm at the LCC when activated.

B. 1408-S-02: Electric Traction and Hydraulic Elevators Operation:

1. System/Equipment to be Tested:

a. Elevators and associated elevator equipment and controls in accordance with electric traction elevators requirements as stated in the Contract Documents.

b. Elevators and associated elevator equipment and controls in accordance with hydraulic elevators requirements as stated in the Contract Documents.

2. Functions to be Tested:

a. Call and dispatch controls.

b. Lobby and cab position indicators.

c. Proximity detection device operation.

d. Fire alarm response.

e. Elevator car telephone.

f. Elevator alarm.

g. Intercom.

h. Access Card Reader.

i. CCTV.

3. Conditions of the Test:

a. From each floor, call the car to the test floor; dispatch the car to each other station. Verify correct response and function. Verify elevator system-generated message and visual indication properly announces car direction and floor.

b. At each floor, place an object in the path of the closing door and verify safety functionality of door.

c. Observe elevator response to fire alarm condition in normal power mode.

d. Operate telephone according to posted instructions in normal power condition.

e. Operate the elevator alarm button in normal power condition.

f. Operate the intercom in normal power condition.

g. Observe elevator response to fire alarm condition in emergency power mode.

h. Operate telephone according to posted instructions in emergency power condition.

i. Operate the elevator alarm button in emergency power condition.

j. Operate the intercom in emergency power condition.

k. Operate telephone according to posted instructions during fire alarm.

l. Operate the elevator alarm button during fire alarm.

m. Operate the intercom during fire alarm.

n. Verify functionality of card reader.

o. Verify functionality of CCTV.

4. Acceptable Results:

a. Car responds to calls and dispatches appropriately. Doors open and close as required. Arrival signals function as expected.

b. Proximity detection device stops door closure.

c. Elevator responds to fire alarm as required in normal power mode.

d. Telephone connects as required in normal power condition.

e. Elevator alarm is initiated in normal power condition.

f. Intercom communicates as required in normal power condition.

g. Elevator responds to fire alarm as required in emergency power mode.

h. Telephone connects as required in emergency power condition.

i. Elevator alarm is initiated in emergency power condition.

j. Intercom communicates as required in emergency power condition.

k. Telephone connects as required during fire alarm.

l. Elevator alarm is initiated during fire alarm.

m. Intercom communicates as required during fire alarm.

n. [Access card reader allows intermittent floors to be accessed OR access card reader allows access to elevator cab outside of scheduled hours]

o. Elevator Cab Is visible via camera on CCTV system.

C. 1408-S-03: Elevator Airborne Noise Control:

1. System/Equipment to Be Tested:

a. Elevators and associated elevator equipment and controls.

2. Functions to Be Tested:

a. Control of airborne noise generated by elevator operation.

3. Conditions of the Test:

a. With other equipment not operating, and no passengers in elevator, measure sound:

1) 3 feet - 0 inches away from hoistway entrance with elevator in operation.

2) 5 feet - 0 inches off of the floor and 1 foot 0 inches from the wall within the elevator cab.

3) 5 feet - 0 inches away from elevator equipment located in machine room.

4. Acceptable Results

a. Noise levels relating to elevator equipment and its operation do not exceed:

1) 55 dBA continuous and 62 dBA intermittent at hoistway entrance.

2) 55 dBA continuous and 62 dBA intermittent within elevator cab.

3) 80 dBA within elevator machine room.

D. 1408-S-04: Washington State Elevator Inspection Readiness:

1. System/Equipment to be Tested:

a. Elevators and associated elevator equipment and controls in accordance with electric traction elevators requirements as stated in the Contract Documents.

b. Elevators and associated elevator equipment and controls in accordance with hydraulic elevators requirements as stated in the Contract Documents.

2. Functions to be Tested:

a. Readiness for Washington State Elevator Inspection

3. Conditions of the Test:

a. Provide technicians, instrumentation, and tools to perform commissioning tests required for inspection by Labor & Industries or any other AHJ required to put units into operation.

b. Perform the tests that the Washington State Elevator Inspector will require, according to Labor and Industries procedures.

4. Acceptable Results:

a. Performance meets or exceeds Labor and Industries requirements in advance of elevator inspection by the Washington State Elevator Inspector.

3.06 LEVEL 3 INTER-STATION SYSTEM INTERFACE TEST REQUIREMENTS

A. Perform Level 3 testing to ensure the correct exchange of data and communication between the equipment supplied and integration with existing head end systems, including:

1. The CCTV security camera system at the Security Operations Center and LCC.

2. [The software and network at SOC, and the Access Control System equipment provided for the Stations and Parking Garages under this Contract.]

3. Remote monitoring equipment and system furnished by others and coordinated by Sound Transit Vertical Conveyance Operational team.

B. Level 3 Test Support: During the Level 3 testing period, must be coordinated with Sound Transit, and the team of Transit Systems within Operations. Provide adequate personnel to adjust equipment and troubleshoot system failures that might arise. Conduct Level 3 tests with the assistance from Contractor, Construction Management, External Systems Contractors, Operations, and the final design consultant. Systems will be tested together during Level 3 Testing to ensure proper functionality, inter-operability, and reliability of systems necessary for operation.

C. 2808-IIS-01 Security and Communication Elements – Remote Interface:

1. System/equipment to be tested:

   a. CCTV Camera inside cab.

   b. [Access Card Readers].

   c. Remote Monitoring Equipment.

2. Functions to be tested:

   a. Video Image from Camera.

   b. [Elevator functionality with Card Reader].

   c. Remote monitoring information of elevator and escalator operations.

3. Acceptance Criteria:

   a. Video image is integrated into head end system and available for viewing at SOC and LCC.

   b. [Elevator functions as intended with card reader use:

      1) [Stopping on maintenance level floors].

      2) [Not allowing entry after hours.]

   c. Owner remote monitoring system has visibility to elevator and escalator operation and alarms.

4. [Designer: Determine access card scope and intended sequence for providing access to non-public levels for maintenance personnel and/or securing elevator externally during non-revenue hours if elevator lobby cannot be secured in other means.]

3.07 LEVEL 1, 2 AND LEVEL 3 TEST REQUIREMENTS MATRIX

CL1						
CL2						
CL3*						
CL4*						
CL5*						
CL6*						

Inspections for locations marked with asterisks to be provided if necessary, depending on number of truss sections.

PROCEDURE:

1. Escalator is positioned in the wellway on the top, intermediate and bottom supports.
2. Verify that all factory made scribe marks line up at truss junction points.
3. Torque wrench calibration shall be confirmed by a valid calibration certificate.
4. All truss bolts shall be pre-tightened prior to the inspection to slightly under the required torque value.
5. The torque wrench shall be set according with manufacturer's requirement of 710 Nm (524 ft-lbf).

Note: Inspections to be performed on all truss connection bolts

PROCEDURE:

1. Install center-line stanchions at the top and bottom of truss per factory punched center marks.
2. Stretch a piano wire between the stanchions, making taut with a turnbuckle.
3. Drop a brass plumb bob from the piano wire to the factory made scribe marks (CLs) to verify alignment.
4. Place punch mark where plumb bob meets cross member if different from factory mark

Note: Measurements marked with asterisks to be provided if necessary, depending on number of truss sections.

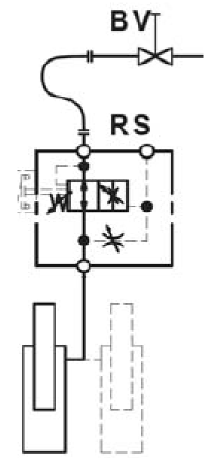
APPENDIX K

RUPTURE VALVE CALIBRATION (rev.2)

CONTRACT#	ELEVATOR#	DATE:

WORKING PRESSURE	
(1.5X) WORKING PRESSURE	
STATIC PRESSURE	
CALCULATED BYPASS PRESSURE (125% to 150% of working pressure)	
RECORDED BYPASS PRESSURE	
RUPTURE VALVE TRIP SPEED	



Testing Procedure:

1. Conduct adjustments with a fully loaded car.
2. Adjust car speed to 130 – 140 FPM with full load.
3. Adjust rupture valve to desired trip speed.
4. Perform rupture valve test.
5. Lock and tag rupture valve
6. Reset car speed and confirm it back to normal.

ASME Code Section	INSPECTION/VERIFICATION	*check one*		
		YES	NO	N/A
3.19.4.7	Is tested rupture valve is tagged and sealed?			
3.24.1.1	Is a marking Plate of Working Pressure on the Machine?

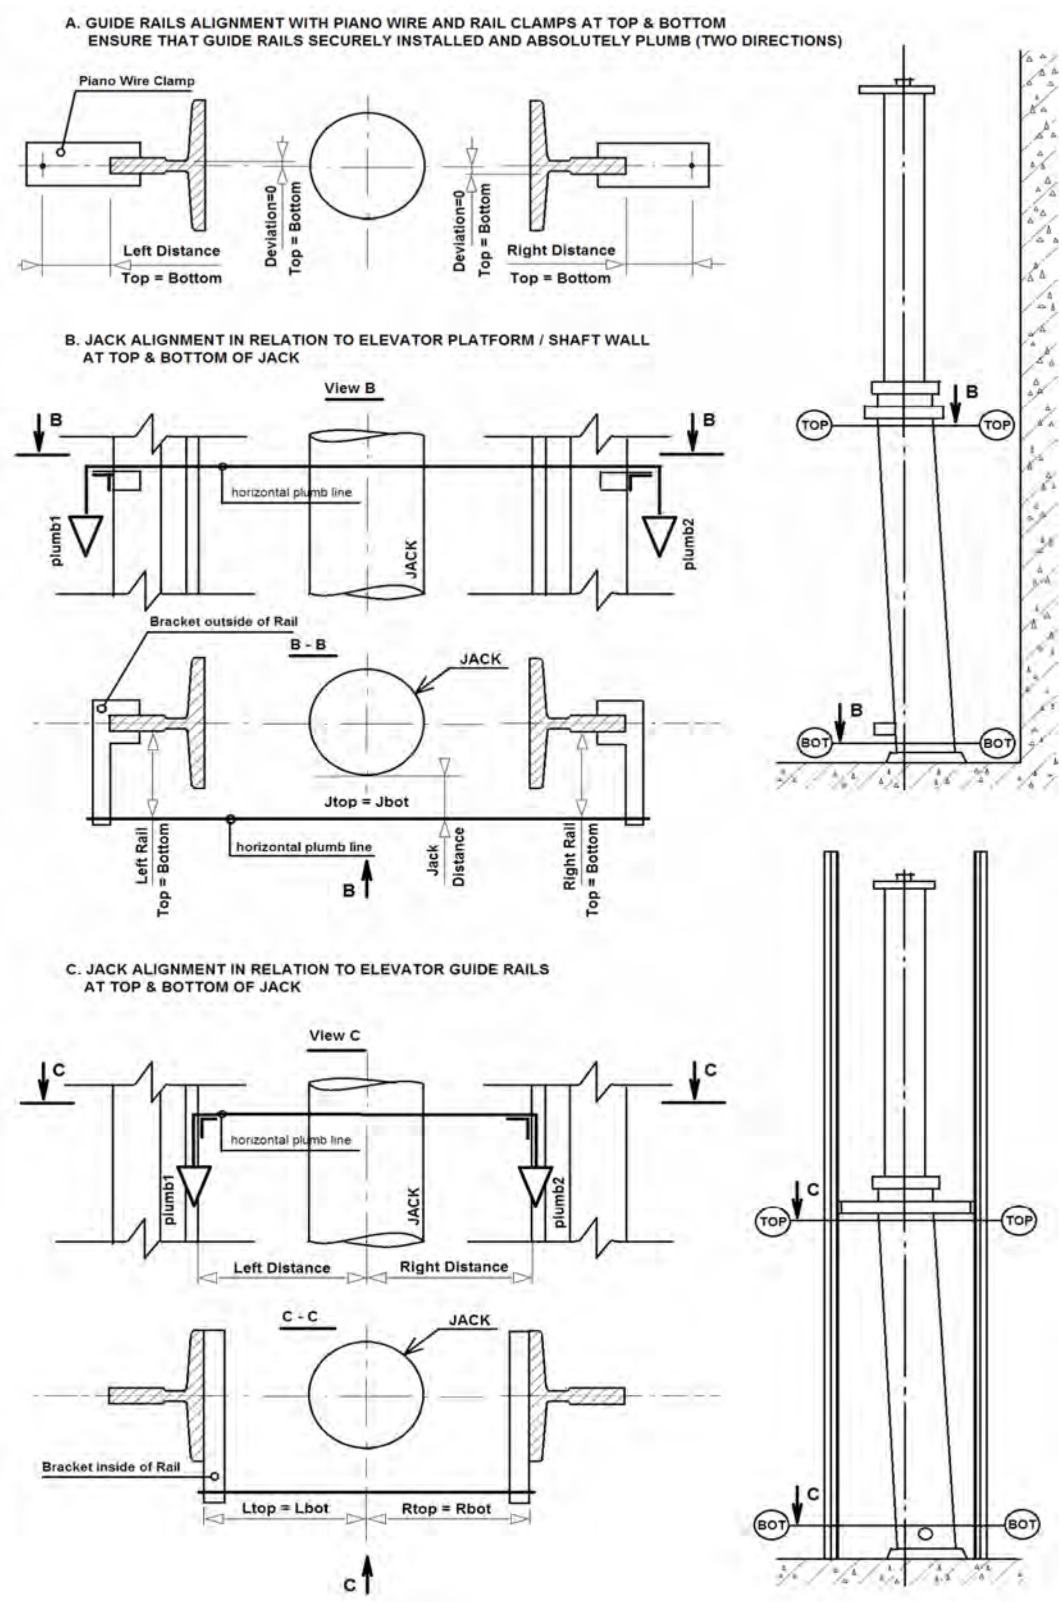
APPENDIX L

INSPECTION PROCEDURE FOR GUIDE RAILS & HOLELESS JACK ALIGNMENT (CANTELIEVER ELEVATOR)

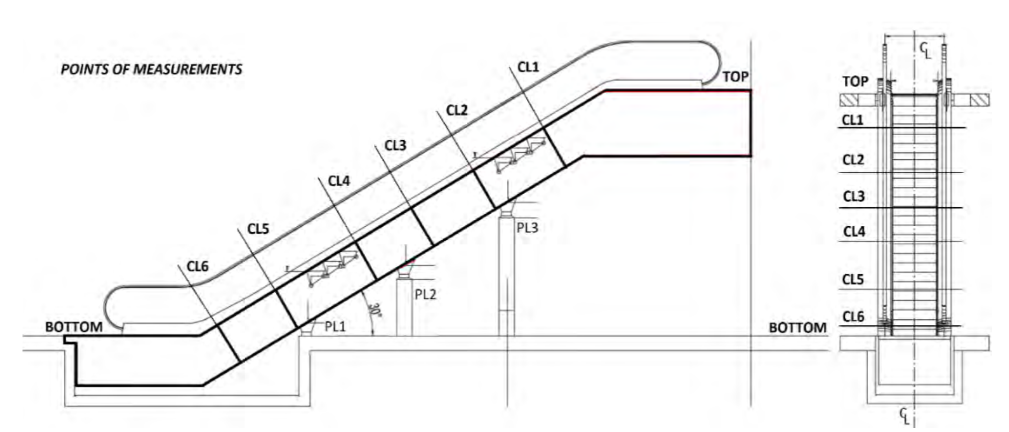


Attachments: 1. WURTEC Rail Alignment Starter Instruction Sheet 2. Approved Rail Hold Point Alignment Inspection Form 3. Approved Holeless Jack Alignment Inspection Form	

APPENDIX M

ESCALATOR STEP TRACK ALIGNMENT INSPECTION

CONTRACT#	ESCALATOR#	DATE:
STATION:	MODEL#	



LOCATION	Measurement criteria: 503 mm.		Track Deviation	Acceptance criteria ± 1.5 mm.		Track level within bubble "ring"	
	Left of CL mark	Right of CL mark	±ΔT	Pass	Fail	Pass	Fail
CL1							
CL2							
CL3*							
CL4*							
CL5*							
CL6*							

PROCEDURE:

1. Drop a brass plumb bob from the piano wire to the as-build scribe marks (CLs) if truss center-line alignment does not exceed acceptance criteria.
2. In case when truss center-line alignment for as-build punch marks exceeded acceptance criteria – all tracks' positions shall be corrected before start of track alignment inspection.
3. Measure from inside of track to centerline on each side.
4. Repeat at each truss split along incline.

Note: Measurements marked with asterisks to be provided if necessary, depending on number of truss sections.

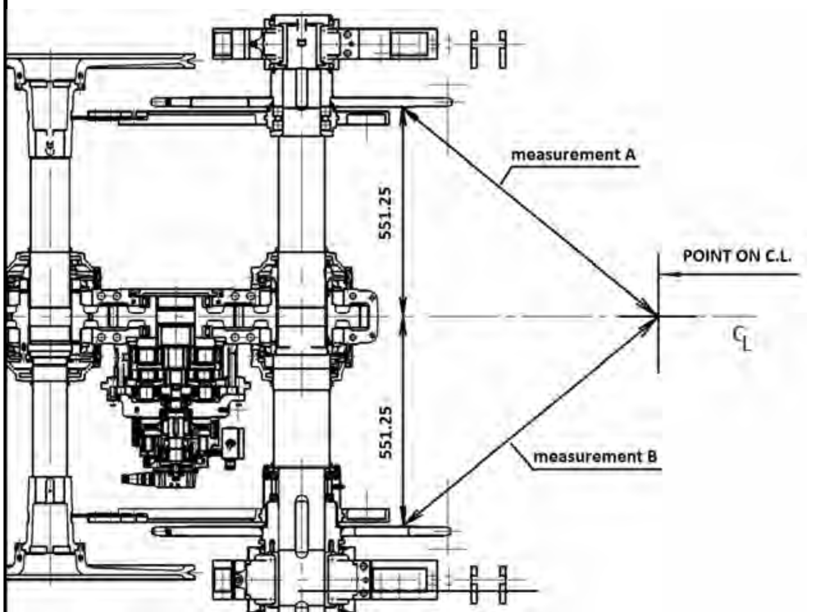
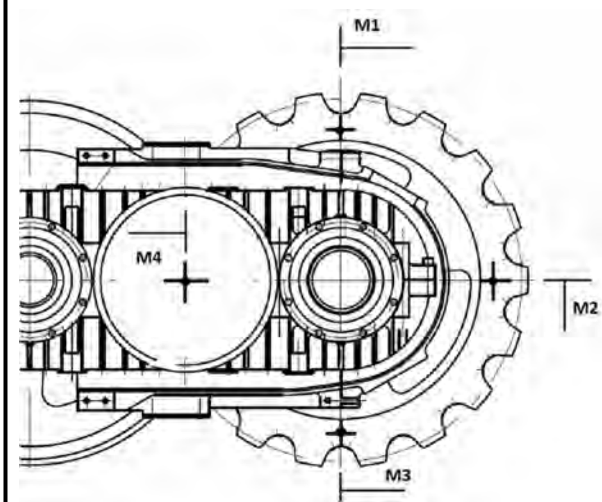
STEP CHAIN SPROCKET ALIGNMENT INSPECTION

CONTRACT#	ESCALATOR#	DATE:
STATION:		**MODEL#**





LOCATION	Measurement criteria: 551.25 mm.		Deviation to C.L.	Triangulation measurements (A=B)		Acceptance criteria ± ____ mm.	
	Left of CL mark	Right of CL mark	±∆M	A	B	Pass	Fail
M1							
M2							
M3							
M4							

PROCEDURE:

1. Drop a brass plumb bob from the piano wire to chosen point on centerline.
2. Mark point on centerline.
3. Using a self-leveling laser centered on piano wire, project beam towards step chain sprocket.
4. Measure from inside of sprocket on each side to the projected centerline.

1. Measure distances “A” and “B” from inside of sprocket to the check mark on center line.
2. Rotate sprocket by 90 degrees at the time and repeat measurements for four consecutive locations M1, M2, M3 and M4

END OF APPENDIX

SECTION 14 21 00

ELECTRIC TRACTION ELEVATORS

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for furnishing and installing and providing Maintenance for Gearless Passenger traction elevators as specified and detailed on the Issued for Construction Drawings.

B. Related Work Provided Under Other Sections

1. Hoistway and Pit:

a. Clear, plumb, substantially flush hoistway with variations not to exceed 1 inch at any point.

b. Bevel cants not less than 75 degrees from the horizontal on any rear or sidewall ledges and beams that project or recess 4 inches or more into the hoistway. Not required on hoistway divider beams.

c. Supports at each floor for car and counterweight guide rail fastening. Intermediate car and counterweight guide rail support when floor heights exceed 14 feet 0 inch. Building supports not to deflect more than 1/8 inch under normal conditions, 1/4 inch under seismic conditions.

d. Installation of guide rail bracket supports in concrete. Inserts or embeds, if used, will be furnished under this Section.

e. Wall blockouts and fire rated closure for control and signal fixture boxes that penetrate walls.

f. Cutting and patching walls and floors. Finished floors slope away from elevator doors.

g. Wall pockets and/or structural beams for support of machine, sheave, and dead-end hitch beams. Do not exceed support deflection of 1/1666 of span under static load. Erect from elevator hoistway wall after elevator entrances.

h. Grout around hoistway entrances and sills.

i. Pit access ladder for each elevator.

j. Structural support for car and counterweight buffer impact loads, guide rail loads, and compensation sheave tie-down upthrust.

k. Waterproof pit. Dry sump with flush grate or indirect drain. Provide pump or indirect drain to remove accumulated liquid.

l. Protect open hoistways and entrances during construction in accordance with OSHA Regulations 29 CFR Part 1926.

m. Protect car enclosure, hoistway entrance assemblies, and special metal finishes from damage after installation.

n. Hoistway venting or pressurization to prevent accumulation of smoke and gas as required by Local Building Code.

o. Seal fireproofing to prevent flaking.

2. Machine Room, Control Room and Machinery Spaces:

   a. Provide enclosure with access.

   b. Self-closing and locking access door.

   c. Provide self-closing and locking access door with panic door hardware.

   d. Ventilation and heating:

      1) Minimum temperature: Maintain minimum temperature of 55 degrees F.

      2) Maximum temperature: Maintain maximum temperature of 90 degrees F.

      3) Maintain maximum 80 percent relative humidity, non-condensing.

   e. Paint walls, ceiling, and floor.

   f. Class ABC fire extinguisher.

   g. Seal fireproofing to prevent flaking.

   h. Fire sprinklers as required by code.

   i. Only conduit, wiring, and equipment directly related to the hydraulic elevator allowed in elevator machine rooms.

3. Electrical Service, Conductors, and Devices:

   a. Provide lighting and Ground Fault Circuit Interrupter (GFCI) convenience outlets in pit, machine room, and overhead machinery space.

   b. Provide conduit from elevator controller to fire alarm system interface in/near the elevator machine room. Coordinate size, number, and location of conduits.

   c. Provide three-phase mainline copper power feeder to terminals of each elevator controller in the machine room with protected, lockable OPEN, disconnect switch.

   d. Provide single-phase copper power feeder to each elevator controller for car lighting and exhaust blower with individual protected, lockable OFF, disconnect switch.

   e. See Section 28 31 00 - Fire Detection and Alarm for fire detection and fire recall.

   f. Provide temporary power and illumination to install, test, and adjust elevator equipment.

g. Provide means to manually and automatically disconnect power to affected elevator drive unit and controller prior to activation of machine room overhead fire sprinkler system, and/or hoistway overhead fire sprinkler system. Locate manual shut-off means outside bounds of machine room.

h. When sprinklers are provided in the hoistway, identify all electrical equipment, except seismic protective devices, located less than 4 feet 0 inch above the pit floor for use in wet locations. (ANSI/NFPA 70).

i. Provide power feeders to main control console and firefighters' control panel.

j. Provide power feeder to elevator Public Address (PA) amplifier in the elevator machine room.

k. Provide single-phase power feeders to machine room elevator group control monitor with single-phase, protected, lockable OFF, disconnect switch.

4. Standby Power Provision:

a. Standby power of the same voltage characteristics via normal electrical feeder to run all elevators at full-rated car speed and capacity.

b. Conductor from auxiliary form “C” dry contacts, located in the standby power transfer switch to a designated elevator control panel in each elevator group and/or single elevator unit. Provide time delay of 30-45 seconds for pre-transfer signal in both directions.

c. Standby single-phase power to group controller, and each elevator controller for lighting, exhaust blower, emergency call bell, intercom amplifier, and hoist machine cooling fan.

d. Means for absorbing regenerated power during an overhauling load condition, in accordance with NEC 650-101. Elevator shall employ SCR IBGT drive, presenting a non-linear active load.

e. Provide elevator machine room ventilation or air conditioning per code.to function within the temperature range established by the elevator equipment manufacturer including during standby power modes.

C. Equipment furnished by Sound Transit, installed under this Section:

1. Network Switch.

D. This Section incorporates by reference the latest revisions of the following documents:

1. American Society of Mechanical Engineers (ASME):

a. ASME A17.1 National Safety Code for Elevators and Escalators.

b. ASME A17.2.2 Guide for Inspection of Elevators, Escalators, and Moving Walks.

c. ASME A17.5 Elevator and Escalator Electrical Equipment.

2. American Society of Testing and Materials International (ASTM):

a. ASTM A36 Standard Specification for Carbon Structural Steel.

b. ASTM A167 Standard Specification for Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip.

c. ASTM A568 Standard Specification for Steel, Sheet, Carbon, and High-Strength, Low-Alloy, Hot-Rolled and Cold-Rolled, General Requirements.

d. ASTM A1008 Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability, Required Hardness, Solution Hardened, and Bake Hardenable.

e. ASTM A1011 Standard Specifications for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy with Improved Formability.

f. ASTM B209 Standard Specification for Aluminum and Aluminum-Alloy Sheet and Plate.

g. ASTM B221 Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles and Tubes.

3. National Fire Protection Association (NFPA):

a. NFPA No. 70 National Electrical Code.

b. NFPA No. 72 National Fire Alarm Code.

c. NFPA No. 101 Life Safety Code.

d. NFPA No. 130 Standard for Fixed Guideway Transit and Passenger Rail Systems.

4. Federal Standard and NAAMM nomenclature.

5. International Code Council (ICC):

a. International Building Code (IBC) – Applicable to Projects Not Located Within Seattle.

b. IBC Chapter 30 Elevators and Conveying Systems.

6. Institute of Electrical and Electronics Engineers, Inc. (IEEE):

a. IEEE 446 IEEE Recommended Practice for Emergency and Standby Power Systems for Industrial and Commercial Application.

7. American National Standards Institute (ANSI):

a. ANSI Z97.1 Safety and Glazing Materials used in Building Safety.

8. Telecommunications Industry Association (TIA):

a. TIA-568-C.0 Generic Telecommunications Cabling for Customer Premises.

9. Consumer Product and Safety Commission (CPSC):

a. CPSC 16 CRF Part 1201 Safety Standard for Architectural Glazing Materials.

10. Washington Administrative Code (WAC).

11. Occupational Safety & Health Administration (OSHA):

    a. 29 CFR Part 1926, Safety and Health Regulations for Construction.

12. Americans with Disabilities Act of 1990 (ADA):

    a. ADA Accessibility Guidelines (ADAAG).

    b. Code Amendments from local AHJ's including but not limited to; Seattle Building Code (SBC) – Applicable to Projects Located Within Seattle.

    c. SBC Chapter 30 Elevators and Conveying Systems.

13. American National Standards Institute (ANSI):

    a. ANSI Z97.1 American National Standard for Safety Glazing Materials Used in Buildings.

14. Federal Communications Commission (FCC):

    a. EMI Shielding Guidelines.

15. American Welding Society, Inc. (AWS):

    a. AWS A2.4 Standard Symbols for Welding, Brazing, and Nondestructive Examination.

    b. AWS D1.1/D1.1M Structural Welding Code – Steel.

16. International Standards Organization (ISO):

    a. ISO 281-1:1997 Rolling Bearings Dynamic Load Ratings and Rating Life.

E. Definitions:

1. Terms used are defined in the latest edition of the Safety Code for Elevators and Escalators, ASME A17.1.

2. Reference to a device or a part of the equipment applies to the number of devices or parts required to complete the installation.

1.02 SUBMITTALS

A. Pre-revenue Warranty Maintenance Plan:

1. Submit a detailed Pre-revenue Warranty Maintenance Plan.

B. Shop Drawings: Scaled and Fully Dimensioned Layout that includes plans of pit, hoistway, and machine room indicating equipment arrangement, elevation section of hoistway, details of car enclosures, hoistway entrances, and car/hall signal fixtures:

1. Indicate equipment lists, reactions, and design information on layouts.

2. Power Confirmation Sheets: Include motor horsepower, code letter, starting current, full-load running current, and demand factor for applicable motors.

3. Complete control and schematic wiring diagram of the elevator system and subsystems.

4. Elevator controller, including manufacturer's technical data and product data, and interface hardware and software requirements.

5. Within 60 days after Notice to Proceed and before beginning equipment fabrication, submit shop drawings and required material for review.

C. Testing Submittals:

1. Submit fiber optic performance test procedure and results.

D. Product data for Special Elevator Equipment: Submit product catalogs for speakers, cameras, intercom/emergency telephone, Ethernet switch, traveling cable data cables, card reader and door controllers.

E. The Contractor shall submit material safety data and product data sheets for all products used by the Contractor at the site or which may need to be replaced or added to by the maintenance personnel. Such products include but are not limited to greases, oils and paint. The sheets shall have an index listing each product along with application method, approximate quantity required of the product and the component the product is associated with.

F. Finish Material: Submit 3-inch by 12-inch samples of actual finished material for review of color, pattern, and texture of exposed finishes. Compliance with other requirements is the exclusive responsibility of the Contractor.

G. Operation and Maintenance Manuals:

1. In addition to the requirements stated elsewhere in the Contract Documents, include the following as minimums:

a. Printed Instructions explaining all operating features.

b. Complete installation, maintenance, adjustment, removal, and testing instructions and procedures for all elevator equipment and components. All instructions shall be at the adjuster's level and specific to the equipment installed:

1) Include inspection and maintenance standards including wear limits, settings and tolerances.

c. Wiring Diagrams: Include a complete set within each Operation and Maintenance Manual, as well as three individually printed and bound complete sets, of as-installed straight-line wiring diagrams showing the electrical connections of all equipment and all modifications to control circuits, including wiring of safety devices. Furnish a legend sheet with each set of drawings to provide the following information:

1) Name and symbol of each relay, switch, or other apparatus.

2) Location on drawings, drawing sheet number and area, and location of all contacts.

3) Location of apparatus, whether on controller or on car.

4) Sequence of operation of apparatus connected with each elevator.

d. Complete software documentation for all installed equipment, including software updates and or revisions during the progress of the work.

e. Lubricating instructions and schedule, including recommended grade of lubricants.

f. Hoistway cleaning procedures required to meet sign off requirements of L&I.

g. List of Special Tools required for inspection, adjustment, maintenance, repair and testing. Provide special tools to Sound Transit. Special tools shall be the property of Sound Transit and kept in the elevator machine room at all times when not in use.

h. List of recommended spare parts and stock quantities for routine maintenance of the equipment. Include a list of spare parts considered critical and for which long lead time frames (items no available within 48 hours) for acquisition would result in extended equipment down-time.

i. Parts Catalog: Complete parts catalogs listing all replaceable parts including Manufacturer's identifying numbers, current unit price and ordering instructions. Include the complete parts catalog in each Operation and Maintenance Manual, as well as three separate complete printed sets.

j. The Operation and Maintenance Manual shall contain only information related to the equipment installed. Generic information not relevant to the installed equipment shall not be included.

H. Special Tools

1. Provide a complete set of special tools and instruments necessary for troubleshooting and making all adjustments on every part of the elevator installation. Any tools that are designed specifically for tasks associated with elevator inspection, maintenance and repair or that are required for these tasks, are special tools.

2. Diagnostic equipment: Provide all diagnostic test devices complete with instructions, access codes, adjusters' manuals and set-up manuals for adjustment, diagnosis and troubleshooting of elevator system, and performance of routine safety tests.

3. Storage cabinet: Provide and install a lockable metal cabinet in each elevator machine room of suitable size for the storage of special tools and necessary spare parts. Cabinet shall be mounted on legs or a pedestal a minimum of 4 inches off the floor. Cabinet to be keyed to Sound Transit standard keying system.

I. Four sets of neatly tagged keys for all switches and control features properly tagged and marked.

1.03 QUALITY ASSURANCE

A. Comply with most stringent applicable provisions of following Code and/or Authority, including revisions and changes in effect on date of these Specifications:

1. Safety Code for Elevators and Escalators, ASME A17.1

2. Inspectors' Manual, ASME A17.2.1.

3. Elevator and Escalator Electrical Equipment, ASME A17.5.

4. National Electrical Code, NFPA 70.

5. Americans with Disabilities Act (ADA).

6. Local fire jurisdiction.

7. Requirements of SBC with local municipality amendments and all other Codes, Ordinances and Laws within the governing jurisdiction.

8. Life Safety Code, NFPA 101.

9. Washington Administrative Code (WAC).

1.04 DELIVERY, STORAGE, AND HANDLING

A. Deliver material in Manufacturer's original, unopened protective packaging.

B. Store material in original protective packaging. Prevent soiling, physical damage, or moisture damage.

C. Protect equipment and exposed finishes from damage and stains during transportation, erection, and construction.

1.05 WARRANTY MAINTENANCE

A. Pre-revenue Warranty Maintenance:

1. Provide full-service Warranty Maintenance as described in this section. This period shall commence upon installation and extend to the start of Revenue Service:

a. Full-service maintenance shall include standard monthly maintenance, replacement parts, and annual testing.

2. Document completed monthly maintenance during warranty within the installer-provided Maintenance Control Program (MCP) that is kept at all times within the elevator machine room.

3. Provide preventive maintenance, as recommended by the manufacturer and in accordance with all applicable codes, during normal working hours. Systematically examine, adjust, clean, and lubricate equipment, parts, components, and subsystems. Repair or replace defective parts using parts produced by the manufacturer of installed equipment. Maintain elevator machine room, hoistway, and pit in clean condition.

4. Defective is defined to include, but not to be limited to; operation or control system failures, performance below required minimum, excessive wear, unusual deterioration or aging of materials or finishes, unsafe conditions, the need for excessive maintenance, abnormal noise or vibration, and similar unsatisfactory conditions.

5. Exercise each elevator during monthly maintenance visits and document in the MCP. Exercising of equipment shall consist of continuous operation through entire run of hoistway for one hour.

6. All warranty and maintenance work shall be performed by a company that has a current code compliant Maintenance Control Program (MCP) on file with L & I. Warranty maintenance shall meet the MCP criteria as outlined in ASME A17.1 as well as all manufacturer's recommended maintenance.

7. Equipment Manufacturer is responsible for upgrades and revisions of software and documentation of associated revision to the Operations and Maintenance Manual.

8. The Contractor shall document all maintenance and transmit maintenance records to Sound Transit.

B. Extended Warranty Maintenance:

1. Provide Extended Warranty Maintenance for a five-year period commencing at the start of Revenue Service, per Appendix A “Extended Maintenance Services Scope of Work” and as generally described below.

2. Provide full-service preventive maintenance as recommended by the manufacturer and in accordance with all applicable codes, and 24-hour emergency callback service. Systematically examine, adjust, clean, and lubricate equipment, parts, components, and subsystems. Repair or replace parts as necessary using parts produced by the manufacturer of installed equipment. Maintain elevator machine room, hoistway, and pit in clean condition.

3. 24-hour emergency callback service shall comply with the following response times:

   a. Service requests placed between 6:00am and 6:00pm: 1 hour.

   b. Service requests other hours, weekends, and holidays: 2 hours.

4. Removal of units from beneficial usage for maintenance purposes shall be coordinated with and approved by Sound Transit, unless removal is necessitated for emergency repair or adjustment. Normal preventive maintenance service shall be performed during off-peak operating hours.

5. All units shall be available for use an average of 98.7 percent of property hours of operation over each three-month period during Extended Warranty Maintenance service. This includes allowance for equipment out of service time as the result of callbacks, scheduled preventive maintenance, and repairs. Contractor’s failure to meet this unit availability provision for two consecutive three-month periods for any single elevator or escalator, or group of units, shall trigger an automatic maintenance audit by Sound Transit. Contractor agrees to expeditiously take corrective action in regard to identified deficiencies. Further, Contractor acknowledges Sound Transit’s right to pass cost of said audit to Contractor.

6. All warranty and maintenance work shall be performed by a company that has a current code compliant Maintenance Control Program (MCP) on file with L & I.

7. Equipment Manufacturer is responsible for upgrades and revisions of software and documentation of associated revision to the Operations and Maintenance Manual.

1.06 PERMIT, TEST AND INSPECTION

A. Obtain and pay for permit, license, and inspection fee necessary to complete the installation. Installation will be considered complete when the governing authority of Washington State Department of Labor and Industries has issued a permanent operating permit for each elevator.

B. Perform tests required by the elevator Section of the Washington State Department of Labor and Industries. Perform tests in accordance with procedures described in ASME A17.2.1 inspector’s manual for Electric Elevators and as required by the authorities having jurisdiction in the presence of the Resident Engineer.

C. Contractor is not relieved from furnishing and installing work shown or specified which may be beyond requirements of ordinances, laws, regulations or codes.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Approved Manufacturers:

1. Installers: KONE, Otis, Schindler, TK Elevator or Mid-American or approved equal- must be reviewed and approved by Sound Transit and meet APTA grade requirements.

2. Gearless Machines: Manufacturers standard- KONE, Otis, Schindler, TK Elevator or Mid-American or approved equal- must be reviewed and approved by Sound Transit and meet APTA grade requirements.

3. Control Manufacturers: KONE, Otis, Schindler, TK Elevator or Mid-American or approved equal- must be reviewed and approved by Sound Transit and meet APTA grade requirements.

4. Car Enclosure: KONE, Otis, Schindler, TK Elevator or Mid-American or approved equal- must be reviewed and approved by Sound Transit and meet APTA grade requirements.

5. Hoistway Entrance: KONE, Otis, Schindler, TK Elevator or Mid-American or approved equal- must be reviewed and approved by Sound Transit and meet APTA grade requirements.

2.02 MATERIALS

A. Steel:

1. Sheet Steel (Furniture Steel for Exposed Work): Stretcher-leveled, cold-rolled, commercial quality carbon steel, complying with ASTM A1008, matte finish.

2. Sheet Steel (for Unexposed Work): Hot-rolled, commercial quality carbon steel, pickled and oiled, complying with ASTM A568 and A1011.

3. Structural Steel Shapes and Plates: ASTM A36.

B. Stainless Steel: Type 316 complying with ASTM A167, with standard tempers and hardness required for fabrication, strength and durability. Apply mechanical finish on fabricated work in the locations shown or specified (Federal Standard and NAAMM nomenclature) with texture and reflectivity required to match Resident Engineer’s sample. Protect with adhesive-paper covering:

1. Non-directional orbital uniform finish: 80 grit orbital sanding over standard mill plate or shape to produce a uniform non-directional satin finish with 90 percent of mill marks removed to match Resident Engineers visual sample.

C. Aluminum: Extrusions conforming to ASTM B221. Sheet and plate conforming to ASTM B209.

D. Nickel Silver: Extrusions conforming to ASTM B151/151M.

E. Paint: Clean exposed metal of oil, grease, scale, and other foreign matter and factory paint one shop coat of Manufacturer’s standard rust-resistant primer. After erection, provide one finish coat of industrial enamel paint. Galvanized metal need not be painted. See Section 09 96 00 - High Performance Coatings.

F. Prime Finish: Clean all surfaces receiving a baked enamel paint finish of oil, grease, and scale. Apply one coat of rust-resistant mineral paint followed by a filler coat over uneven surfaces. Sand smooth and apply final coat of mineral paint.

G. Baked Enamel Finish: Prime finish in accordance with Article 2.02E above. Apply and bake two additional coats of enamel in the selected solid color.

H. Glass: Laminated safety glass, minimum 9/16 inch thick, conforming to ANSI Z97.1 and CPSC 16 CFR Part 1201 and Contract Specifications Section 08 80 00 - Glazing, Article 2.01.

2.03 EQUIPMENT

A. Equipment shall be the same for all contracts except where specifically noted. Where variations occur, each contract shall be specified separately.

B. Elevator Features:

1. Number:

   a. As specified and as detailed on the Issued for Construction Drawings.

2. Capacity and Loading Classification:

   a. As specified and as detailed on the Issued for Construction Drawings.

3. Speed:

   a. Rises greater than 50 feet: 350 feet per minute (fpm).

   b. Rises 50 feet or less: 200 feet per minute (fpm).

4. Roping: Manufacturer’s standard roping configuration per Issued for Construction Drawings.

5. Supervisory Control: Selective collective, microprocessor-based system, non-proprietary.

6. Motor Control: Variable voltage variable frequency (VVVF), microprocessor based with digital closed loop feedback and automatic stopping.

7. Power Characteristics: 480 volts, 3 phase, 60 hertz.

8. Stops and Openings: As detailed on the Issued for Construction Drawings.

9. Floors Served: As detailed on the Issued for Construction Drawings.

10. Travel: As detailed on the Issued for Construction Drawings.

11. Minimum Clear Inside Car:

    a. Geometry Type A: 5 feet 8 inches wide by 7 feet 10 inches deep.

    b. Geometry Type B: 7 feet 8 inches wide by 5 feet 3 inches deep.

12. Entrance Size: 4 feet 0 inches wide by 7 feet 0 inches high.

13. Entrance Type: As detailed on the Issued for Construction Drawings.

14. Door Operation: High speed, heavy duty, door operator, minimum opening speed 2.5 feet per second (fps).

15. Door Protection: Infrared, full screen device, with differential timing and nudging and interrupted beam time.

16. Machine: Gearless.

17. Machine Location: As specified and detailed in Issued for Construction Drawings.

18. Safety: Flexible guide clamp - Type B, car only.

19. Guide Rails: Planed steel tees.

20. Buffers: Oil for speeds above 200 fpm, springs or equivalent for speeds that do not exceed 200 fpm.

21. Car Enclosure: As specified and as detailed on the Issued for Construction Drawings. Car ceiling height of 8 feet.

22. Signal Fixtures: Vandal resistant assembly.

23. Registration Lights: Single hall pushbutton riser at each opening. Vandal resistant car and hall pushbuttons:

    a. Hall buttons and control devices shall be NEMA 4.

24. Car Position Indicator: Dual digital with direction arrows.

25. Firefighters’ elevator control panel located in Fire Command Center and remote wiring for tunnel stations or where required by local AHJ.

26. Hall Lanterns: At all floors with volume adjustable electronic chime or tone. Sound twice for down direction. Vandal resistant:

    a. Hall lanterns shall be in NEMA 4 enclosures at all locations.

27. Hoistway wiring, conduit and enclosures shall be rated for wet locations.

28. Additional Features:

    a. Roller guides.

    b. Car top inspection station.

    c. Guardrails at car top to meet code requirements for safety.

    d. Firefighters' service, including alternate floor return feature.

    e. Standby power transfer (automatic to main floor) with manual override in fire control panel.

    f. Battery return device if emergency power is not provided per construction documents.

    g. Accessibility and emergency medical services access and signage.

    h. Hinged car return panels arranged for integral car operating panels.

    i. Hoistway access switches.

    j. Hoistway door unlocking device all floors with keyed escutcheon plugs.

    k. Independent service feature.

l. Platform isolation.

m. Load weighing device.

n. Anti-nuisance feature.

o. Tamper resistant fasteners for signal fixture faceplates.

p. Sill support angles.

q. Machine, power conversion unit, and controller sound isolation.

r. Seismic devices in accordance with ASME A17.1, Section 2400.

s. Pad hooks and vinyl-covered pads.

t. Battery pack emergency car lighting. Provide separate constant pressure test button in car service compartment. Illuminate portion of normal car lighting.

u. Signage engraving filled with black paint or approved etching process.

v. Etched stainless steel support signs, interior cab only.

    1) Material: Stainless steel, etched copy and icon. Attached to interior elevator walls with VHB and silicone.

    2) Thickness: 1/8 inch thick with eased edges.

    3) Size: 3-inch x 1-1/4-inch.

    4) Braille message: Stainless steel braille beads applied below 1/32-inch raised copy and Grade II braille.

    5) Color: Reverse etched stainless steel, negative space is painted black.

w. No visible company name or logo on any equipment viewable by passengers.

x. Auxiliary car operating panel for dual entry elevators.

y. Wiring diagrams, operating instructions, and parts ordering information.

z. System Diagnostic Equipment and instructions: The elevator installation shall be a design that can be maintainable by any licensed elevator maintenance company employing journeymen mechanics, without the need to purchase or lease additional diagnostic devices, special tools, or instructions from the original equipment manufacturer:

    1) Provide onsite capability to diagnose faults to the level of individual circuit boards and individual discreet components for the solid-state elevator controller.

    2) If the equipment for fault diagnosis is not completely self-contained within the controllers but requires a separate, detachable device, that device shall be furnished to Sound Transit as part of this installation. Such device shall be in possession of and become property of Sound Transit:

a) Installed equipment not meeting this requirement shall be removed and replaced with conforming equipment at no cost to Sound Transit.

aa. Non-proprietary control system and diagnostics provisions.

bb. L&I Elevator Access Box: High Security Fire Key Box by Quality Elevator Products, Inc. Model SKB-2011 or approved equal. Color: Stainless steel #4 finish cover. Custom Label: “ELEVATOR”. Provide Department of Labor & Industries elevator key cylinder. Locate box as shown on drawings. Refer to Architectural drawings for location.

cc. Firefighters' Key Box: Knox-Box Elevator Key Box 1400 Series recessed mount and recessed mounting kit or approved equal. Color: Red. Engrave instructions for use on cover in accordance with Local Fire Authority requirements. Locate box as shown on drawings. Refer to Architectural drawings for location.

dd. Keys for elevator access and car operating panel in the machine room.

C. Car, General:

1. Car Speed: Plus or minus 3 percent of Contract speed under all loading conditions.

2. Car Capacity: Safely lower, stop and hold 125 percent of rated load.

3. Car Stopping Zone: Plus or minus 1/4 inch under all loading conditions.

4. Door Opening Time:

a. Two speed, side opening: 2.7 seconds from start of opening to fully open.

b. Single speed center opening: 1.8 seconds from start of opening to fully open.

5. Door Closing Time:

a. Two speed side opening: 4.5 seconds from start of closing to fully closed.

b. Single speed center opening: 2.8 seconds form start of closing to fully closed.

6. Car Ride Quality:

a. Horizontal acceleration within car during all riding and door operating conditions. Not more than 20 mg peak to peak in the 1-10 Hertz range.

b. Acceleration and Deceleration: Smooth constant and not more than 5 feet/second/second with an initial ramp between 0.5 and 0.75 second.

c. Sustained Jerk: Not more than 8 feet/second/second/second.

7. Airborne Noise: Measured noise level of elevator equipment during operation shall not exceed 50 decibels (dBA) in elevator lobbies. Noise Level in cab shall not exceed 55 dBA for continuous noise or 60 dBA for intermittent noise.

a. Take all dBA readings 5 feet off the floor and 1 foot or more from wall.

D. Car Equipment:

1. Frame: Welded or bolted, rolled or formed steel channel construction to meet load classification requirements.

2. Safety Device: Type B, flexible guide clamp.

3. Platform: Stainless steel frame with ¼ inch stainless steel deck. Design and construct to accommodate load classification requirements. Wood construction not permitted.

4. Guide Shoes: Roller type with three or more spring-dampened, sound-deadening rollers per shoe. Minimum roller diameter 6 inches.

5. Finish Floor Covering: Resin Epoxy flooring: seamless, flexible, resilient flooring system with high solids with colored rubber chips in a troweled mortar system. 1/4-inch thickness. “SofTop” Decorative Flooring by Sherwin Williams or approved equal, with “Shark-Grip” Slip Resistant additive. Color as selected by Resident Engineer from manufacturer’s standard.

6. Sills: Extruded stainless steel without extruded extension between car entrance columns to face of car front return. Cast-in-place concrete between sill and tactile warning surface.

7. Toe Guard: Minimum 14-gauge stainless steel reinforced and braced to car platform, with flat black finish.

8. Doors: Provide as specified for hoistway entrance doors.

9. Finger Guard: Brush type to prevent entrapment during door opening. Provide complete with cover plate to conceal fixings and coordinate with surrounding finishes.

10. Door Hangers: Two-point hanger roller with neoprene roller surface and suspension with eccentric upthrust roller adjustment.

11. Door Track: Bar or formed, cold-drawn removable steel track with smooth roller contact surface.

12. Door Header: Construct of minimum 12-gauge steel, shape to provide stiffening flanges.

13. Door Electrical Contact: Prohibit car operation unless car door is closed within tolerance allowed by Code.

14. Door Clutch: Heavy-duty clutch, linkage arms, drive blocks, and pickup rollers or cams to provide positive, smooth, quiet door operation. Design clutch so car doors can be closed while hoistway doors remain open.

15. Restricted Opening Device: Restrict opening of car doors outside the unlocking zone.

16. Door Operator: High speed, heavy-duty master door operator capable of opening doors at no less than 2.5 fps. Accomplish reversal in no more than 2 and 1/2 inches of door movement. Open doors automatically when car arrives at a floor. Provide solid state door control with closed loop circuitry to constantly monitor and automatically adjust door operation based upon velocity, position, and motor current. Maintain consistent, quiet, and smooth door operation at all floors regardless of door weight or varying air pressure up to 0.5-inch W.C. Basis of Design: GAL MOVFR or approved equal.

17. Door Control Device:

a. 3D Infrared Reopening Device: Must meet ASME A.17.1-2019

b. Black, fully enclosed device with full screen infrared matrix or multiple beams extending vertically along leading edge of each door panel to minimum height of 7 feet – 0 inches above finished floor. Device shall prevent doors from closing and reverse doors at normal opening speed if beams are obstructed while doors are closing, except during nudging operation. In event of device failure, provide for automatic shutdown of car at floor level with doors open.

c. Nudging Operation: After beams of door control device are obstructed for a predetermined time interval (minimum 20.0 to 25.0 seconds), warning signal shall sound and doors shall attempt to close with a maximum of 2.5 foot-pounds kinetic energy. Activation of the door open button shall override the nudging operation and re-open the doors.

d. Interrupted Beam Time: When beams are interrupted during initial door opening, hold door open a minimum of 3.0 seconds. When beams are interrupted after the initial 3.0-second hold open time, reduce time doors remain open to an adjustable time of approximately 1.0 to 1.5 seconds after beams are reestablished.

e. Differential Door Time: Provide separately adjustable timers to vary time that doors remain open after stopping in response to calls.

1) Car Call: Hold open time adjustable between 3.0 and 5.0 seconds.

2) Hall Call: Hold open time adjustable between 5.0 and 8.0 seconds. Use extended hall call time when car responds to coincidental calls.

18. Car Operating Panel:

a. One car operating panel without faceplate consisting of a stainless-steel box containing the operating vandal resistant fixtures, mounted behind the car enclosure swing return panel(s):

1) Panel shall be located as detailed in the Issued for Construction Drawings and as required by entrance type.

b. Suitably identify vandal resistant assemblies including floor buttons, alarm button, door open button, door close button, and emergency stop switch with SCS, Visionmark or Entrada Cast tactile symbols rear mounted. Provide plates in accordance with Local Accessibility Standards including Braille. Locate operating controls no higher than 48 inches above the car floor; no lower than 35 inches for stop device and alarm button.

c. Provide minimum 3/4-inch diameter raised 1/8 inch with square shoulders or flush floor pushbuttons, which illuminate to indicate call registration. Include 5/8-inch-high designation of the floors served directly to the left of the pushbutton. Provide keyswitches to activate floor pushbuttons at intermediate levels. Platform and surface levels to have pushbutton only:

1) Elevator car call buttons shall indicate floor levels consistent with Sound Transit's standard floor identification as follows:

a) P = Platform Level.

b) M = Mezzanine Level (1, 2, 3, etc.).

c) B = Basement Level (1, 2, 3, etc.).

d) S = Surface Level.

d. Provide alarm button at bottom of car operating panel to ring bell located on car, and sound distress signal at control panel. Illuminate button when activated.

e. Provide keyed stop switch with markings to show run and stop located in locked car service compartment.

f. Provide door open button to stop and reopen closing doors or hold doors in open position. Button operable only while car is stopped at floor regardless of special operational features, except firefighters' service.

g. Provide door close button to activate door close cycle. Cycle shall not begin until normal door dwell time for a car call has expired except firefighters' service.

h. Provide locked Firefighters' Emergency Operation Panel:

1) Openable by the same key which operates the Fire Operation switch.

2) Including the following features:

a) Phase II fire access switch.

b) Firefighters' visual indication.

c) Call cancel button.

d) Stop switch, manually operated.

e) Door open button.

f) Door close button.

g) Floors served.

i. Provide seismic indicator jewel.

j. Provide lockable service compartment with recessed flush door. Door material and finish shall match car return panel or car operating panel faceplate. Door shall contain an integral flush window for displaying the elevator-operating certificate. Inside surface of door shall accommodate mounting provisions for certificate:

1) Include the following controls in lockable service cabinet with function and operating positions identified by engraved letters painted black:

a) Inspection switch.

b) Light switch.

c) 2-speed exhaust blower switch.

d) Independent service switch.

e) Constant pressure test button for battery pack emergency lighting.

f) 120-volt, AC, GFCI protected electrical convenience outlet.

g) Card reader override switch.

h) Stop switch.

k. Provide black paint filled, engraved or approved etched signage with size and style approved by the Resident Engineer as follows:

1) Car number on main car operating panel.

2) “No Smoking” on main car operating panel.

3) Car capacity in pounds on service compartment door.

4) Phase II firefighters’ operating instructions on inside face of firefighters’ compartment door.

5) Engrave filled red “Firefighters’ Operation” on outside face of compartment door.

19. Car Top Control Station: In accordance with Code. Control station shall be provided with GFCI protected outlet and work light; include on/off switch and lamp guard. An additional GFCI receptacle shall be mounted at bottom of car. Mount to provide utilization while standing in an upright position.

E. Car Enclosure:

1. Provide complete car enclosure as specified herein and detailed on the Issued for Construction Drawings. Provide the following features:

a. Shell: Reinforced 14-gauge furniture steel. Apply sound-deadening mastic to exterior.

b. Canopy: Reinforced 14-gauge furniture steel with lockable, hinged emergency exit. Interior finish white reflective baked enamel.

c. Front and Rear Return Panels and Integral Entrance Columns: Reinforced 14-gauge non-directional finish stainless steel. Swing entire unit on substantial pivot points (minimum three) for service access to car operating panel(s). Locate pivot points to provide full swing of front return panel without interference with sidewall finish or handrail. Secure in closed position with concealed three-point latching. Provide service compartment with recessed flush cover and cutouts for operating switches.

d. Transom: Reinforced 14-gauge non-directional finish stainless steel full width of enclosure.

e. Car Door Panels: Minimum reinforced 16-gauge non-directional stainless steel. Same construction as hoistway door panels.

f. Base: Non-directional stainless steel with concealed ventilation cutouts. Cutouts to be protected from penetration by debris or liquids.

g. Interior Wall Finish: Non-directional finish stainless steel on aluminum honeycomb panels. As specified and as indicated. Refer to architectural drawings for details of elevator cab interiors including metal and glass panel installations.

h. Ventilation: Two-speed exhaust blower mounted to car canopy on isolated rubber grommets. Man-D-Tec MVS-AA, Model AA with diffuser and grille, or approved equal.

i. Lighting: Provide minimum average 15 foot-candle illumination at car floor utilizing high output LED fixtures. Provide battery standby power for operation. Provide fixtures with wiring and hookup. Coordinate with emergency lighting requirements. Provide emergency lighting integral with portion of normal car lighting system. Include required transformer:

1) All fixtures shall be above the ceiling and not allow removal without special tools. Fixture replacement shall be able to be performed from within the elevator cab by non-elevator maintenance personnel.

j. Suspended Ceiling: Special design as shown in the Issued for Construction Drawings.

k. Handrails: 1-1/2-inch diameter stainless steel tubes.

F. Operation:

1. Simplex Automatic for single elevators, Selective Collective for elevators located in groups:

a. Approved microprocessor-based car and motion control systems as follows including, as a minimum, the features described hereafter:

1) KONE KCM.

2) MCE Motion 4000.

3) Schindler Miconic.

4) Otis Elevonic.

5) Thyssenkrupp TAC 32T.

6) Smartrise.

7) Elevator Controls Corp. Pixel.

b. Register service calls on cars from pushbuttons located at each floor and in each car. Slow down, and automatically stop cars at landings corresponding to registered calls. Make stops at successive floors for each direction of travel irrespective of order in which calls are registered.

c. Use easily re-programmable system software.

d. Required Features:

1) Position Sensing: Reset car position when passing or stopping at each landing.

2) Hall Pushbutton Failure: Multiple power sources and separate fusing for pushbutton risers.

3) Duplicate communication link; all individual car computers.

2. Other Items:

a. Load Weighing: Provide means for weighing car passenger load. Design control system to provide dispatching at main floor in advance of normal intervals when car fills to capacity. Provide hall call by-pass when the car is filled to preset percentage of rated capacity and traveling in down direction. (Field adjustment range: 10 percent to 100 percent.)

b. Anti-Nuisance Feature: If car loading relative to weight is not commensurate with registered car calls, cancel car calls. Systems employing either load weighing or door protective device for activation of this feature are acceptable.

c. Independent Service: Provide controls for operation of each car from its pushbuttons only. Close doors by constant pressure on desired destination floor button or door close button. Open doors automatically upon arrival at selected floor.

d. Elevator Remote Disable: During non-revenue hours, public access to and use of the elevators shall be restricted. Control systems shall permit the Link Control Center (LCC) to shut down elevator usage during non-revenue hours and enable operation during revenue hours.

e. Car-to-Street or Lobby Feature: Provide the means for automatic return to the Street or Lobby level. Return car nonstop after answering pre-registered car calls, and park with doors open until the car is returned to normal operation.

f. Firefighters' Service: Provide equipment and operation in accordance with Code requirements.

g. Automatic Car Stopping Zone: Stop car within 1/4 inch above or below the landing sill. Avoid over-travel or under-travel, and maintain stopping accuracy regardless of load in car, direction of travel, distance between landings, and rope slippage or stretch.

h. Motion Control: Microprocessor based AC variable-voltage, variable frequency with digitally encoded closed-loop velocity feedback suitable for operation specified and capable of providing smooth, comfortable car acceleration, retardation, and dynamic braking. Limit the difference in car speed between full load and no load to not more than plus or minus 3 percent of the Contract speed.

i. Door Operation: Automatically open doors when car arrives at main floor whether car call has been registered or not.

j. Standby Lighting and Alarm: Car mounted battery unit with solid-state charger to operate alarm bell and car emergency lighting. The Battery shall be rechargeable with a minimum five-year life expectancy. Coordinate the location of light fixture with the Resident Engineer. Provide constant-pressure test button in service compartment of car operating panel.

k. Automatic Light and Fan Shut Down: The control system shall evaluate the system activity and automatically turn off the cab lighting and ventilation fan during periods of inactivity. The settings shall be field programmable.

l. Standby Power Transfer: Upon loss of normal power, adequate standby power shall be supplied via the normal electrical feeders to simultaneously start and run all single cars at rated car speed and load:

1) Automatically return cars nonstop to designated floor, open doors for approximately 3.0 seconds, close doors, and park out-of-service. During return operation, car and hall call pushbuttons shall be rendered inoperative. When all cars have returned to the designated floor, all cars shall be designated for automatic operation.

2) Provide separate key-operated selector switch in the firefighters' control panel.

3) Switch labeled STANDBY POWER OVERRIDE with positions marked AUTO and appropriate car numbers. Key shall be same as that used for firefighters' Phase I and II switch, key removable in AUTO position only.

4) Switch shall override automatic return and automatic selection functions and shall cause the manually selected car to operate. Manual selection shall cause car to start and proceed to designated floor and open and close its doors before stand-by power is transferred to the next selected car.

5) Provide STANDBY POWER indicator lights (one per car) in firefighters' control panel. Indicator light illuminates only when corresponding car is selected to automatically or manually operate on standby power.

m. Seismic Operations and Equipment:

1) Provide design, components and operation in accordance with governing code. Provide dual counterweight derailment sensing wires vertically each side of counterweight the entire height of travel. The counterweight frame shall be equipped with four derailment rings. A dual axis seismic switch shall be provided that will activate at no less than 0.15 times gravity in the vertical or horizontal directions. A minimum of one seismic switch shall be provided per single or group of elevators. Counterweight retainer plates shall be bolted; welded plates are not acceptable.

n. Sump High Water Sensor:

1) Provide sump with water sensor tied to a remote alarm and the Building Management System (except for ST Garages as there is no BMS connection at garages) to notify LCC if water has exceeded capacity of sump.

o. Ascending Car Overspeed Protective Device:

1) Provide a device designed to prevent an ascending elevator from striking the hoistway overhead structure. The device shall

decelerate the car with any load up to the rated capacity by applying an emergency brake:

a) The device shall detect an ascending car overspeed condition of not greater than 10 percent higher than the speed that the car governor is set to trip.

b) The device, when activated, shall prevent operation of the car until the device is manually set.

c) The device shall meet the requirements of current code for safety per the WAC.

p. Unintended Car Movement Protective Device:

1) Provide a device to prevent unintended car movement away from the landing when the hoistway doors are not in the closed and locked position and the car doors are not in the closed position:

a) The device shall prevent such movement in the event of failure of the electric driving machine motor, brake, coupling, shaft or gearing, control system, and any other component upon which the speed of the car depends, except the suspension ropes and the drive sheave of the traction machine.

b) The device, when activated, shall prevent operation of the car until the device is manually reset.

c) The device shall meet the requirements of current code for safety per the WAC.

G. Elevator Machine Equipment:

1. Arrange equipment in spaces shown on Issued for Construction Drawings.

2. Gearless Traction Hoist Machine:

a. Traction, gearless type with AC induction or P.M.S.M. ACV^{3}F motor, primary and emergency brakes, drive shaft, and deflector sheave, mounted in proper alignment on an isolated bedplate. Provide bedplate blocking, secondary or deflector sheave frames and overhead beams/sheaves as required by hoist machine location. Provide all standard equipment. Provide the following optional equipment:

1) Brake switch.

2) Sheave guard.

3) Machine bedplate.

4) Foundation bolts and pipe spacers.

5) Manual brake release.

6) VVVF-AC Hoist Motor.

3. Solid State Power Conversion and Regulation Unit:

a. Design unit to limit current, suppress noise, and prevent transient voltage feedback into building power supply. Provide internal heat sink cooling fans for the power drive portion of the converter panels. Conform to recommended practice for Emergency and Standby Power Systems for Industrial and Commercial Applications for line harmonics and switching noise.

b. Isolate unit to minimize noise and vibration transmission. Provide isolation transformers, filter networks, and choke inductors.

c. Suppress solid-state converter noises, radio frequency interference, and eliminate regenerative voltage transients induced into the mainline feeders or the building standby power generator.

d. Supplement direct-current power for the operation of hoist machine brake, door operator, dispatch processor, and signal fixtures from separate static power supply.

4. Encoder: Direct drive, solid-state, optical, digital type. Update car position at each floor and automatically restore after power loss.

5. Controller: UL/CSA labeled:

a. Compartment: Securely mount all assemblies, power supplies, chassis switches, and relays, on a substantial, self-supporting steel frame. Completely enclose equipment with covers.

b. Relay Design: Magnet operated with contacts of design and material to ensure maximum conductivity, long life and reliable operation without overheating or excessive wear. Provide wiping action and means to prevent sticking due to fusion. Contacts carrying high inductive currents shall be provided with arc deflectors or suppressors.

c. Use of SIL (Safety Integrity Level) rated devices for EPD (Electrical Protective Devices) where possible is preferred to traditional positively opened mechanical switches. These devices shall be listed/certified and labeled/marked to a SIL rating in accordance with the applicable requirements of IEC 61508-2 and IEC 61508-3 with a SIL rating equal to or greater than the SIL indicated for the applicable device shown in ASME A17.1.

d. The detection of a dangerous fault (e.g. with diagnostic tests, proof-tests, or by any other means) in SIL rated electrical/electronic/programmable electronic system (E/E/PES, or commonly referred to as "PES") that can tolerate a single fault shall cause the elevator to revert to a known fail-safe condition. Where necessary, to maintain the integrity of the SIL rated PES and maintain the fail-safe condition prior to a second fault that could lead to a dangerous condition, a manual reset shall be required to remove the SIL rated PES from the fail-safe condition.

e. Microprocessor-Related Hardware:

1) Provide built-in noise suppression devices, which provide a high level of noise immunity on all solid-state hardware and devices.

2) Provide power supplies with noise suppression devices.

3) Isolate inputs from external devices (such as pushbuttons) with isolation modules.

4) Design control circuits so that one side of power supply is grounded.

5) Safety circuits shall not be affected by accidental grounding of any part of the system.

6) System shall automatically restart when power is restored.

7) System memory shall be retained in the event of power failure or disturbance.

8) Equipment shall operate properly with a 500 Kilohertz to 1300-Megahertz radio frequency signal, transmitted at a power level of not less than 100 watts Effective Radiated Power (ERP) at a distance of 3 feet.

9) Provide equipment with Electro Magnetic Interference (EMI) shielding within FCC guidelines.

f. Wiring: CSA labeled copper for factory wiring. Neatly route all wiring interconnections and securely attach wiring connections to studs or terminals.

g. Provide controller or machine mounted auxiliary, lockable “off” disconnect if mainline disconnect not in sight of controller and hoist machine.

h. Permanently mark components (relays, fuses, and PC boards) with symbols shown on wiring diagrams.

i. Provide controller or machine mounted auxiliary, lockable off, disconnect if mainline disconnect not in sight of controller and machine.

6. Sleeves and Guards: 4-inch steel angle guards around cable or duct slots through floor slabs or grating. Provide rope and smoke guards for sheaves, cables, and cable slots in machine room and secondary levels. Provide wire mesh infill barrier between hoistway and machine room openings.

7. Machine and Equipment Support Beams: Provide structural steel beams required for direct support of elevator hoist machine, deflector sheaves, overhead sheaves, governor, and dead-end hitch assemblies:

a. Provide bearing plates, anchors, shelf angles, blocking, and embedments for support and fastening of machine beams or equipment to the building structure.

b. Isolate machine and overhead sheave beams to eliminate noise and vibration transmission to building structure.

c. Provide ladders and platforms with handrails and toeboards for overhead sheave access.

8. Governor: Hoist machine manufacturer’s standard, centrifugal-type, car and counterweight driven, with pull-through jaws and bi-directional electrical shutdown switches. Provide required auxiliary supports for attachment to building structure:

a. Governor shall be remote set/automatic reset type.

9. Vibration Isolation: All elevator equipment provided under this Contract, including power conversion unit, controller and their support, shall be mechanically isolated from the building structure and from electrically induced vibration to minimize the

possibility of objectionable noise and vibrations being transmitted to the car, building structure, or occupied areas of building.

10. Sound Isolation:

a. Noise level relating to elevator equipment and its operation shall not exceed 55 dBA for continuous noise or 80 dBA for intermittent noise in the machine room and cab.

b. Take all dBA readings 3 feet off the floor and 3 feet from the equipment in machine room.

c. Take all dBA readings 5 feet off the floor and 1 foot or more from wall in cab.

11. Connection to Remote Monitoring Interface Terminal Cabinet:

a. Provide conduit and wiring between the elevator controller and the interface terminal cabinet for remote monitoring and control of each car by the Building Management System. See Drawings for Building Management System Elevator Interface Diagram and I/O Points for Typical Equipment:

1) Receive the following dry contact inputs to effect the following control actions for each car:

a) Phase 1 Recall – Primary (from fire alarm panel).

b) Phase 1 Recall – Alternate (from fire alarm panel)

c) Access control permissive.

d) Elevator Remote Disable.

2) Provide normally open dry contacts for each of the following status items for each car:

a) Elevator Warning Alarm.

b) Passenger Alarm Pushbutton.

c) Phase 1 Fire Operation.

d) Phase 2 Fire Operation.

e) Elevator door closed.

f) Independent Service.

g) Seismic Operation.

h) Elevator at floor (one contact per floor).

i) Standby Power Operation.

b. Provide conduit and wiring between the hoistway sump, high water sensor and the interface terminal cabinet for remote monitoring by the Building Management System:

1) Provide normally open dry contact for each of the following status items for hoistway:

a) Sump High Water Alarm.

H. Hoistway Equipment:

1. Guide Rails: Minimum 15 pounds per foot or heavier, planed steel T-sections of suitable size and weight for the application, structural support spacing, car weight, counterweight, and seismic reactions, with brackets for attachment to building structure. Provide car rail backing and intermediate counterweight tie brackets to meet Code requirements.

2. Buffers, Car, and Counterweight: Oil type for speeds over 200 fpm with blocking and support channels. Provide switch on buffer to limit car speed if buffer is compressed. Provide buffer access ladder and platform.

3. Sheaves: Machined grooves with sealed bearings. Provide mounting means to machine beams, machine bedplate, and car and counterweight structural members.

4. Counterweight: Steel frame with metal filler weights, guided by 5-inch roller guide shoes.

5. Counterweight Guard: Metal guard in pit.

6. Governor Rope Pit-Tensioning Sheave: Mount sheave and frame on pit floor support frame or guide rail. Provide with guides or pivot point to enable free vertical movement and proper tension of cable/tape.

7. Hoist and Governor Ropes:

a. Hoist rope shall be 8 by 19 or 8 by 25 Seale construction, traction steel type. Fasten with staggered length, adjustable, spring isolated shackles.

b. Governor rope to suit manufacturer’s specification.

8. Terminal Stopping: Provide normal, final and emergency terminal speed limiting devices. Provide ability to bypass final limit while in inspection mode on car to properly access and maintain the overhead sheaves, beams and governor for Elevators. There will be no secondary platforms or access panels provided for service to the overhead area.

9. Copper Electrical Wiring and Wiring Connections:

a. Conductors and Connections: Copper throughout with individual wires coded and connections on identified studs or terminal blocks. Use no splices or similar connections in wiring except at terminal blocks, control compartments, junction boxes, or condulets. Provide 10 percent spare conductors throughout. Run spare wires from car connection points to individual elevator controllers in the machine room:

1) All wiring within hoistway shall be suitable for wet locations.

b. Conduit: Painted or galvanized steel conduit and duct. Conduit size, 1/2 inch minimum. Flexible conduit not to exceed 36 inches in length. Flexible heavy-duty service cord may be used between fixed car wiring and car door switches for door protective devices.

1) All raceways and wiring mounted on the top of the elevator shall be suitable for wet locations. The routing of the raceways or conduit shall be routed to preclude damage from being stepped on during maintenance. If this is not possible provide steps or other additional protection.

c. Traveling Cables: Type ET flame and moisture-resistant outer cover. Prevent traveling cable from rubbing or chafing against hoistway or equipment within hoistway. Refer to “special elevator equipment” for list for spares to be included in traveling cables.

10. Entrance Equipment:

a. Door Hangers: Two-point hanger roller with neoprene roller surface and suspension with eccentric upthrust roller adjustment.

b. Door Tracks: Bar or formed, cold-drawn removable steel tracks with smooth roller contact surface.

c. Door Interlocks: Operable without retiring cam. Paint interlocks flat black.

d. Door Closers: Spring, spirator, or jamb/strut mounted counterweight type. Design and adjust to ensure the smooth quiet mechanical close of doors.

e. Floor Numbers: Stencil paint 4-inch-high floor designations in contrasting color on inside face of hoistway doors at each landing and adjacent to the leading edge of the door.

I. Special Elevator Equipment: The elevators shall accommodate certain communication subsystem equipment which shall be provided. This equipment and its appurtenances shall be built into the elevator at the factory, unless noted otherwise:

1. CCTV Cameras: Provide and Install 2 cameras for each elevator:

a. Axis P3364 or approved equal.

b. Imaging device: 1/3-inch color CCD 3-9 mm, vari-focal, auto iris lens.

c. Ability to control and monitor video over IP network.

d. Supported protocols: TCP/IP, UDP/IP (unicast, multicast IGMP), UPnP, DNS, DHCP, RTP, NTP.

e. Supported video resolutions: 4CIF, 2CIF, CIF, QCIF.

f. Digital compression: MJPEG, MPEG-4.

g. Web user viewing interface with up to 5 additional simultaneous users.

h. Cameras to support low-light capability.

i. Camera shall be connected by CAT6 to an Ethernet PoE switch located in a Contractor supplied enclosure attached to the elevator cab.

2. CCTV Camera Enclosure: Provide and Install for each CCTV Camera:

a. Install CCTV cameras with protective housings.

b. Mini-dome with integrated camera and lens.

c. Tamper resistant hardware.

d. Rugged, high-impact, puncture-proof, opaque (smoked) dome plastic.

e. NEMA 4X and IP 66.

f. Input voltage: 18 - 30VAC, 24 VAC nominal.

g. Above ceiling dimensions: 2 inches high x 3.5 inches wide, nominal.

h. Below ceiling dimensions: 2.5 inches high x 5.5 inches wide, nominal.

i. Dome diameter: 3.75 inches, nominal.

j. Cable: RJ45-10 connector for 100Base-TX Ethernet.

2. Emergency Communication System: Complying with ASME A17.1 and the U.S. Architectural & Transportation Barriers Compliance Board's "Americans with Disabilities Act (ADA), Accessibility Guidelines (ADAAG)":

a. “Push to Call,” two-way communication instrument in car with automatic dialing, tracking, and recall features with shielded wiring to car controller in machine room. Provide dialer with automatic rollover capability with minimum two numbers:

1) “Push to Call” button or adjacent light jewel shall illuminate and flash when call is acknowledged. Button shall match car operating panel pushbutton design. Provide uppercase “PUSH TO CALL,” “HELP ON THE WAY” engraved signage adjacent to button.

2) Provide “Push to Call” button tactile symbol, engraved signage, and Braille adjacent to button mounted integral with car front return panel.

b. Communication for Deaf, Hard of Hearing and Speech Impaired: On the same car operating panel as the phone pushbutton, provide capability to communicate with and obtain responses from passengers, including those passengers who cannot communicate verbally or hear.

c. Provide display video capability for entrapment assessment.

d. Provide two-way communication between car and machine room.

e. On activation, system dials preprogrammed number of monitoring station and identifies elevator location to monitoring station.

f. System provides two-way voice communication without using a handset and provides visible signals that indicate when system has been activated and when monitoring station has responded.

g. System is contained in flush-mounted cabinet, with identification, and instructions for use.

4. PA Speakers:

a. Provide and install an 8-ohm public address speaker in the car canopy and connect via speaker cabling to Contractor provided PA terminals in the interface terminal cabinet.

b. Provide and install Atlas UKT speakers, 95-8-7 backbox, FAMT-6 adapter plate and 60-8A round satin aluminum finish grill or approved equal.

3. Radio Antenna: Provide mounting provisions for Commprod antenna in the elevator cab ceiling. Antenna to be provided by Emergency Radio Contractor. Provide cabling from the car to the interface terminal cabinet.. The antenna must be installed only if AHJ requires it:

   a. Where AHJ does not require a radio in the cab, designer must confirm there is adequate cell coverage at location of elevator. In the event that there is not adequate cell coverage, radio antenna per above must be provided.

4. For elevators requiring access to non-public floors: Provide and install Lenel 2210 door controller mounted in the NEMA 4X enclosure.

5. For elevators requiring access to non-public floors: Provide and install HID iClass R40 card reader in the elevator cab.

6. Sound Transit-provided PoE Ethernet Switch:

   a. Install ST-provided PoE Ethernet switches.

   b. One switch shall be installed in the elevator cab and the other in the Interface Terminal Cabinet.

   c. Minimum of 8 ports.

   d. At least one fiber port for switch-to-switch connection.

   e. Connect door controller and cameras to the Ethernet switch via CAT6 cable.

   f. The Ethernet switch in the elevator shall be connected to the Ethernet switch in the interface terminal cabinet via Contractor provided fiber optic cable in the travelling cable.

   g. Power for the switch shall be provided from the station’s Communications UPS power.

   h. Configuration settings from the Ethernet switch per Sound Transit IT department.

7. Elevator Cab Enclosure: provide a NEMA 4X enclosure, attached to the elevator cab, accessible from inside the cab, sized to install the door controller, Ethernet switch, and fiber distribution panel.

   a. Layout of devices shall provide easy maintenance access.

   b. Provide elevator power to all powered devices in the enclosure.

8. Communications Cabling and Wiring: Provide and install communications systems wiring within the traveling cable from car device to the elevator controller cabinet or the Interface Terminal Cabinet. Land wiring on terminal blocks or connectors specifically made for the intended use. Provide and install conduit between elevator controller and the Interface Terminal Cabinet:

   a. All cabling to be plenum rated and shall be as follows:

1) Elevator cab PoE ethernet switch to elevator machine room ethernet switch: 6-strand plastic (multi-mode), or glass (single mode) fiber optic cable. Terminate all strands of the fiber in an FDP with LC connectors on both ends. Provide patch cords from the FDP to the switches.

2) The fiber cable provided and installed shall be rated to withstand the repeated movement associated with the duty cycle of the elevator (to be noted in product data submittal) while also meeting the Sound Transit performance criteria noted below over the expected life of the traveling cables.

3) Fiber Optic Performance Criteria:

a) Effective Minimum Bitrate (R) is two times the bandwidth (Δf): $R\left[\frac{Mb}{s}\right] = 2 * \Delta f\ [MHz]$

b) Attenuation Guidelines:

Glass Fiber	
Wavelength (nm)	**Attenuation Rate (db/km)**
1550	0.25
1625	0.25
Max Loss Budget Calculation	
Max Loss Budget [dB] =	(Length[km] * Attenuation Rate) + (Connector pairs * 0.25 dB) + (Number of splices * 0.25 dB)
Plastic Fiber	
Wavelength (nm)	**Attenuation Rate (db/m)**
650	0.2
Max Loss Budget Calculation	
Max Loss Budget [dB] =	(Length[m] * Attenuation Rate) + (Connector pairs * 2.5 dB) + (Number of splices * 2.5 dB)

h. Testing Requirements:

a) Minimum Effective Bitrate of 2.5 Mb/sec.

4) Losses determined from OTDR testing within the calculated Max Loss Budget.

Example: 100-meter Elevator Traveling Cable Fiber Optic Criteria		
Fiber Material	**Effective Minimum Bitrate**	**dB Max. Loss Budget**

Plastic	2.5 Mb/sec	25.70 dB
Glass	2.5 Mb/sec	1.73 dB

5) Installing contractor shall demonstrate fiber optic performance via witnessed OTDR dB attenuation testing conducted in accordance with TIA-568-C.0 Compliant Fiber Optic Test Procedures. Fiber cable must meet the above performance upon initial testing and throughout the full life of the traveling cables.

6) Installing contractor to conduct testing for bandwidth to determine effective minimum bit rate over the fully connected traveling cable between nearest elevator machine room network connection switch and cab network switch. Regardless of traveling cable length, the Effective Minimum Bitrate of 2.5Mb/sec is required.

7) Test results shall be provided to Sound Transit under Submittals.

d. Paging speaker: One copper pair 16 AWG.

b. Radio Antenna: One super flex 75-ohm coaxial cable.

c. Wiegand cabling from the door controller to the access card reader.

d. CAT6:

1) Elevator cab: from the cameras and door controller to the PoE Ethernet switch.

2) Interface Terminal Cabinet: from the PoE Ethernet switch to RJ45 jacks on the interface terminal cabinet.

e. Instrumentation: Minimum 6 shielded twisted pairs; minimum #18-gauge instrumentation cable.

f. Provide four pairs of spare shielded communication wires in addition to those required to connect specified items. Tag spares in machine room.

2.04 COMPONENTS

A. Hoistway Entrances:

1. Complete entrances bearing UL fire labels.

2. Frames: Stainless steel at all floors. Standard bolted head to jamb connection assemblies fabricated from not less than 14-gauge material. Permanently attach rear mounted Arabic floor designation plates, centerline at 60 inches above finished floor, on both sides of jambs existing. Provide main egress landing plates with Star designation. Braille indications shall be below Arabic floor designation.

3. Door Panels: 16-gauge non-directional finish stainless steel, sandwich construction without binder angles.

a. Provide leading edge of side-opening doors with rubber astragals. Provide a minimum of three gibs per panel; one at leading edge, one at trailing edge and one at center of leaf with gibs in the sill groove entire length of travel.

b. Provide leading edge of center-opening doors with rubber astragals. Provide a minimum of three gibs per panel; one at leading edge, one at trailing edge and one at center of leaf with gibs in the sill groove entire length of travel:

1) Gibs shall be roller type, with three rollers per gib, to reduce kinetic friction effects during hoistway pressure differential events.

c. Elevators with Rated Shaft: Provide safety glass vision panel approximately 4 inches by 20 inches in one panel.

d. Elevators without Rated Shaft: Provide 9/16-inch-thick laminated tempered glass approximately 16 inches by 72 inches in each door panel.

4. Sight Guards: 14-gauge, same material and finish as hoistway entrance door panels. Construct without sharp edges.

5. Sills: Extruded nickel silver.

6. Sill Supports: Structural steel designed to support door sill based upon car loading classification protected from corrosion. Grout under the sill. Five-inch by 5-inch by 1/2-inch hot-rolled structural steel angle, extend full width of hoistway. Fasten to building structure at maximum 18 inches on center. Refer to Issued for Construction Drawings for additional details.

7. Fascia, Toe Guards, and Hanger Covers: 14-gauge furniture steel with Manufacturer's standard finish. Provide fascia, toe guards, and hanger covers for rear entrances. Provide fascia for express hoistway travel.

8. Struts and Headers: Provide for vertical support of entrances and related material.

9. Finish of Frames and Doors: Non-directional finish stainless steel.

B. Hall Control Stations:

1. Pushbuttons: Provide one riser with flush-mounted faceplates. Include pushbuttons for each direction of travel, which illuminate to indicate call registration. Include approved engraved message and pictorial representation prohibiting use of elevator during fire or other emergency situation as part of faceplate. Pushbutton design shall match car operating panel pushbuttons. Provide vandal resistant pushbutton and light assemblies. Circuit boards for hall call station switches shall be conformal coated.

2. Hoistway Door Unlocking Device: Provide unlocking device with locking escutcheon plug in door panel at all floors with finish to match adjacent surface.

3. Hoistway Access Switches: Mount in entrance frame side jamb at top and bottom floors. Provide fixture with faceplate.

4. Faceplate Material and Finish:

a. Hall Lantern: Non-directional stainless steel.

b. Car Position Indicator: Non-directional stainless steel.

c. Lobby Position Indicator: Non-directional stainless steel.

d. Hall Pushbutton Station: Non-directional stainless steel.

e. Hoistway Access Switch: Non-directional stainless steel.

C. Signals:

1. Hall Lantern: Provide at each entrance to indicate travel direction of arriving car. Locate as detailed on Issued for Construction Drawings. Illuminate up or down lights and sound tone twice for down direction travel prior to car arrival at floor. Sound level to be adjustable from 20 to 80 dBA measured at 5 feet in front of hall pushbutton and 3 feet off floor. Illuminate light until the car doors start to close. Provide advanced hall lantern notification to comply with ADA hall call notification time. Minimum 2 and 1/2 inches in the smallest dimension, arrow lenses with faceplates. Provide vandal resistant lantern and light assemblies consisting of series of dots or lines for maximum visibility.

2. Car Position Indicator: Alpha-numeric digital indicator containing floor designations and direction arrows a minimum of 1/2 inch high to indicate floor served and direction of car travel. Locate fixture in each car operating panel. When a car leaves or passes a floor, illuminate indication representing position of car in hoistway. Illuminate proper direction arrow to indicate direction of travel. Provide vandal resistant indicator and light assemblies.

3. Lobby Position Indicator: Alpha-numeric digital indicator containing floor designations and direction arrows a minimum of 1/2 inch high to indicate floor served and direction of car travel. Locate fixture integral with hall lanterns at Plaza level. When a car leaves or passes a floor, illuminate indication representing position of car in hoistway. Illuminate proper direction arrow to indicate direction of travel. Provide vandal resistant indicator and light assemblies.

4. Floor Passing Tone: Provide an audible tone of no less than 20 dBA and frequency of no higher than 1500 Hertz, to sound as the car passes or stops at a floor served.

5. Voice Synthesizer: Provide electronic device with easily re-programmable message and voice to announce car direction, floor, and emergency exiting instructions.

6. Card reader override: Provide conduit and wiring to control panel. Fixtures shall be located as directed by the Resident Engineer. Coordinate size and location.

7. Fire Fighters' Control Panel: Within tunnel stations (or otherwise required by AHJ) locate in the station's Fire Command Center Room. Furnish and install panel and all applicable wiring from each elevator to the fire panel. All supplied conductors shall conform to the requirements of NFPA 130. Associated conduit to be provided by Electrical. Fixture faceplate, No. 4 brushed finish stainless steel, including the following features:

   a. Car position and direction indicator (digital-readout or color SVGA display type). Identify position indicator with car number.

   b. Indicator showing operating status of car.

   c. Wiring to panel. Conduit from closest elevator hoistway of each group by others.

   d. Manual car standby power selection switch and power status indicator.

   e. Two position fire fighter's emergency return switches and indicators with engraved instructions filled with red epoxy paint.

8. Communication Failure: Provide phone line communication failure indicator light and reset keyswitch integral mounted within hall control station located at the primary phase 1 recall landing.

9. Seismic Operations and Equipment 0. Provide design, components, and operation in accordance with ASME A17.1, Part XXIV.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Before installing equipment, examine hoistway and machine room areas. Verify that no irregularities exist that affect execution of work specified. Hoistway and pit to be evaluated and confirmed as sealed and watertight prior to commencing installation of elevator equipment.

B. Do not proceed with installation until work in place conforms to Contract requirements.

3.02 INSTALLATION

A. Install all equipment in accordance with Manufacturer's instructions, referenced Codes, these Contract Specifications and approved submittals.

B. Install machine room equipment with clearances in accordance with referenced Codes and these Contract Specifications.

C. Install all equipment so it may be easily removed for maintenance and repair.

D. Install all equipment for ease of maintenance.

E. Install all equipment to afford maximum accessibility, safety, and continuity of operation.

F. Remove oil, grease, scale, and other foreign matter from the following equipment and apply one coat of field-applied machinery enamel.

1. All exposed equipment and metal work installed as part of this work that does not have architectural finish.

2. Machine room equipment, hoistway equipment including guide rails, guide rail brackets, and pit equipment.

3. Neatly touch up damaged factory-painted surfaces with original paint and color. Protect machine-finish surfaces against corrosion.

3.03 FIELD QUALITY CONTROL

A. Perform tests required by the elevator Section of the Washington State Department of Labor and Industries. Perform tests in accordance with procedures described in ASME A17.2.1 inspector's manual for Electric Elevators and as required by the authorities having jurisdiction in the presence of the Resident Engineer.

B. Contractor is not relieved from furnishing and installing work shown or specified which may be beyond requirements of ordinances, laws, regulations or codes.

C. Work at jobsite will be checked during course of installation. Full cooperation with reviewing personnel is mandatory. Accomplish corrective work required prior to performing further installation.

D. Have Code Authority acceptance inspection performed and complete corrective work.

3.04 ADJUSTING

A. Install rails plumb and align vertically with tolerance of 1/16 inch in 100 feet. Secure joints without gaps and file any irregularities to a smooth surface.

B. Static balance car to equalize pressure of guide shoes on guide rails.

C. Lubricate all equipment in accordance with Manufacturer's instructions.

D. Adjust motors, power conversion unit, brake, controllers, leveling switches, limit switches, stopping switches, door operators, interlocks, and safety devices to achieve required performance levels.

3.05 CLEANING

A. Keep work areas orderly and free from debris during progress of Contract. Remove packaging materials on a daily basis.

B. Remove all loose materials and filings resulting from work.

C. Clean machine room equipment and floor.

D. Clean hoistways, car, car enclosure, entrances, and operating and signal fixtures per submitted procedures as required to meet sign off requirements of L&I.

3.06 DEMONSTRATION

A. General: Furnish labor, materials, and equipment necessary for tests. Notify the Resident Engineer five days in advance when ready for final review of unit or group. Acceptance of installation will be made only after all field-quality control reviews have been completed, identified deficiencies have been corrected, all Sound Transit's information and certificates have been received, and the following items have been completed to satisfaction of Sound Transit:

1. Workmanship and equipment comply with these Contract Specifications.

2. Contract speed, capacity, floor-to-floor, and door performance comply with these Contract Specifications.

3. Performance of following are satisfactory:

a. Starting, accelerating, running.

b. Decelerating, stopping accuracy.

c. Door operation and closing force.

d. Equipment noise levels.

e. Lighting levels.

f. Signal fixture utility.

g. Overall ride quality.

h. Performance of door control devices.

i. Operations of special security operation and floor lock-off provisions.

j. Fiber optic cabling within travelling cables performs to Sound Transit Elevator Traveling Cable Fiber Optic Performance Criteria.

k. Demonstrate CCTV Camera image on computer connected to data cable to Interface Terminal Cabinet.

l. Demonstrate the PA system works by connecting to an amp and broadcasting voice over speaker.

m. Demonstrate phone installation by dialing designated ST control center.

n. Demonstrate each monitoring and control signal to Building Management System at interface Terminal Cabinet.

4. Test Results:

a. In all test conditions, obtain specified speed, performance times, stopping accuracy without re-leveling, and ride quality to satisfaction of the Resident Engineer,

b. Temperature rise in motor windings limited to 120 degrees F above ambient. A full-capacity, 1-hour running test, stopping at each floor for 10 seconds in up and down directions, may be required.

B. Performance Guarantee: Should tests reveal defects, poor workmanship, variance or noncompliance with requirements of specified Codes and/or ordinances, or variance or noncompliance with the requirements of these Specifications, complete corrective work to satisfaction of Resident Engineer at no cost:

1. Replace equipment that does not meet Code or these Specifications requirements.

2. Perform work and furnish labor, materials, and equipment necessary to meet specified operation and performance.

3. Perform and assume cost for retesting required by Governing Code, Authority, and Sound Transit to verify specified operation and/or performance.

C. Field Review Scheduling: Schedule progress and final equipment reviews with the Resident Engineer. Reply promptly, in writing, to corrective work indicated on the Resident Engineer's progress and/or final review reports, indicating status, schedule for completion, and questions.

3.07 TRAINING

A. Provide orientation and training to familiarize Sound Transit operations personnel with the features and operation of the elevator.

1. Include step-by-step instructions for elevator operations, controls and features, including procedures for locking down elevators when not in service.

2. Training shall include complete familiarization of the elevator and elevator machine room, including components installed within the machine room.

3. Provide training materials that detail step-by-step instructions of elevator operations for use in future familiarization training of personnel.

3.08 COMMISSIONING

A. Refer to specifications Section 14 08 00 - Commissioning of Conveying Equipment for further requirements pertaining to the work in this section.

END OF SECTION

SECTION 14 24 00

HYDRAULIC ELEVATORS

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for furnishing and installing and providing Maintenance for hydraulic passenger elevators as specified and detailed in the Issued for Construction Drawings.

B. Related work provided under other sections:

1. Hoistway and Pit:

a. Clear, plumb, and substantially flush hoistway with variations not to exceed 1 inch at any point.

b. Bevel cants not less than 75 degrees with the horizontal on any rear or sidewall ledges and beams that project or recess 4 inches or more into the hoistway. Not required on hoistway divider beams.

c. Supports at each floor for car and counterweight guide rail fastening. Intermediate support when heights exceed 14 feet 0 inch. Building supports not to deflect more than 1/8 inch under normal conditions and 1/4 inch under seismic conditions.

d. Installation of guide rail bracket supports in concrete. Inserts or embeds, if used, will be furnished under this Section.

e. Wall blockouts and fire rated backing for control and signal fixture boxes that penetrate walls.

f. Cutting and patching walls and floors. Finished floors slope away from elevator doors.

g. Opening in hoistway wall or pit wall for hydraulic piping. Trench and backfill underground piping.

h. Erect front hoistway wall after elevator entrances are installed.

i. Grout around hoistway entrances and sills.

j. Provide pit access ladder for each elevator.

k. Provide structural support for car buffer impact loads, guide rail loads, and cylinder loads.

l. Waterproof pit. Dry sump with flush grate. Provide pump or indirect drain to remove accumulated liquid.

m. Protect open hoistways and entrances during construction in accordance with OSHA Regulations.

n. Protect car enclosure, hoistway entrance assemblies, and special metal finishes from damage after installation.

o. Hoistway venting or pressurization to prevent accumulation of smoke and gas as required by Local Building Code.

p. Seal fireproofing to prevent flaking.

2. Machine Room:

a. Provide enclosure with access.

b. Provide self-closing and locking access door with panic door hardware.

c. Provide ventilation, air conditioning and heating as required. Maintain minimum temperature of 55 degrees F, maximum 90 degrees F. Maintain maximum 80 percent relative humidity, non-condensing.

d. Paint walls, ceiling, and floor.

e. Provide class “ABC” fire extinguisher.

f. Seal fireproofing to prevent flaking.

g. Provide fire sprinklers where required by code.

h. Only conduit, wiring, and equipment directly related to the hydraulic elevator are allowed in elevator machine rooms.

3. Electrical Service, Conductors and Devices:

a. Provide lighting and Ground Fault Circuit Interrupter (GFCI) convenience outlets in pit and machine room.

b. Provide conduit from elevator controller to fire alarm system interface in/near the elevator machine room. Coordinate size, number, and location of conduits.

c. Provide three-phase mainline copper power feeder to terminals of each elevator controller in the machine room with protected, lockable “OPEN,” disconnect with auxiliary contacts to allow electrical interlock with battery power lowering unit.

d. Provide single-phase copper power feeder to each elevator controller for car lighting and exhaust blower with individual protected, lockable “OFF,” disconnect switch located in machine room.

e. Provide single-phase copper power feeder to each elevator controller for tank heater, cylinder heat trace system and oil cooler system (min. 20 amps) with individual protected, lockable “OFF”, disconnect switch located in machine room.

f. See Section 28 31 00 - Fire Detection and Alarm for fire detection and fire recall. Provide temporary power and illumination to install, test, and adjust elevator equipment.

g. Provide means to manually and automatically disconnect power to affected elevator pump unit and controller prior to activation of machine room overhead fire sprinkler system, and/or hoistway overhead fire sprinkler system. Manual shut-off means shall be located outside bounds of machine room.

h. When sprinklers are provided in the hoistway, all electrical equipment, except seismic protective devices, located less than 4 feet above the pit floor shall be identified for use in wet locations (NFPA 70).

i. Provide power feeder to elevator intercom amplifier located in the elevator machine room.

j. Provide power feeder to each elevator controller in machine room for elevator car heating and air conditioning unit.

4. Standby Power Provision:

a. Standby power of the same voltage characteristics via normal electrical feeder to run all elevators at full-rated car speed and capacity.

b. Conductor from auxiliary form “C” dry contacts, located in the standby power transfer switch to a designated elevator control panel in each elevator group and/or single elevator unit. Provide time delay of 30-45 seconds for pre-transfer signal in both directions.

c. Standby single-phase power to group controller, and each elevator controller for lighting, exhaust blower, emergency call bell, intercom amplifier, and hoist machine cooling fan.

d. Means for absorbing regenerated power during an overhauling load condition, in accordance with NEC 650-101. Elevator shall employ SCR IBGT drive, presenting a non-linear active load.

e. Provide elevator machine room ventilation or air conditioning per code.to function within the temperature range established by the elevator equipment manufacturer including during standby power modes.

C. Equipment furnished by Sound Transit, installed under this Section:

1. Network Switch.

1.02 REFERENCES

A. Reference Standards: This Section incorporates by reference the latest revisions of the following documents:

2. Reference to a device or a part of the equipment applies to the number of devices or parts required to complete the installation.

1.03 SUBMITTALS

A. Submit:

1. Pre-revenue Warranty Maintenance Plan:

a. Submit a detailed Pre-revenue Warranty Maintenance Plan.

2. Shop Drawings: Scaled and Fully Dimensioned Layout that includes plans of pit, hoistway, and machine room indicating equipment arrangement, elevation section of hoistway, details of car enclosures, hoistway entrances, and car/hall signal fixtures.

3. Indicate equipment lists, reactions, and design information on layouts include heat dissipation requirements for machine room and hoist beam load requirements.

4. Power Confirmation Sheets: Include motor horsepower, code letter, starting current, full load running current, and demand factor for applicable motors.

5. Complete control and schematic wiring diagram of the elevator system and subsystems.

6. Elevator controller, including manufacturer's technical data and product data, and interface hardware and software requirements.

7. Within 60 days after Notice to Proceed and before beginning equipment fabrication, submit shop drawings and required material for review.

B. Finish Material: Submit 3-inch by 12-inch samples of actual finished material for review of color, pattern, and texture by Resident Engineer. Compliance with other requirements is the exclusive responsibility of the Contractor. Include signal fixtures, lights, graphics, Braille plates, and mounting provisions.

C. The Contractor shall submit material safety data and product data sheets for all products used by the contractor at the site or which may need to be replaced or added to by the maintenance personnel. Such products include but are not limited to greases, oils and paint. The sheets shall have an index listing each product along with application method, approximate quantity required of the product and the component the product is associated with.

D. Testing Submittals:

1. Submit fiber optic performance test procedure and results.

E. Product Data for Special Elevator Equipment: Submit product catalogs for speakers, cameras, intercom/emergency telephone, Ethernet switch, traveling cable data cables, card reader and door controllers.

F. Operation and Maintenance Manuals:

1. In addition to the requirements stated elsewhere in the Contract Documents, include the following as minimums:

a. Printed Instructions: Three sets of neatly bound instructions explaining all operating features.

b. Complete installation, maintenance, adjustment, removal, and testing instructions and procedures for all elevator equipment and components. All instructions shall be at the adjuster's level and specific to the equipment installed:

1) Include inspection and maintenance standards including wear limits, settings and tolerances.

c. Wiring Diagrams: Include a complete set within each Operation and Maintenance Manual, as well as three individually printed and bound complete sets, of as-installed straight-line wiring diagrams showing the electrical connections of all equipment and all modifications to control circuits. Furnish a legend sheet with each set of drawings to provide the following information:

1) Name and symbol of each relay, switch, or other apparatus.

2) Location on drawings, drawing sheet number and area, and location of all contacts.

3) Location of apparatus, whether on controller or on car.

4) Sequence of operation of apparatus connected with each elevator.

d. Complete software documentation for all installed equipment, including software updates and or revisions during the progress of the Work.

e. Lubricating instructions and schedule, including recommended grade of lubricants.

f. Hoistway cleaning procedures required to meet sign off requirements of L&I.

g. List of Special Tools required for inspection, adjustment, maintenance, repair and testing. Provide special tools to Sound Transit. Special tools shall be the property of Sound Transit and kept in the elevator machine room at all times when not in use.

h. List of recommended spare parts and stock quantities for routine maintenance of the equipment. Include a list of spare parts considered critical and for which long lead time frames (items no available within 48 hours) for acquisition would result in extended equipment down-time.

i. Parts Catalog: Complete parts catalogs listing all replaceable parts including Manufacturer’s identifying numbers, current unit price and ordering instructions. Include the complete parts catalog in each Operation and Maintenance Manual, as well as three separate complete printed sets.

j. The Operation and Maintenance Manual shall contain only information related to the equipment installed. Generic information not relevant to the installed equipment shall not be included.

G. Special Tools:

1. Provide a complete set of special tools and instruments necessary for troubleshooting and making all adjustments on every part of the elevator installation. Any tools that are designed specifically for tasks associated with elevator inspection, maintenance and repair or that are required for these tasks, are special tools.

2. Diagnostic Equipment: Provide all diagnostic test devices complete with instructions, access codes, adjusters’ manuals and set-up manuals for adjustment, diagnosis and troubleshooting of elevator system, and performance of routine safety tests.

3. Storage cabinet: Provide and install a lockable metal cabinet in each elevator machine room of suitable size for the storage of special tools and necessary spare

parts. Cabinet shall be mounted on legs or a pedestal a minimum of 4 inches off the floor. Cabinet to be keyed to Sound Transit standard keying system.

H. Four sets of neatly tagged keys for all switches and control features properly tagged and marked.

1.04 QUALITY ASSURANCE

A. Comply with most stringent applicable provisions of the Code or Authority specified in Article 1.02, herein, including revisions and changes in effect on date of these Contract Specifications.

1.05 DELIVERY, STORAGE AND HANDLING

A. Deliver material in Manufacturer’s original, unopened protective packaging.

B. Store material in original protective packaging. Prevent soiling, physical damage, or moisture damage.

C. Protect equipment and exposed finishes from damage and stains during transportation, erection, and construction.

1.06 WARRANTY MAINTENANCE

A. Pre-revenue Warranty Maintenance:

1. Provide full-service Warranty Maintenance as described in this section. This period shall commence upon installation and extend to the start of Revenue Service:

a. Full-service maintenance shall include standard monthly maintenance, replacement parts, and annual testing.

2. Document completed monthly maintenance during warranty within the installer-provided Maintenance Control Program (MCP) that is kept at all times within the elevator machine room.

3. Provide preventive maintenance as recommended by the manufacturer and in accordance with all applicable codes, during normal working hours. Systematically examine, adjust, clean, and lubricate equipment, parts, components, and subsystems. Repair or replace defective parts using parts produced by the manufacturer of installed equipment. Maintain elevator machine room, hoistway, and pit in clean condition.

4. Defective is defined to include, but not to be limited to; operation or control system failures, performance below required minimum, excessive wear, unusual deterioration or aging of materials or finishes, unsafe conditions, the need for excessive maintenance, abnormal noise or vibration, and similar unsatisfactory conditions.

5. Exercise each elevator during monthly maintenance visits and document in the MCP. Exercising of equipment shall consist of continuous operation through entire run of hoistway for one hour..

6. All warranty and maintenance work shall be performed by a company that has a current code compliant Maintenance Control Program (MCP) on file with L & I. Warranty maintenance shall meet the MCP criteria as outlined in ASME A17.1 as well as all manufacturer’s recommended maintenance.

7. Equipment Manufacturer is responsible for upgrades and revisions of software and documentation of associated revision to the Operations and Maintenance Manual.

8. The Contractor shall document all maintenance and transmit maintenance records to Sound Transit.

B. Extended Warranty Maintenance:

1. Provide Extended Warranty Maintenance for a five-year period commencing at the start of Revenue Service, per Appendix A "Extended Maintenance Services Scope of Work" and as generally described below.

2. Provide full-service preventive maintenance as recommended by the manufacturer and in accordance with all applicable codes, and 24 hour emergency callback service. Systematically examine, adjust, clean, and lubricate equipment. Repair or replace parts as necessary using parts produced by the manufacturer of installed equipment. Maintain elevator machine room, hoistway, and pit in clean condition.

3. 24-hour emergency callback service shall comply with the following response times:

a. Service requests placed between 6:00am and 6:00pm: 1 hour.

b. Service requests other hours, weekends, and holidays: 2 hours.

4. Removal of units from beneficial usage for maintenance purposes shall be coordinated with and approved by Sound Transit, unless removal is necessitated for emergency repair or adjustment. Normal preventive maintenance service shall be performed during off-peak operating hours.

5. All units shall be available for use an average of 98.7% of property hours of operation over each three-month period during Extended Warranty Maintenance service. This includes allowance for equipment out of service time as the result of callbacks, scheduled preventive maintenance, and repairs. Contractor's failure to meet this unit availability provision for two consecutive three-month periods for any single elevator or escalator, or group of units, shall trigger an automatic maintenance audit by Sound Transit. Contractor agrees to expeditiously take corrective action in regard to identified deficiencies. Further, Contractor acknowledges Sound Transit's right to pass cost of said audit to Contractor.

6. All warranty and maintenance work shall be performed by a company that has a current code compliant Maintenance Control Program (MCP) on file with L & I.

7. Equipment Manufacturer is responsible for upgrades and revisions of software and documentation of associated revision to the Operations and Maintenance Manual.

1.07 PERMIT, TEST AND INSPECTION

A. Obtain and pay for permit, license, and inspection fee necessary to complete the installation. Installation will be considered complete when the governing authority of Washington State Department of Labor and Industries has issued a permanent operating permit for each elevator.

B. Perform tests required by the elevator Section of the Washington State Department of Labor and Industries. Perform tests in accordance with procedures described in ASME A17.2.1 inspector's manual for Electric Elevators and as required by the authorities having jurisdiction in the presence of the Resident Engineer.

C. Contractor is not relieved from furnishing and installing work shown or specified which may be beyond requirements of ordinances, laws, regulations or codes.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Approved Manufacturers:

1. Hydraulic Installers: KONE, Otis, Schindler, TK Elevator or Mid-American or approved equal- must be reviewed and approved by Sound Transit and meet APTA grade requirements..

2. Hydraulic Equipment: KONE, Otis, Schindler, TK Elevator or Mid-American or approved equal- must be reviewed and approved by Sound Transit and meet APTA grade requirements..

3. Control Manufacturers: Manufacturers standard controls (non-proprietary) KONE, Otis, Schindler, TK Elevator or Mid-American or approved equal- must be reviewed and approved by Sound Transit and meet APTA grade requirements..

B. Car Enclosure: KONE, Otis, Schindler, TK Elevator or Mid-American or approved equal- must be reviewed and approved by Sound Transit and meet APTA grade requirements. Hoistway Entrance: KONE, Otis, Schindler, TK Elevator or Mid-American or approved equal- must be reviewed and approved by Sound Transit and meet APTA grade requirements.

C. Steel:

1. Sheet Steel (Furniture Steel for Exposed Work): Stretcher leveled, cold rolled, commercial quality carbon steel, complying with ASTM A1008, matte finish.

2. Sheet Steel (for Unexposed Work): Hot rolled, commercial quality carbon steel, pickled and oiled, complying with ASTM A568 and A1011.

3. Structural Steel Shapes and Plates: ASTM A36.

D. Stainless Steel: Type 316 complying with ASTM A167, with standard tempers and hardness required for fabrication, strength, and durability. Apply mechanical finish on fabricated work in the locations shown or specified (Federal Standard and NAAMM nomenclature) with texture and reflectivity required to match Resident Engineer’s sample. Protect with adhesive-paper covering:

1. Non-directional orbital uniform finish: 80 grit orbital sanding over standard mill plate or shape to produce a uniform non-directional satin finish with 90 percent of mill marks removed to match Resident Engineers visual sample.

E. Aluminum: Extrusions conforming to ASTM B221; sheet and plate conforming to ASTM B209.

F. Nickel Silver: Extrusions conforming to ASTM B151/151M.

G. Paint: Clean exposed metal parts and assemblies of oil, grease, scale, and other foreign matter and factory paint one shop coat of rust resistant primer. After erection, provide one finish coat of industrial enamel paint. Galvanized metal need not be painted.

H. Prime Finish: Clean all metal surfaces receiving baked enamel paint finish of oil, grease, and scale. Apply one coat of rust resistant primer followed by a filler coat over uneven surfaces. Sand smooth and apply final coat of primer.

I. Baked Enamel Finish: Prime finish in accordance with Article 2.02F, herein. Apply and bake three additional coats of enamel in the selected solid color.

J. Glass: Laminated safety glass, minimum 9/16 inch thick, conforming to ANSI Z97.1 and CPSC 16 CFR Part 1201.

2.02 EQUIPMENT

A. Equipment shall be the same for all contracts except where specifically noted. Where variations occur, each contract shall be specified separately.

B. Elevators:

1. Number:

a. As specified and as detailed on Issued for Construction Drawings

2. Capacity and Loading Classification:

a. As specified and as detailed on Issued for Construction Drawings

3. Speed: 125 feet per minute.

4. Operational Control: Selective collective, microprocessor-based system.

5. Motor Control: Single speed AC with SCR soft start with closed transition.

6. Power Characteristics: 480 Volts, 3 Phase, 60 Hertz.

7. Stops and Openings: As specified and as detailed on Issued for Construction Drawings.

8. Floors Served: As specified and as detailed on Issued for Construction Drawings.

9. Travel: As specified and as detailed on Issued for Construction Drawings.

10. Minimum Clear Inside Car:

a. Geometry Type A: 5 feet 8 inches wide by 7 feet 10 inches deep.

b. Geometry Type B: 7 feet 8 inches wide by 5 feet 3 inches deep.

11. Entrance Size: 4 feet 0 inches wide by 7 feet 0 inch high.

12. Entrance Type: As detailed in Issued for Construction Drawings.

13. Door Operation: High-speed, heavy duty, master door operator, minimum opening speed 2.5 feet per second.

14. Door Protection: Infrared, full screen device, with differential timing and nudging and interrupted beam time.

15. Machine: Hydraulic pump.

16. Hydraulic Type: In Ground Hydraulic (unless conditions require hole-less - dual telescoping jacks- to be approved by ST.)

17. Hydraulic Jack Assembly:

a. See Article 2.02.H.3 herein.

18. Machine Room: As specified and as detailed on Issued for Construction Drawings.

19. Guide Rails: Planed steel tees.

20. Buffers: Spring.

21. Car Enclosure: As specified and as detailed on Issued for Construction Drawings Car ceiling height of 8 feet.

22. Signal Fixtures: Vandal resistant assembly.

23. Registration Lights: Single hall pushbutton riser. Single car operating panel per entrance. Vandal-resistant car and hall pushbuttons.

    a. Hall buttons and control devices shall be NEMA 4.

24. Position Indicator: Dual digital with direction arrow.

25. Hall Lanterns: At all floors with volume adjustable electronic chime or tone. Sound twice for down direction. Vandal resistant:

    a. Hall lanterns shall be NEMA 4 enclosures at all locations.

26. Hoistway wiring, conduit and enclosures shall be rated for wet locations.

27. Additional Features:

    a. Car roller guides.

    b. Car top inspection station.

    c. Guardrails at car top to meet code requirements for safety.

    d. Firefighters' service, including alternate floor return feature.

    e. Battery pack standby power provision.

    f. Accessibility and emergency medical services access and signage.

    g. Hinged car return panels arranged for integral car operating panels.

    h. Hoistway access switches.

    i. Hoistway door unlocking device. All floors with locking escutcheon plugs.

    j. Independent service feature.

    k. Platform isolation – jack to bolster connection(s).

    l. Firefighters' elevator control panel located in Fire Command Center Room and remote wiring for tunnel station or where required by local AHJ.

    m. Tamper resistant fasteners for signal fixture faceplates.

    n. Sill support angles.

    o. Hydraulic pump unit and controller sound isolation.

    p. Seismic safety valve.

    q. Pad hooks and vinyl-covered pads.

    r. Battery pack emergency car lighting. Provide separate constant pressure test button in car service compartment. Illuminate portion of normal car lighting.

s. No visible company name or logo on any equipment viewable by passengers.

t. Auxiliary car operating panel for dual entry elevators.

u. Wiring diagrams, operating instructions, and parts ordering information.

v. System Diagnostic Equipment and instructions: The elevator installation shall be a design that can be maintainable by any licensed elevator maintenance company employing journeymen mechanics, without the need to purchase or lease additional diagnostic devices, special tools, or instructions from the original equipment manufacturer:

1) Provide onsite capability to diagnose faults to the level of individual circuit boards and individual discreet components for the solid-state elevator controller.

2) If the equipment for fault diagnosis is not completely self-contained within the controllers but requires a separate, detachable device, that device shall be furnished to Sound Transit as part of this installation. Such device shall be in possession of and become property of Sound Transit:

a) Installed equipment not meeting this requirement shall be removed and replaced with conforming equipment at no cost to Sound Transit.

w. L&I Elevator Access Box: High Security Fire Key Box by Quality Elevator Products, Inc. Model SKB-2011 or approved equal. Color: Stainless steel #4 finish cover. Custom Label: “ELEVATOR”. Provide Department of Labor & Industries elevator key cylinder. Locate box as shown on drawings. Refer to Architectural drawings for location.

x. Firefighters' Key Box: Knox-Box Elevator Key Box 1400 Series recessed mount and recessed mounting kit or approved equal. Color: Red. Engrave instructions for use on cover in accordance with Local Fire Authority requirements. Locate box as shown on drawings. Refer to Architectural drawings for location.

y. Keys for elevator access and car operating panel in the machine room.

z. Signage engraving filled with black paint or approved etching process.

28. Etched stainless steel support signs, interior cab only:

a. Material: Stainless steel, etched copy and icon. Attached to interior elevator walls with VHB and silicone.

b. Thickness: 1/8 inch thick with eased edges.

c. Size: 3-inch x 1-1/4-inch.

d. Braille message: Stainless steel braille beads applied below 1/32-inch raised copy and Grade II braille.

e. Color: Reverse etched stainless steel, negative space is painted black.

C. Car - General:

1. Car Speed: plus or minus 10 percent of contract speed under all loading condition.

2. Car Capacity: Safely lower, stop and hold up to 125 percent of rated load.

3. Car Stopping Zone: plus or minus 1/4 inch under any loading condition.

4. Door Opening Time: Seconds from start of opening to fully open:

   a. Two speed, side opening: 2.7 seconds.

   b. Single speed, center opening: 1.8 seconds.

5. Door Closing Time: Seconds from start of closing to fully closed:

   a. Two speed, side opening: 4.0 seconds.

   b. Single speed, center opening: 2.8 seconds.

6. Car Ride Quality

   a. Horizontal acceleration within car during all riding and door operating conditions.

   b. Not more than 20 mg peak to peak in the 1 10 Hertz range.

   c. Acceleration and Deceleration: Smooth constant and not more than 5 feet/second/second with an initial ramp between 0.5 and 0.75 second.

7. Sustained Jerk: Not more than 8 feet/second/second/second.

8. Pressure: For in ground systems fluid system components shall be designed and factory tested for 500 psi. Maximum operating pressure shall be 400 psi. For hole-less dual telescoping jacks, pressure to be designed per the conditions and manufacturers operating requirements- coordinate with ST.

9. Noise and Vibration Control:

   a. Airborne Noise: Measured noise level of elevator equipment and its operation shall not exceed 50 dBA in elevator lobbies.

   b. Noise level in cab shall not exceed 55 dBA for continuous noise or 60 dBA for intermittent noise under any condition including door operation and car ventilation exhaust blower on its highest speed:

      1) All dBA readings to be taken 5 feet off the floor and 1 foot from the wall using the “A”-weighted scale.

      2) Vibration Control: All elevator equipment provided under this Contract, including power unit, controller, oil supply lines, and their support shall be mechanically isolated from the building structure and electrically isolated from the building power supply and to each other to minimize the possibility of objectionable noise and vibrations being transmitted to occupied areas of the building.

   c. Limit noise level in the machine room relating to elevator equipment and its operation to no more than 80 DBA:

      1) All DBA readings to be taken 3 feet off the floor and 3 feet from the equipment using the “A”-weighted scale.

D. Car Equipment:

1. Frame: Welded or bolted, rolled or formed steel channel construction to accommodate load classification requirements.

2. Platform: Constructed of stainless-steel frame with 1/4-inch stainless steel deck. Design and construct to accommodate load classification requirements. Wood construction not permitted.

3. Guide Shoes: Roller type with three or more spring dampened, sound-deadening rollers per shoe. Guide shoes to be designed for the load classification requirements.

4. Finish Floor Covering: 1/4-inch-thick resin epoxy flooring with high solids with colored rubber chips in a troweled mortar system. “SoftTop” Decorative Flooring by General Polymers or approved equal, with “Shark-Grip” Slip Resistant additive to meet coefficient of friction. Color as selected by the Resident Engineer from the manufacturer’s standard.

5. Sills: Extruded stainless steel without extruded extension between car entrance columns to face of car front return. Cast-in-place concrete between sill and tactile warning surface.

6. Toe Guard: Minimum 14-gauge stainless steel, reinforced and braced to car platform, with random orbital finish.

7. Doors: Provide as specified for hoistway entrance doors.

8. Door Hangers: Two-point hanger roller with neoprene roller surface and suspension with eccentric up thrust roller adjustment.

9. Door Track: Bar or formed, cold-drawn removable steel track with smooth roller contact surface.

10. Door Header: Construct of minimum 12-gauge steel, shape to provide stiffening flanges.

11. Door Electrical Contact: Prohibit car operation unless car door is closed within tolerance allowed by Code.

12. Door Clutch: Heavy-duty clutch, linkage arms, drive blocks, and pickup rollers or cams to provide positive, smooth, quiet door operation. Design clutch so car doors can be closed while hoistway doors remain open.

13. Restricted Opening Device: Restrict opening of car doors outside the unlocking zone.

14. Door Operator: High speed, heavy-duty, master door operator capable of opening doors at no less than 2.5 feet per second. Accomplish reversal in no more than 2-1/2 inches of door movement. Open doors automatically when car arrives at a floor. Provide solid state door control with closed loop circuitry to constantly monitor and automatically adjust door operation based upon velocity, position, and motor current. Maintain consistent, quiet, and smooth door operation at all floors regardless of door weight or varying air pressure. Basis of Design: GAL MOVFR or approved equal.

15. Door Control Device:

    a. 3D Infrared Reopening Device: Must meet ASME A.17.1-2019 Black, fully enclosed device. Full screen infrared matrix or multiple beams extending vertically along edge of each leading door panel to minimum height of 7 feet above finished floor. Device shall prevent doors from closing and reverse doors at normal opening speed if beams are obstructed while doors are closing, except during nudging operation. If device fails, provide for automatic shutdown of car at floor level with doors open.

b. Nudging Operation: After beams of door control device are obstructed for a predetermined time interval (minimum 20.0-25.0 seconds), warning signal shall sound and doors shall attempt to close with a maximum of 2.5 foot-pounds kinetic energy. Activation of the door open button shall override the nudging operation and reopen the doors.

c. Interrupted Beam Time: When beams are interrupted during initial door opening, hold door open a minimum of 3.0 seconds. When beams are interrupted after the initial 3.0 second hold open time, reduce time doors remain open to an adjustable time of approximately 1.0-1.5 seconds after beams are reestablished.

d. Differential Door Time: Provide separately adjustable timers to vary time that doors remain open after stopping in response to calls:

1) Car Call: Hold open time adjustable between 3.0 and 5.0 seconds.

2) Hall Call: Hold open time adjustable between 5.0 and 8.0 seconds. Use hall call time when car responds to coincidental calls.

16. Car Operating Panel

a. One car operating panel without faceplate, consisting of a metal box containing the operating vandal resistant fixtures, mounted behind the car enclosure swing return panel(s):

1) Panel shall be located as detailed in the Issued for Construction Drawings and as required by entrance type.

b. Suitably identify vandal resistant assemblies including floor buttons, alarm button, door open button, door close button and emergency stop switch with SCS, Visionmark or Entrada Cast Tactile symbols recessed flush mounted. Configure plates in accordance with Local Accessibility Standards, WAC 296-96-02495, including Braille. Locate operating controls no higher than 48 inches above the car floor; no lower than 35 inches for stop device and alarm button.

c. Provide minimum 3/4-inch diameter raised floor pushbuttons that illuminate to indicate call registration. Include 5/8-inch high designation of the floors served directly to the left of the pushbutton. Provide keyswitches to activate floor pushbuttons at intermediate levels. Platform and surface levels to have pushbutton only:

1) Elevator car call buttons shall indicate floor levels consistent with Sound Transit’s standard floor identification as follows:

a) P = Platform Level.

b) M = Mezzanine Level (1, 2, 3, etc.).

c) B = Basement Level (1, 2, 3, etc.).

d) S = Surface Level.

d. Provide alarm button at bottom of car operating panel to ring bell located on car, and sound distress signal at control panel. Illuminate button when activated.

e. Provide keyed stop switch with markings to show “run” and “stop.” Locate in locked service compartment.

f. Provide “door open” button to stop and reopen closing doors or hold doors in open position. Button operable only while car is stopped at a floor regardless of special operational features, except firefighters’ service.

g. Provide “door close” button to activate door close cycle. Cycle shall not begin until normal door dwell time for a car call has expired, except firefighters’ service.

h. Provide locked Firefighters’ Emergency Operation Panel, openable by the same key which operates the Fire Operation switch. Including the following features:

1) Phase II fire access switch.

2) Firefighters’ visual indication.

3) Call cancel button.

4) Stop switch, manually operated.

5) Door open button.

6) Door close button.

7) Floors served.

i. Provide firefighters’ telephone jack with bezel matching adjacent controls.

j. Provide lockable service compartment with recessed flush door. Door material and finish shall match car return panel or car operating panel faceplate. Door shall contain an integral flush window for displaying the elevator-operating certificate. Inside surface of door shall accommodate mounting provisions for certificate.

k. Include the following controls with function and operating positions identified by engraved signage painted black:

1) Inspection switch.

2) Light switch.

3) 2-speed exhaust blower switch.

4) Independent service switch.

5) Constant pressure test button for battery pack emergency lighting.

6) 120-volt, AC, GFCI protected electrical convenience outlet.

7) Stop switch.

l. Provide black paint filled (except as noted), engraved, or approved etched signage as follows with approved size and font:

1) Car number on main car operating panel.

2) "No Smoking" on main car operating panel.

3) Car capacity in pounds on service compartment door.

4) Phase II firefighters' operating instructions on inside face of firefighters' compartment door.

5) Engrave filled red "Firefighters' Operation" on outside face of compartment door.

17. Car Top Control Station: In accordance with Code. Control station shall be provided with GFCI protected outlet and work light; include on/off switch and lamp guard. An additional GFCI receptacle shall be mounted at bottom of car. Mount to provide utilization while standing in an upright position.

E. Car Enclosure:

1. Provide complete car enclosure as specified herein and detailed on Issued for Construction Drawings. Provide the following features:

a. Shell: Reinforced 14-gauge furniture steel. Apply sound deadening mastic to exterior.

b. Canopy: Reinforced 14-gauge furniture steel with lockable, hinged emergency exit. Interior finish white reflective baked enamel.

c. Front and Rear Return Panels and Integral Entrance Columns: Reinforced 14-gauge non-directional finish stainless steel. Swing entire unit on substantial pivot points (minimum three) for service access to car operating panel(s). Locate pivot points to provide full swing of front return panel without interference with sidewall finish or handrail. Secure in closed position with concealed three-point latching. Provide service compartment with recessed flush cover and cutouts for operating switches.

d. Transom: Reinforced 14-gauge non-directional finish stainless steel full width of enclosure.

e. Car Door Panels: Minimum reinforced 16-gauge non-directional finish stainless steel. Same construction as hoistway door panels.

f. Base: Non-directional stainless steel with concealed ventilation cutouts. Cutouts to be protected from penetration by debris or liquids.

g. Interior Wall Finish: Non-directional finish stainless steel on aluminum honeycomb panels. As specified and as indicated. Refer to architectural drawings for details of elevator cab interiors including metal and glass panel installations.

h. Ventilation: Two speed exhaust blower mounted to car canopy on isolated rubber grommets. Man-D-Tec MVS-AA,, Model AA with diffuser and grille or approved equal.

i. Lighting: Provide minimum average 15 foot-candle illumination at car floor utilizing high output LED fixtures. Provide battery standby power for operation. Provide fixtures with wiring and hookup. Coordinate with emergency lighting requirements. Provide emergency lighting integral with portion of normal car lighting system. Include required transformer:

1) All fixtures shall be above the ceiling and not allow removal without special tools. Fixture replacement shall be able to be performed from within the elevator cab by non-elevator maintenance personnel.

j. Suspended Ceiling: Special design as shown in the Issued for Construction Drawings.

k. Handrails: 1-1/2-inch diameter stainless steel tubes.

F. Operation:

1. Simplex Automatic for single elevators, Selective Collective for elevators located in groups:

a. Approved microprocessor-based, group dispatch, car and motion control systems as follows including, as a minimum, the features described hereafter:

1) MCE Motion 2000.

2) Schindler Miconic HX.

3) Otis Elevonic.

4) Thyssenkrupp TAC 32.

5) Smartrise.

6) Elevator Controls Corp, Pixel.

b. Operate cars as a group, capable of balancing service and providing continuity of group operation with one or more cars removed from the system.

c. Register service calls on cars from pushbuttons located at each floor and in each car. Slow down, and automatically stop cars at landings corresponding to registered calls. Make stops at successive floors for each direction of travel irrespective of order in which calls are registered except when bypassing hall calls to balance and improve overall service; stop only one car in response to particular hall call. Assign hall calls to specific cars, and continually review and modify these assignments to improve service. Simultaneous to initiation of slowdown of a car for a hall call, cancel that call. Render hall pushbutton ineffective until car doors begin to close after passenger transfer. Cancel car calls in the same manner. Give priority to coincidental car and hall calls in car assignment.

d. Operate system to meet changing traffic conditions on a service demand basis. Include provisions for handling traffic, which may be heavier in either direction, intermittent or very light. As traffic demands change, automatically and continually modify group and individual car assignment to provide the most effective means to handling traffic conditions. Assign hall calls to individual cars, continually review and update assignments; provide means to sense long wait hall calls and preferentially serve them; give priority to coincidental car and hall calls in hall call assignment and accomplish direction reversal without closing and reopening doors.

e. Use easily re-programmable system software. Design basic algorithm to optimize service based on equalizing system's response to registered hall calls and equalizing passenger trip time to shortest possible time.

f. Required Features:

1) Dispatch Protection: Backup dispatching shall function in the same manner as the primary dispatching.

2) Delayed Car Removal: Automatically remove delayed car from group operation.

3) Position Sensing: Reset car position when passing or stopping at each landing.

4) Hall Pushbutton Failure: Multiple power sources and separate fusing for pushbutton risers.

5) Duplicate communication link: All group and individual car computers.

2. Do not reverse car direction until all car calls have been answered or until all hall calls ahead of car and corresponding to direction of car travel have been answered.

3. Illuminate appropriate pushbutton to indicate call registration. Extinguish light when call is answered.

4. Other Items:

a. Low-Oil Control: In the event oil level is insufficient for travel to the top floor, provide controls to return elevator to the main level and park until oil is added.

b. Independent Service: Provide controls for operation of each car from its pushbuttons only. Close doors by constant pressure on desired destination floor button or door close button. Open doors automatically upon arrival at selected floor.

c. Auto Operation: Provide field adjustable intermittent automatic operation, to be set initially for once every 3 hours through the entire run of the hoistway. Cycling shall be the full 24 hours each day throughout the year (or can be field adjusted). During such trips, elevator doors shall not open at any landing. Should a landing hall call be registered during auto operation the elevator shall stop auto operation and immediately respond to the hall call.

5. Firefighters' Service: Provide equipment and operation in accordance with Code requirements.

6. Automatic Stopping Zone: Stop car within 1/4 inch above or below the landing sill. Avoid overtravel/undertravel, and maintain stopping accuracy regardless of load in car, direction of travel, or distance between landings.

7. Motion Control: AC type with unit valve suitable for operation specified and capable of providing smooth comfortable acceleration and deceleration. Limit the difference in speed between full load and no load to not more than plus or minus 10 percent of the Contract speed.

8. Door Operation: Automatically open door when car arrives at main floor whether car call has been registered or not.

9. Standby Lighting and Alarm: Car mounted, battery unit with solid state charger to operate alarm bell and car emergency light fixture. Battery to be rechargeable with minimum 5-year life expectancy. Coordinate location of light fixture with Resident Engineer. Provide constant pressure test button in service compartment of car operating panel. Provide lighting integral with portion of normal car lighting system. Include required transformer.

10. Battery Lowering Device: Where emergency power is not provided, upon loss of normal power, provide controls to automatically lower the car(s) nonstop to the lowest landing. Upon arrival at the lowest landing, the elevator doors shall open automatically and remain open until regular door time has expired. The elevator shall then become deactivated. The standby power source shall be provided via 12-volt DC battery units installed in machine room, including solid-state charger and testing means mounted in a common metal container. Battery to be rechargeable lead-acid or nickel-cadmium with a 10-year life expectancy.

11. Provide standby battery power for cab fans. Battery and fans shall provide complete cab air change per minute for a minimum of 1 hour. Upon restoration of normal power, the elevator shall automatically resume normal operation.

12. Automatic Light and Fan Shut Down: The control system shall evaluate the system activity and automatically turn off the cab lighting and ventilation fan during periods of inactivity. The settings shall be field programmable.

13. Elevator Remote Disable: During non-revenue hours, public access to and use of the elevators shall be restricted. The elevators shall be provided with control systems to permit the Link Control Center (LCC) to shut down elevators during non-revenue hours and enable operation during non-revenue hours.

14. Sump High Water Sensor:

    a. Provide sump with water sensor tied to a remote alarm and the Building Management System. System to notify LCC if water has exceeded capacity of sump- Bus Rapid Transit stations and garages exclude.

G. Elevator Machine Equipment:

1. Arrange equipment in spaces shown on Issued for Construction Drawings.

2. Pump Unit: Assembled unit consisting of dry or submersible positive displacement pump, induction motor, master-type control valves combining safety features, holding, direction, bypass, stopping, manual lowering functions, shut off valve, oil reservoir with protected vent opening, oil level gauge, outlet strainer, drip pan, muffler, and all mounted on isolating pads.. When dry pump units are used, enclose entire unit with removable sheet steel panels lined with sound-absorbing material. Provide closed transition SCR soft start. Design unit for 120 upstarts per hour.

3. Pumping Unit Control Valve: The control valve shall be manifold with up, down and check valve sections. A control section including solenoid valves will direct the main valve and control up and down starting, transition from full speed to leveling speed, up and down stops, pressure relief and manual lowering. Down speed and up and down leveling shall be controlled at the main valve sections. All of these functions shall be fully adjustable for maximum smoothness and to meet Contract conditions. The manual lowering feature will permit lowering the elevator at slow speed in the event of power failure or for adjusting purposes.

4. Tank Heater: The tank shall be provided with a temperature sensor which continuously monitors the oil temperature and transmits this information to the controller. Provide a removable thermostatically controlled (min. 500 W) screwed on heater.

5. Oil Cooling System: The oil cooler shall be capable of removing 20,000 BTU/Hour and be provided with an adjustable thermostat. The unit shall be provided with a 10-micron filter in the oil line with a restriction sight glass with bypass in case of plugged filter. The unit shall be capable of being separated into two parts, a fan section and a pump section which can be remotely mounted from one another. The units shall be located in the elevator machine room so as not to inhibit access and maintenance of the elevator equipment.

6. Encoder: Direct drive, solid state or magnetic tape, absolute positioning.

7. Controller: UL/CSA labeled:

   a. Compartment: Securely mount all assemblies, power supplies, chassis switches, and relays, on a substantial, self-supporting steel frame. Completely enclose equipment with covers. Provide means to prevent overheating.

   b. Relay Design: Magnet operated with contacts of design and material to ensure maximum conductivity, long life, and reliable operation without overheating or excessive wear. Provide wiping action and means to prevent sticking due to fusion. Contacts carrying high inductive currents shall be provided with arc deflectors or suppressors.

   c. Use of SIL (Safety Integrity Level) rated devices for EPD (Electrical Protective Devices) where possible is preferred to traditional positively opened mechanical switches. These devices shall be listed/certified and labeled/marked to a SIL rating in accordance with the applicable requirements of IEC 61508-2 and IEC 61508-3 with a SIL rating equal to or greater than the SIL indicated for the applicable device shown in ASME A17.1.

   d. The detection of a dangerous fault (e.g. with diagnostic tests, proof-tests, or by any other means) in SIL rated electrical/electronic/programmable electronic system (E/E/PES, or commonly referred to as "PES") that can tolerate a single fault shall cause the elevator to revert to a known fail-safe condition. Where necessary, to maintain the integrity of the SIL rated PES and maintain the fail-safe condition prior to a second fault that could lead to a dangerous condition, a manual reset shall be required to remove the SIL rated PES from the fail-safe condition.

   e. Microprocessor Related Hardware:

      1) Provide built-in noise suppression devices that provide a high level of noise immunity on all solid-state hardware and devices.

      2) Provide power supplies with noise suppression devices.

      3) Isolate inputs from external devices (such as pushbuttons) with opto-isolation modules.

      4) Design control circuits so that one side of power supply is grounded.

5) Safety circuits shall not be affected by accidental grounding of any part of the system.

6) System shall automatically restart when power is restored.

7) System memory shall be retained in case of power failure or disturbance.

8) Equipment shall operate properly with a 500 kHz to 1300 MHz radio frequency signal, transmitted at a power level of not less than 100 watts Effective Radiated Power (ERP) at a distance of 3 feet.

9) Equipment shall be provided with Electro Magnetic Interference (EMI) shielding within FCC guidelines.

f. Wiring: CSA labeled copper for factory wiring. Neatly route all wiring interconnections and securely attach wiring connections to studs or terminals.

g. Provide controller or machine mounted auxiliary, lockable “off” disconnect if mainline disconnect not in sight of controller and pump unit.

h. Permanently mark components (relays, fuses, and PC board,) with symbols shown on wiring diagrams.

i. Provide reduced voltage motor starting circuits with solid-state motor starter.

8. Muffler: Provide in discharge oil line near pump unit. Design shall dampen and absorb pulsation and noise in the flow of hydraulic fluid.

9. Piping and Oil: Provide piping, connections, and oil for the system. All piping to be ASTMA53, Grade B, seamless schedule 80 steel or better. All piping shall have threaded/welded fittings except that a mechanical coupling shall be provided at the discharge of the power unit and at the connection to the safety valves in the pit. Mechanical fittings shall be Victaulic Type 77, with grade T gaskets or approved equal. Buried piping shall be secondarily contained with watertight Schedule 40 PVC sleeves between elevator machine room and pit. Thermostatically controlled heat tracing and insulation shall be provided for all piping which is exposed to the outdoors, or which is indicated to be insulated on the Issued for Construction Drawings. A minimum of two sound isolation couplings shall be provided between the pump unit and oil line and the oil line and jack unit. Provide isolated pipe stands or hangers as required.

10. Connection to Remote Monitoring Interface Terminal Cabinet:

a. Provide conduit and wiring between the elevator controller and the interface terminal cabinet for remote monitoring and control of each car by the Building Management System:

1) Refer to Electrical drawings for interface terminal cabinet locations.

2) Receive the following dry contact inputs to effect the following control actions for each car:

a) Phase 1 Recall – Primary (from fire alarm panel).

b) Phase 1 Recall – Alternate (from fire alarm panel).

c) Access control permissive.

d) Elevator Remote Disable.

3) Provide normally open dry contacts for each of the following status items for each car:

a) Elevator Warning Alarm.

b) Passenger Alarm Pushbutton.

c) Phase 1 Fire Operation.

d) Phase 2 Fire Operation.

e) Elevator door closed.

f) Independent Service.

g) Elevator at floor (one contact per floor).

b. Provide conduit and wiring between the hoistway sump, high water sensor and the interface terminal cabinet for remote monitoring by the Building Management System:

1) Provide normally open dry contact for each of the following status items for hoistway:

a) Sump high water alarm

H. Hoistway Equipment:

1. Guide Rails: Planed steel T-sections of suitable size and weight for the application, structural support spacing, car weight, and seismic reactions, with brackets for attachment to building structure.

2. Buffers: Spring type with blocking and supports.

3. Hydraulic Jack Assembly:

a. In Ground Hydraulic:

1) Seamless steel pipe. Design head to receive unit-type packing and provide means to collect oil at cylinder head and return automatically to oil reservoir.

2) Provide secondary containment/cylinder protection.

b. Plungers:

1) Polished seamless steel tubing or pipe.

2) If plunger length exceeds 24 feet – 0 inches, provide two or more sections not exceeding 16 feet – 0 inches in length, or coordinate installation of longer unit at the jobsite.

3) Join sections by internal threaded couplings.

4) Multiple section jack units shall be factory polished while assembled and marked.

5) Isolate plunger from car frames.

c. Jack Support and Fluid Shut-Off Valves:

1) Provide steel pit channels to support jack assembly and transmit loads to building structure.

2) Provide intermediate stabilizers as required.

3) Provide manual on/off valves in oil lines adjacent to pump unit and jack units in pit.

d. Well Hole and Casing:

1) Well hole is to be provided by Elevator Contractor. No additional compensation will be allowed for unforeseen conditions of any kind or spoil removal.

2) Install steel outer casing minimum 18" diameter.

3) Install Schedule 80 watertight sleeve over jack assembly for secondary containment prior to installing jack assembly into the outer casing. Extend PVC sleeve through pit floor slab to underside of jack support beams and seal with non-permeable membrane. Seal well opening at the pit floor with hydraulic quick setting cement. Provide PVC vision/access ports.

4) Volume of PVC sleeve shall be capable of containing 110% of system fluid capacity plus jack assembly.

e. Overspeed Valves:

1) Provide a pressure sensitive, mechanically actuated, seismic safety valve.

2) Connect valve directly to jack assembly inlet.

f. Hole-less Assembly-Seamless steel pipe. Two hydraulic cylinders designed to stand upright on the pit floor on either side of the car. Design head to receive unit-type packing and provide means to collect oil at cylinder head and return automatically to oil reservoir. The cylinder shall be finished with rust-inhibiting air-dry enamel. Apply two coats by brush, or spray according to manufacturer’s recommendations.

g. Each cylinder shall have a machined steel flange at the upper end and a heavy steel bulkhead at the lower end.

h. A packing gland with guide bearing, wiper ring and packing especially designed for the hydraulic elevator service shall be mounted at the top of each cylinder along with an oil collector ring and drain hole. The plunger seals shall be urethane cup design with integral wipers or approved equal. Replace the packing glands after all construction is completed.

i. Provide a thermostatically controlled insulated heat tracing assembly on each cylinder to maintain the operating temperature of the oil within acceptable manufacturer’s operating range. Provide product details, ambient operating temperature guidelines and design drawings for review and approval.

j. Plungers: Polished seamless steel tubing or pipe. The plunger surface shall be a minimum of 20 micro inches RMS and shall not exceed 35 micro-inches RMS for the entire plunger length in engagement with the cylinder seals. A stop ring electrically welded to the plunger to positively prevent the plunger from leaving the cylinder. If plunger length exceeds 24 feet, provide two or more sections not exceeding 16 feet in length, or coordinate installation of longer unit at the jobsite. Join section by internal threaded couplings. Multiple section jack units shall be factory polished while assembled and marked for proper future reassembly. Isolate plunger from car frame(s). Each piston in multi-stage jacks to have individual head bearings and packing gland assemblies.

k. Equalization: Provide direct mechanical means of equalizing position and speed of plungers. If speed and position of cylinders are not synchronized the elevator shall self-correct by auto-lowering to lowest floor and restarting. If after two attempts to readjust the position and or speed the plungers are not synchronized the elevator shall shut down.

l. Auxiliary Guides: Plungers shall be provided with an auxiliary guide means as per the manufacturer’s recommendations to maintain the alignment of the jack assembly.

4. Jack Support and Fluid Shut-Off Valve(s): Provide steel pit channels and support beams (if required) to support jack assembly and transmit loads to building structure. Provide intermediate stabilizers as required. Provide manual on/off valve(s) in oil line(s) adjacent to pump unit and jack unit(s) in pit adjacent to jack unit(s). Provide a pipe rupture valve; it shall be located as close as possible to the cylinder inlet. In the event of failure in the pipe line or where the down speed exceeds allowable limits, the rupture valve shall close, bringing the car to a smooth stop.

5. Normal Terminal Stopping Devices: According to Code.

6. Copper Electrical Wiring and Wiring Connections:

a. Conductors and Connections: Copper throughout with individual wires coded and connections on identified studs or terminal blocks. Use no splices or similar connections in wiring except at terminal blocks, control compartments, junction boxes, or conduits. Provide 10 percent spare conductors throughout. Run spare wires from car connection points to individual elevator controllers in the machine room. Provide four pairs of spare shielded communication wires in addition to those required to connect specified items. Tag spares in machine room.

1) All wiring within hoistway shall be suitable for wet locations.

b. Conduit: Painted or galvanized steel conduit and duct. Conduit size, 1/2 inch minimum. Flexible conduit not to exceed 36 inches in length. Flexible heavy duty service cord may be used between fixed car wiring and car door switches for door protective devices:

1) All raceways and wiring mounted on the top of the elevator shall be suitable for wet locations. The routing of the raceways or conduit shall be routed to preclude damage from being stepped on during maintenance. If this is not possible provide steps or other additional protection.

c. Traveling Cables: Type ET flame and moisture resistant outer cover. Prevent traveling cable from rubbing or chafing against hoistway or equipment within hoistway. Refer to “special elevator equipment” for list for spares to be included in traveling cables.

I. Entrance Equipment

1. Door Hangers: Two-point hanger roller with neoprene roller surface and suspension with eccentric up thrust roller adjustment.

2. Door Tracks: Bar or formed, cold drawn removable steel tracks with smooth roller contact surface.

3. Door Interlocks: Operable without retiring cam. Paint interlocks flat black.

4. Door Closers: Spring, spirator, or jamb/strut mounted counterweight type. Design and adjust to ensure the smooth quiet mechanical close of doors.

5. Floor Numbers: Stencil paint 4-inch-high floor designations in contrasting color on inside face of hoistway doors at each landing and adjacent to the leading edge of the door.

J. Special Elevator Equipment: The elevators shall accommodate communication subsystem equipment which shall be provided by the Contract. This equipment and its appurtenances shall be built into the elevator at the factory, unless noted otherwise:

1. CCTV Cameras: Provide and Install two cameras for each elevator:

a. Axis P3364-VE or approved equal.

b. Imaging device: 1/3-inch color CMOS 3-9 mm, vari-focal, auto iris lens.

c. Ability to control and monitor video over IP network.

d. Supported protocols: TCP/IP, UDP/IP (unicast, multicast IGMP), UPnP, DNS, DHCP, RTP, NTP.

e. Supported video resolutions: 4CIF, 2CIF, CIF, QCIF.

f. Digital compression: MJPEG, MPEG-4.

g. Web user interface with up to five simultaneous users.

h. Cameras to support low-light capability.

i. Camera shall be connected by CAT6 to an Ethernet PoE switch located in a Contractor supplied enclosure attached to the elevator cab.

2. CCTV Camera Enclosure: Provide and Install for each CCTV Camera:

a. Install CCTV cameras with protective housings.

b. Mini-dome with integrated camera and lens.

c. Tamper resistant hardware.

d. Rugged, high-impact, puncture-proof, opaque (smoked) dome plastic.

e. NEMA 4X and IP 66.

f. Input voltage: 18 - 30VAC, 24 VAC nominal.

g. Above ceiling dimensions: 2 inches high by 3.5 inches wide, nominal.

h. Below ceiling dimensions: 2.5 inches high by 5.5 inches wide, nominal.

i. Dome diameter: 3.75 inches, nominal.

j. Cable: RJ45-10 connector for 100Base-TX Ethernet.

3. Emergency Communication System: Complying with ASME A17.1 and the U.S. Architectural & Transportation Barriers Compliance Board's "Americans with Disabilities (ADA), Accessibility Guidelines (ADAAG)":

a. "Push to Call," two-way communication instrument in car with automatic dialing, tracking, and recall features with shielded wiring to car controller in machine room. Provide dialer with automatic rollover capability with minimum two numbers.

1) "Push to Call" button or adjacent light jewel shall illuminate and flash when call is acknowledged. Button shall match car operating panel pushbutton design. Provide uppercase "PUSH TO CALL," "HELP ON THE WAY" engraved signage adjacent to button.

2) Provide "Push to Call" button tactile symbol, engraved signage, and Braille adjacent to button mounted integral with car front return panel.

b. Communication for Deaf, Hard of Hearing and Speech Impaired: On the same car operating panel as the phone pushbutton, provide capability to communicate with and obtain responses from passengers, including those passengers who cannot communicate verbally or hear.

c. Provide display video capability for entrapment assessment.

d. Provide two-way communication between car and machine room.

e. On activation, system dials preprogrammed number of monitoring station and identifies elevator location to monitoring station.

f. System provides two-way voice communication without using a handset and provides visible signals that indicate when system has been activated and when monitoring station has responded.

g. System is contained in flush-mounted cabinet, with identification, and instructions for use.

4. PA Speakers:

a. Provide and install an 8-ohm public address speaker in the car canopy and connect via speaker cabling to Contractor provided PA terminals in the interface terminal cabinet.

b. Provide and install Atlas UKT speakers, 95-8-7 backbox, FAMT-6 adapter plate and 60-8A round satin aluminum finish grill or approved equal.

5. Radio Antenna: Provide mounting provisions for Commprod antenna in the elevator cab ceiling. Provide cabling from the car to the interface terminal cabinet. The antenna must be installed only If AHJ requires it:

a. Where AHJ does not require a radio in the cab, designer must confirm there is adequate cell coverage at location of elevator. In the event that there is not adequate cell coverage, radio antenna per above must be provided.

6. For elevators requiring access to non-public floors: Provide and install Lenel 2210 door controller mounted in the NEMA 4X enclosure.

7. For elevators requiring access to non-public floors: Provide and install HID iClass R40 card reader in the elevator cab.

8. ST-provided PoE Ethernet Switch:

   a. Install ST-provided PoE Ethernet switches.

   b. One switch shall be installed in the elevator cab and the other in the Interface Terminal Cabinet.

   c. Minimum of eight ports.

   d. At least one fiber port for switch-to-switch connection.

   e. Connect door controller and cameras to the Ethernet switch via CAT6 cable.

   f. The Ethernet switch in the elevator shall be connected to the Ethernet switch in the Interface Terminal Cabinet via Contractor provided fiber optic cable in the travelling cable.

   g. Power for the switch shall be provided from station's Communications UPS power.

   h. Configuration settings from the Ethernet switch per Sound Transit IT department.

9. Elevator Cab Enclosure: provide a NEMA 4X enclosure, attached to the elevator cab, accessible from inside the cab, sized to install the door controller, Ethernet switch, and fiber distribution panel:

   a. Layout of devices shall provide easy maintenance access.

   b. Provide elevator power to all powered devices in the enclosure.

10. Communications Cabling and Wiring: Provide and install communications systems wiring within the traveling cable from car device to the elevator controller cabinet or the Interface Terminal Cabinet located. Land wiring on terminal blocks or connectors specifically made for the intended use. Provide and install conduit between elevator controller and the Interface Terminal Cabinet:

    a. All cabling to be plenum rated and shall be as follows:

       1) Elevator cab PoE ethernet switch to elevator machine room ethernet switch: 6-strand plastic (multi-mode), or glass (single mode) fiber optic cable. Terminate all strands of the fiber in an FDP with LC connectors on both ends. Provide patch cords from the FDP to the switches.

       2) The fiber cable provided and installed shall be rated so that it can withstand the repeated movement associated with the duty cycle of the elevator (to be noted in product data submittal) while also meeting the Sound Transit performance criteria noted below over the expected life of the traveling cables.

       3) Fiber Optic Performance Criteria:

a) Effective Minimum Bitrate (R) is two times the bandwidth (Δf): R [Mb/s] =2* Δf [MHz]

b) Attenuation Guidelines:

Glass Fiber	
Wavelength (nm)	**Attenuation Rate (db/km)**
1550	0.25
1625	0.25
Max Loss Budget Calculation	
Max Loss Budget [dB] =	(Length[km] * Attenuation Rate) + (Connector pairs * 0.25 dB) + (Number of splices * 0.25 dB)
Plastic Fiber	
Wavelength (nm)	**Attenuation Rate (db/m)**
650	0.2
Max Loss Budget Calculation	
Max Loss Budget [dB] =	(Length[m] * Attenuation Rate) + (Connector pairs * 2.5 dB) + (Number of splices * 2.5 dB)

b. Testing Requirements

1) Minimum Effective Bitrate of 2.5 Mb/sec.

2) Losses determined from OTDR testing within the calculated Max Loss Budget.

Example: 100-meter Elevator Traveling Cable Fiber Optic Criteria		
Fiber Material	**Effective Minimum Bitrate**	**dB Max. Loss Budget**
Plastic	2.5 Mb/sec	25.70 dB
Glass	2.5 Mb/sec	1.73 dB

3) Installing contractor shall demonstrate fiber optic performance via witnessed OTDR dB attenuation testing conducted in accordance with TIA-568-C.0 Compliant Fiber Optic Test Procedures. Fiber cable must meet the above performance upon initial testing and throughout the full life of the traveling cables.

4) Installing contractor to conduct testing for bandwidth to determine effective minimum bit rate over the fully connected traveling cable between nearest elevator machine room network connection switch

and cab network switch. Regardless of traveling cable length, the Effective Minimum Bitrate of 2.5Mb/sec is required.

5) Test results shall be provided to Sound Transit under Submittals.

c. Paging speaker: One copper pair 16 AWG.

d. Radio Antenna: One super flex 75-ohm coaxial cable.

e. Wiegand cabling from the door controller to the access card reader.

f. CAT6:

1) Elevator cab: from the cameras and door controller to the PoE Ethernet switch.

2) Interface Terminal Cabinet: from the PoE Ethernet switch to RJ45 jacks on the interface terminal cabinet.

g. Instrumentation: Minimum 6 shielded twisted pairs; minimum #18-gauge instrumentation cable.

h. Provide four pairs of spare shielded communication wires in addition to those required to connect specified items. Tag spares in machine room.

2.03 COMPONENTS

A. Hoistway Entrances:

1. Complete entrances bearing UL fire labels.

2. Frames: stainless steel at all floors. Standard bolted head to jamb connection assemblies fabricated from not less than 14-gauge material. Permanently attach rear mounted Arabic floor designation plates, centerline at 60 inches above finished floor, on both sides of jambs existing. Provide main egress landing plates with Star designation. Braille indications shall be below Arabic floor designation.

3. Track support 3/16-inch-thick steel track support plate shall extend between and be bolted to the vertical steel struts with a minimum of two bolts each end.

4. Door Panels: 16-gauge random orbital finish stainless steel, sandwich construction without binder angles.

a. Provide leading edges of side opening doors with rubber astragals. Provide a minimum of three gibs per panel, one at leading edge, one at trailing edge and one at center of leaf with gibs in the sill groove their entire length of travel.

b. Elevators in Rated Shaft: Provide safety glass vision panel approximately 4 inches by 20 inches in one panel of each door.

c. Elevators in Non-Rated Shaft: Provide 9/16-inch-thick laminated tempered glass approximately 16 inches by 72 inches in each door panel

5. Sight Guards: 14-gauge, same material and finish as hoistway entrance door panels. Construct without sharp edges.

6. Sills: Extruded nickel silver.

7. Sill Support Angles: Structural steel designed to support doorsill, based upon car loading classification protected from corrosion. Provide grout under the sill. Five-inch by 5-inch by 1/2-inch hot-rolled structural steel angle, extend full width of hoistway. Fasten to building structure at maximum 18 inches on center. Refer to Issued for Construction Drawings for additional details.

8. Fascia, Toe Guards, and Hanger Covers: 14-gauge furniture steel with Manufacturer's standard finish. Provide fascia, toe guards, and hanger covers for rear entrances. Provide fascia for express hoistway travel.

9. Struts and Headers: Provide for vertical support of entrances and related material.

10. Finish of Frames and Doors: Random orbital finish stainless steel.

B. Hall Control Stations:

1. Pushbuttons: Provide one riser with flush-mounted faceplates. Include pushbuttons for each direction of travel, which illuminate to indicate call registration. Include approved engraved message and pictorial representation prohibiting use of elevator during fire or other emergency situation as part of faceplate. Pushbutton design shall match car operating panel pushbuttons. Provide vandal resistant pushbutton and light assemblies. Circuit boards for hall call station switches shall be conformal coated.

2. Hoistway Door Unlocking Device: Provide unlocking device with a locking escutcheon in door panel plug at all floors, with finish to match adjacent surface.

3. Hoistway Access Switches: Mount in entrance frame side jamb at top and bottom floors. Provide fixture with faceplate.

4. Faceplate Material and Finish:

a. Hall Lantern: Non-directional stainless steel.

b. Car Position Indicator: Non-directional stainless steel.

c. Lobby Position Indicator: Non-directional stainless steel.

d. Hall Pushbutton Station: Non-directional stainless steel.

e. Hoistway Access Switch: Non-directional stainless steel

C. Signals:

1. Hall Lantern: Provide at each entrance to indicate travel direction of arriving car. Locate as detailed on Issued for Construction Drawings. Illuminate up or down lights and sound tone twice for down direction travel prior to car arrival at floor. Sound level to be adjustable from 20 80 dBA measured at 5 feet - 0 inches in front of hall pushbutton and 3 feet 0 inches off floor. Illuminate light until the car doors start to close. Provide advanced hall lantern notification to comply with ADA hall call notification time. Minimum 2-1/2 inches in the smallest dimension, arrow lenses with faceplates. Provide vandal resistant lantern and light assemblies consisting of series of dots or lines for maximum visibility.

2. Car Position Indicator: Alpha-numeric digital indicator containing floor designations and direction arrows a minimum of 1/2 inch high to indicate floor served and direction of car travel. Locate fixture in each car operating panel. When a car leaves or passes a floor, illuminate indication representing position of car in hoistway. Illuminate proper direction arrow to indicate direction of travel. Provide vandal resistant indicator and light assemblies.

3. Lobby Position Indicator: Alpha-numeric digital indicator containing floor designations and direction arrows a minimum of 1/2 inch high to indicate floor served and direction of car travel. Locate fixture integral with hall lanterns at Plaza level. When a car leaves or passes a floor, illuminate indication representing position of car in hoistway. Illuminate proper direction arrow to indicate direction of travel. Provide vandal resistant indicator and light assemblies.

4. Floor Passing Tone: Provide an audible tone of no less than 20 decibels and frequency of no higher than 1500 Hz, to sound as the car passes or stops at a floor served.

5. Voice Synthesizer: Provide electronic device with easily re-programmable message and voice to announce car direction, floor, and emergency exiting instructions.

6. Card reader override: Provide conduit and wiring to control panel. Fixtures shall be located as directed by the Resident Engineer. Coordinate size and location.

7. Fire Fighters' Control Panel: Within tunnel stations (or otherwise required by AHJ) locate in the station's Fire Command Center Room. Furnish and install panel and all applicable wiring from each elevator to the fire panel. All supplied conductors shall conform to the requirements of NFPA 130. Associated conduit to be provided by Electrical. Fixture faceplate, No. 4 brushed finish stainless steel, including the following features:

   a. Car position and direction indicator (digital readout or color SVGA display type). Identify position indicator with car number.

   b. Indicator showing operating status of car.

   c. Wiring to panel. Conduit from closest elevator hoistway of each group by others.

   d. Two position fire fighter's emergency return switches and indicators with engraved instructions filled with red epoxy paint.

8. Communication Failure: Provide phone line communication failure indicator light and reset keyswitch integral mounted within hall control station located at the primary phase 1 recall landing.

2.04 SEISMIC OPERATIONS AND EQUIPMENT

A. Provide design, components, and operation in accordance with ASME A17.1, Part XXIV.

PART 3 - EXECUTION

3.01 EXAMINATIONS

A. Prior to beginning installation of equipment, examine hoistway and machine room areas. Verify that no irregularities exist that affect execution of work specified. Hoistway and pit to be evaluated and confirmed as sealed and waterproofed prior to commencing installation of elevator equipment.

B. Do not proceed with installation until work in place conforms to Contract requirements.

3.02 INSTALLATION

A. Install all equipment in accordance with manufacturer's instructions, referenced Codes, these Specifications and approved submittal.

B. Install machine room equipment with clearances in accordance with referenced Codes and these Specifications.

C. Install all equipment so it may be easily removed for maintenance and repair.

D. Install all equipment for ease of maintenance.

E. Install all equipment to afford maximum accessibility, safety, and continuity of operation.

F. Replace or refurbish all material to meet performance requirements outlined in this Section prior to station operation. There will be an extended period of time from the point that the elevators are installed to the final acceptance and station normal operation.

G. Remove oil, grease, scale, and other foreign matter from the following equipment and apply one coat of field-applied machinery enamel:

1. All exposed equipment and metal work installed as part of this work that does not have architectural finish.

2. Machine room equipment, hoistway equipment including guide rails, guide rail brackets, and pit equipment.

3. Neatly touch up damaged factory-painted surfaces with original paint and color. Protect machine-finish surfaces against corrosion.

3.03 FIELD QUALITY CONTROL

A. Perform tests required by the elevator Section of the Washington State Department of Labor and Industries. Perform tests in accordance with procedures described in ASME A17.2.1 inspector's manual for Electric Elevators and as required by the authorities having jurisdiction in the presence of the Resident Engineer.

B. Contractor is not relieved from furnishing and installing work shown or specified which may be beyond requirements of ordinances, laws, regulations or codes.

C. Work at jobsite will be checked during course of installation. Full cooperation with reviewing personnel is mandatory. Accomplish corrective work required prior to performing further installation.

D. Have Code Authority acceptance inspection performed and complete corrective work.

3.04 ADJUSTMENTS

A. Install rails plumb and align vertically with tolerance of 1/16 inch in 100 feet - 0 inches. Secure joints without gaps and file all irregularities to a smooth surface.

B. Static balance car to equalize pressure of guide shoes on guide rails.

C. Lubricate all equipment in accordance with manufacturer's instructions.

D. Adjust motors, valves, controllers, leveling switches, limit switches, stopping switches, door operators, interlocks, and safety devices to achieve required performance levels.

3.05 CLEANING

A. Keep work areas orderly and free from debris during progress of Contract. Remove packaging materials on a daily basis.

B. Remove all loose materials and filings resulting from work.

C. Clean machine room equipment and floor.

D. Clean hoistways, car, car enclosure, entrances, and operating and signal fixtures per submitted procedure as required to meet sign off requirements of L&I.

3.06 DEMONSTRATION

A. General: Furnish labor, materials, and equipment necessary for tests. Notify Resident Engineer 5 days in advance when ready for final review of unit or group. Final acceptance of installation will be made only after all field quality control reviews have been completed, identified deficiencies have been corrected, all Sound Transit’s information and certificates have been received, and the following items have been completed to satisfaction of Resident Engineer.

1. Workmanship and equipment comply with these Specifications.

2. Contract speed, capacity, floor to floor, and door performance comply with these Specifications.

3. Performance of following are satisfactory:

a. Starting, accelerating, running.

b. Decelerating, stopping accuracy.

c. Door operation and closing force.

d. Equipment noise levels.

e. Lighting levels.

f. Signal fixture utility.

g. Overall ride quality.

h. Performance of door control devices.

i. Operations of special security operation and floor lock-off provisions.

j. Demonstrate CCTV Camera image on computer connected to data cable to Interface Terminal Cabinet.

k. Demonstrate that PA system works by connecting to an amp and broadcasting voice over speaker.

l. Demonstrate phone installation by dialing designated ST control center.

m. Demonstrate each monitoring and control signal to Building Management System at Interface Terminal Cabinet.

4. Test Results:

a. In all test conditions, obtain specified speed, performance times, stopping accuracy without re-leveling, and ride quality to satisfaction of the Resident Engineer.

b. Temperature rise in motor windings limited to 120 degrees F above ambient. A full-capacity, 1-hour running test, stopping at each floor for 10 seconds in up and down directions, may be required.

B. Performance Guarantee: Should tests reveal defects, poor workmanship, variance or noncompliance with requirements of specified Codes and/or ordinances, or variance or noncompliance with the requirements of these Specifications, complete corrective work to satisfaction of Resident Engineer at no cost:

1. Replace equipment that does not meet Code or these Specifications requirements.

2. Perform work and furnish labor, materials, and equipment necessary to meet specified operation and performance.

3. Perform and assume cost for retesting required by Governing Code, Authority, and Sound Transit to verify specified operation and/or performance.

C. Field Review Scheduling: Schedule progress and final equipment reviews with Resident Engineer. Reply promptly, in writing, to corrective work indicated on Resident Engineer's progress and/or final review reports, indicating status, schedule for completion, and questions.

3.07 TRAINING

A. Provide orientation and training to familiarize Sound Transit operations personnel with the features and operation of the elevator.

1. Include step-by-step instructions for elevator operations, controls and features, including procedures for locking down elevators when not in service.

2. Training shall include complete familiarization of the elevator and elevator machine room, including components installed within the machine room.

3. Provide training materials that detail step-by-step instructions of elevator operations for use in future familiarization training of personnel.

3.08 COMMISSIONING

A. Refer to specifications Section 14 08 00 Commissioning of Conveying Equipment for further requirements pertaining to the work in this Section.

END OF SECTION

SECTION 14 31 00

ESCALATORS

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for furnishing and installing heavy duty escalators as specified and as detailed on the Issued for Construction Drawings, including maintenance as described herein.

B. Related Work Specified Elsewhere:

1. Wellway and Pit:

a. Clear, plumb, wellway with variations not to exceed 1 inch at any point.

b. Floor pockets and/or structural beams for support of escalator truss at each end and at intermediate locations as shown on the Issued for Construction Drawings. Support beam deflection shall not exceed 1/1666 of span under static load.

c. Fire resistive enclosure of escalator truss including ends, sides, and bottom in ceiling plenum.

d. Patching and finishing around escalator landing plates after installation.

e. Cladding and finishing of exposed truss surfaces.

f. Waterproof pit. All escalator pits shall be provided with indirect drains to prevent accumulation of water.

g. Protect open wellways during construction in accordance with OSHA regulations.

h. Protect escalator truss, steps, landing plates, balustrades, handrails, and special metal finishes from damage.

i. Venting or other means to prevent accumulation of smoke and gas in escalator truss as required by Local Building Code.

j. Fire sprinklers in accordance with local Code requirements with protective guards.

2. Electrical Service, Conductors, and Devices:

a. Light with guard and Ground Fault Circuit Interrupter (GFCI) convenience outlet in each pit and machine room space. Provide wet label fixtures.

b. Three-phase mainline copper power feeder to terminals of each escalator controller in the remotely located control cabinet or room with protected, lockable OFF, disconnect switch.

c. Three-phase copper power feeder with protected, lockable OFF disconnect located in machine room or cabinet for combined combplate and truss heater circuit.

d. The contractor shall arrange and pay for three-phase temporary power with the same characteristics as the permanent power to be made available to the installer at the time of the setting of the truss. Permanent power shall be made available for testing.

e. Single phase copper power feeder to each remote escalator control cabinet heaters with individual protected, lockable OFF, disconnect switch located in machine room space.

f. Single phase copper power feeder to each lower end and upper end escalator pit for balustrade and combplate lighting with individual protected, lockable OFF, disconnect switch located in machine room space.

C. Structural Requirements:

1. The installer shall provide escalator truss mounting angles and intermediate truss supports with attachments, sized as required to install escalators into wellway structural support system shown on the contract drawing.

2. Escalator intermediate support points shall be provided by the installer where indicated on drawings. Details and calculations shall be submitted by the escalator installer for approval by the owner.

3. Reaction loads shall be indicated on Issued for Construction Drawings.

4. Seismic designs shall be based on actual story drift data from the building's structural engineer.

5. Seismic calculations shall be based on the design loadings in this document.

6. Brake load per APTA Requirements:

a. Static brake load (load per step on the total number of exposed steps on the incline) shall be: 1000 mm step: 306kg(674lb).

b. Dynamic brake load (load per step running in the down direction on exposed steps on the incline) shall be: 1000 mm step: 145kg(320lb).

7. Step Load:

a. Step, step chain and motor duty load shall be a minimum step load per step of 1000 mm step: 145 kg(320lbs.).

D. Environmental Requirements:

1. Escalators shall be capable of operating with fully specified performance capability while exposed to the following climatic and environmental conditions:

a. Exterior installations: All escalators shall be treated as being outdoors and designed to meet the requirements of exterior installations. Escalators shall be designed to operate while exposed to the natural elements of weather, including sunlight, rain, slush, snow and ice; all conditions of relative humidity while exposed to salt, deicing chemicals, airborne dust, and debris, and corrosive elements; and a dry-bulb temperature range of -10 to 105 ºF.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. American Society of Mechanical Engineers (ASME):

a. ASME A17.1 Safety Code for Elevators and Escalators.

b. ASME A17.2.3 Guide for Inspection of Elevators, Escalators and Moving Walks.

c. ASME A17.5 Elevator and Escalator Electrical Equipment.

2. American Society for Testing and Materials International (ASTM):

a. ASTM A36 Standard Specification for Carbon Structural Steel.

b. ASTM A167 Standard Specification for Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip.

c. ASTM A568 Standard Specification for Steel, Sheet, Carbon, and High-Strength, Low-Alloy, Hot-Rolled and Cold-Rolled, General Requirements.

d. ASTM A1008 Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability.

e. ASTM A1011 Standard Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy with Improved Formability.

f. ASTM B209 Standard Specification for Aluminum and Aluminum-Alloy Sheet and Plate.

g. ASTM B221 Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles and Tubes.

3. National Fire Protection Association (NFPA):

a. NFPA 70 National Electrical Code.

b. NFPA 101 Life Safety Code.

c. NFPA 130 Standard for Fixed Guideway Transit and Passenger Rail Systems.

4. National Electrical Manufacturers Association (NEMA):

a. Standards Publication No 250-1979. Enclosures for Electrical Equipment.

5. Local AHJ Code Amendments including but limited to:

a. Seattle Building Code (SBC).

6. American Welding Society (ANSI/AWS):

a. ANSI/AWS D1.1 Structural Welding Code-Steel.

b. ANSI/AWS A2.4 Standard Symbols for Welding, Brazing, and Nondestructive Examination.

7. Occupational Safety & Health Administration (OSHA):

    a. 29 CFR Part 1926, Safety and Health Regulations for Construction.

8. Americans with Disabilities Act of 1990 (ADA):

    a. 28 CFR Part 36. ADA Standards for Accessible Design.

9. National Association of Architectural Metal Manufacturers (NAAMM):

    a. AMP 555-92. Code of Standard Practice for the Architectural Metal Industry.

10. Washington Administrative Code (WAC):

    a. Title 296: Department of Labor and Industries; Chapter 296-96: Safety Regulations and Fees for all Elevators, Dumbwaiters, Escalators, and Other Conveyances.

11. APTA Heavy Duty Guidelines:

    a. APTA RT-EE-RP-001-02 REV 3-Heavy Duty Escalator Design Guidelines.

B. Definitions:

1. Terms used are defined in the latest edition of ASME A17.1, Safety Code for Elevators and Escalators.

2. Reference to a single device or part of the equipment applies to the full number of devices or parts required to complete the installation as specified.

3. Machine room refers to the upper pit of each respective escalator.

4. Approved Equal means that it has been reviewed and approved by Sound Transit to meet the requirements of the specifications and Sound Transit Requirements Manual.

1.03 SUBMITTALS

A. Submit:

1. Pre-revenue Warranty Maintenance Plan.

    a. Submit a detailed Pre-revenue Warranty Maintenance Plan.

2. Construction Work Plan for delivery and installation of escalators.

3. Shop Drawings: A scaled and fully dimensioned layout Including: Plan of pit, wellway, indicating equipment arrangement and elevation section of wellway, including Escalator intermediate support points indicated on drawing with all supporting details and calculations.

4. Product information shall be submitted with an index listing each product, along with the application method of the product, approximate quantity of product per escalator, and the component the product is applied to or associated with. Include all elements manufactured by others to be included in the escalator:

    a. Location of lower and upper working points, proposed attachment for escalator truss to entrance structure, intermediate support details, thermal expansion joint, load reactions, rated capacity and speed, handrail details, and machine room space and access.

b. Location of major mechanical and electrical components within truss, electric interface connections, and drainage connections.

c. Electrical layouts showing location of truss lighting, light switches, light fixtures, maintenance receptacles, and safety devices.

d. Schematic and electrical wiring diagrams of power distribution and control systems, including wiring of safety devices and interface connections for remote surveillance for each typical escalator, or group of escalators.

e. Location of operating panel in upper and lower-end balustrades. Show following items:

1) Stop button.

2) Start and direction selection switch.

f. Show location of following items:

1) Outline of escalator truss in profile and plan.

2) Elevation of escalator balustrade.

3) Vertical section through balustrade.

4) Truss midway between working points.

5) Reaction loads and location.

6) Truss stanchion.

7) Track system and supports.

8) Drive system.

9) Step nosing radius at upper and lower ends.

10) Drive chains and gear train.

11) Step chain or step links (including chain pitch, step and trailer wheels).

12) Step assembly (including axle, step tread, frame and riser).

13) Handrail system (including profile, guides, drive and tension device).

14) Support details with vibration isolation (including upper, lower, intermediate and slip joint), balustrade deck cover, interior panels, skirt panels and their moldings.

15) Safety switches and operating devices.

16) Motor and emergency brakes.

17) Floor plates.

18) Speed governor.

19) Metal gauges and identification of finishes.

20) Radial, vertical and horizontal dimensions required for manufacture, and positions of lower and upper working points.

21) Attachment of truss to structure.

22) Major mechanical and electrical components within truss.

23) Drainage and electrical interfaces.

24) Hand and finger guards.

25) Ceiling intersection guards.

26) Vibration isolation.

27) Passenger instruction signs.

28) Emergency stop button; and operating panel in upper and lower balustrades (including stop button, start and direction selection switches, and fault finder receptacle).

29) All bearing ratings, identification and catalog numbers shall be provided.

30) A complete schematic diagram shall be provided for the controller and all electrical devices.

31) Certificate holder: including but not limited to, test certificates for step chain shall be provided for approval.

g. Engraved conveyance number.

h. Power Confirmation Sheets: Include motor horsepower, code letter, starting current, full-load running current, and demand factor for applicable motors.

i. Balustrade elevation: Facsimile outline of escalator balustrade in elevation.

j. Balustrade Section: Vertical section taken completely through balustrade and truss midway between working points.

k. Escalator cladding: Vertical section taken completely through escalator cladding, handrail, and decking at mid-flight at upper and lower deck where handrail and decking are level or parallel to floor.

l. Relationship to adjacent work including modifications of details, dimensions, and configuration for elements to accommodate selected products for Work of this Section.

m. Use AWS symbols for defining type, size, and length of welds. Indicate which welds are to be performed in shop and which welds are to be performed in field.

5. Finish Material: Submit samples of actual finished material for review of color, pattern and texture by Resident Engineer. Compliance with other requirements is the exclusive responsibility of the Contractor:

a. Type 316 stainless steel.

b. Lighting fixtures.

c. Skirt brush device including attachment means.

6. Operations and Maintenance Manuals:

a. In addition to requirements stated elsewhere in the Contract Documents, the Operations and Maintenance Manual shall include the following:

1) Neatly bound sets of written information necessary for proper operation, maintenance and adjustment of equipment. Generic information that does not pertain to the equipment installed shall not be included in the manual. Include the following as minimums:

a) Complete instructions regarding operation and maintenance of the specific equipment and components installed, including disassembly and assembly of drive system, handrail drive assembly and track system:

i) Include a complete functional description of each component of the escalator and complete procedures and step-by-step guide for maintenance, repair and overhaul. Instructions shall be at the adjuster's level and include all necessary measurements, including clearance, gap and torque readings.

ii) Include complete, illustrated, exploded views of all assemblies and a complete, illustrated, exploded view for identifying all system parts.

iii) Include operating instructions specific to each escalator, including location, function and operation of all controls, gauges, indicators and switches, as well as emergency procedures.

b) Complete nomenclature of replaceable parts, part numbers, current cost and warehouse location. If the product source is another vendor, then the installer shall include the name and address of the other vendor.

c) Sample copies of a preventive maintenance chart specific to the installed equipment and components.

d) Descriptions of safety devices.

e) Safety rules, tests and procedures, including testing of all systems and subsystems.

f) Procedures and settings for adjusting safety switches, brake, handrail tension, handrail chain drive tension, step chain tension, track system, and mechanical components, including pictorials. Include all recommended measurement values such as torque and pressure.

g) Instructions for removing the floor plate, replacing comb segments, and removing and installing steps and interior panels.

h) Troubleshooting techniques:

   i) Include a full and complete list of fault and error codes for each escalator.

i) Detailed lubrication and cleaning schedule indicating weekly, monthly, quarterly, semiannual and annual lubrication; and a description of each lubrication point, lubrication type and specification. In addition, a laminated lubrication chart shall be mounted on the controller cabinet and shall include lubrication instructions including recommended grade of lubricants.

j) List of special tools required for escalator inspection, adjustment, maintenance and repairs.

k) List of recommended spare parts and stock quantities for routine maintenance of the equipment. Include a list of spare parts considered critical and for which long lead time frames for acquisition would result in extended equipment down-time.

l) Control and schematic electrical wiring diagrams of the controller, including wiring of safety devices to connections with remote indication and control panels for each escalator and group of escalators.

m) Electrical layout showing placement of lighting, light switches, receptacles, light fixtures, disconnect switches and convenience outlets in the truss envelope and pits.

n) Complete detailed drawings and wiring diagram of escalator fault finding device and connection to annunciator panel.

o) Interface drawing that indicates all related devices.

p) As-Built drawings shall be provided with the Operations and Maintenance Manuals. As-built drawings shall include the same items as indicated in Construction Submittals/Shop Drawings with all items updated to final as-built condition.

q) Straight-line wiring diagram of as-installed escalator circuits, with index of location and function of components, shall be provided with the Operation and Maintenance Manuals. In addition, mount installation wiring diagrams on panels, racked, or similarly protected, in escalator machine room space. Provide one complete reproducible master set rolled and in a protective drawing tube. Maintain with additions of all subsequent changes during the Warranty and Extended Maintenance periods. These diagrams are Sound Transit’s property.

r) Detailed Warranty Maintenance and Revenue Service Maintenance programs, showing functions to be performed and their scheduled frequency.

7. 4 sets of neatly tagged keys for all switches and control features to be handed over to ST with Operations Manual:

   a. All escalators within the same facility shall be keyed identically.

8. Special Tools:

   a. Provide, for each escalator installed, a complete set of all special tools required for escalator maintenance.

   b. Diagnostic equipment: Provide diagnostic test device complete with instructions, access codes, adjuster's manuals, and set-up manuals for adjustment, diagnosis and troubleshooting, and performance of routine safety tests.

B. Transmit:

1. Provide electronic file of all escalator programs and a printed program list.

2. Welder certifications and qualified welding procedures and necessary documentation, as required in, Metal Fabrications for review and acceptance. See Section 05 05 23 - Metal Fastening for required welding submittals/ transmittals and requirements. Including the following information:

   a. Product Data.

   b. Welding Electrodes (including Mill Certifications).

   c. Welding Records and Data.

   d. Inspections and Test Reports.

   e. Submit Weld Inspector Qualifications and NDT Personnel Qualifications.

3. Test Procedures.

4. Certificates and Test Reports - Written certified reports for required tests, recording dates performed, test method, test results, interpretation of results, and recommended action. Include Certificate and Test Reports for following:

   a. Manufacturer's certificate of rated load test.

   b. Manufacturer's certificate for the chain breaking load.

   c. Contractor's standard field test and data report.

   d. Certificate of inspection by the Washington State Department of Labor and Industries

   e. Operating permit issued by the Washington State Department of Labor and Industries

5. Product Data:

   a. Transmit Material Safety Data Sheets (MSDS).

b. Catalogue Cut Sheets of all products identified in Part 2 Products

c. All source testing results, mill certifications, certificate of material origin (for buy America requirements) and certifications of compliance.

1.04 SOURCE QUALITY CONTROL

A. Compliance with Regulatory Agency: Comply with most-stringent applicable provisions of the Code and/or Authority outlined in Article 1.02, herein, including revisions and changes in effect on date of these Contract Specifications.

B. Welding shall be performed in accordance with the requirements of the AWS. Welders shall produce evidence of current certification by the AWS. Source welding inspection and testing shall be performed.

C. Factory Visit:

1. ST may elect to visit the factory where the escalator is being manufactured.

2. The escalator shall be tested in the factory with the controller to be shipped with the escalator prior to shipping and successful compliance with test shall be provided to ST. If ST chooses to visit the factory, they shall observe the steps and chain in operation and test selected devices.

1.05 DELIVERY, STORAGE, AND HANDLING

A. When escalator manufacturing process is complete and facility access is complete, deliver escalators and equipment to Work site in manufacturer’s unopened protective packaging.

B. Transport, handle, and store materials in manner to ensure preservation of material quality and fitness for incorporation in Work. Store material in a manner to facilitate inspection and prevent damage.

C. Erection equipment is subject to review and acceptance by the Resident Engineer upon delivery to Work site. If equipment is deemed by the Resident Engineer to be unacceptable or hazardous to personnel and property, promptly bring to acceptable condition, or remove from Work site. Obtain approval from the Resident Engineer for use of heavy moving and erection equipment supported by station structures prior to use.

D. Protect equipment and exposed finishes during transportation, erection, and construction.

1.06 WARRANTY MAINTENANCE

A. Pre-revenue Warranty Maintenance:

1. Provide full-service Maintenance. This period shall commence upon installation and extend to the start of Revenue Service:

a. Full-service maintenance shall include standard monthly maintenance, replacement parts, below and annual testing.

2. Provide preventive maintenance and callback service during normal working hours. Systematically examine, adjust, clean, and lubricate equipment. Repair or replace defective parts using parts produced by the manufacturer of installed equipment. Maintain escalator control space at upper landing, wellway and pit in clean condition. Defective is defined to include, but not to be limited to; operation or control system failures, performance below required minimum, excessive wear, unusual deterioration or aging of materials or finishes, unsafe conditions, the need for excessive maintenance, abnormal noise or vibration, and similar unsatisfactory conditions.

3. Exercise each escalator during monthly maintenance visits. Exercising of equipment shall consist of continuous operation for one hour. Direction of travel shall be reversed each month.

4. All warranty and maintenance work shall be performed by a company that has a current code compliant Maintenance Control Program (MCP) on file with L & I. Warranty maintenance shall meet the MCP criteria as outlined in ASME A17.1 as well as all manufacturer's recommended maintenance.

5. Equipment Manufacturer is responsible for upgrades and revisions of software and documentation of associated revision to the Operations and Maintenance Manual.

6. The Contractor shall document all maintenance and transmit maintenance records to Sound Transit.

B. Extended Warranty Maintenance:

1. Provide Extended Warranty Maintenance for a five-year period commencing at the start of Revenue Services per Appendix A "Extended Maintenance Services Scope of Work" and as generally described below:

   a. Submit detailed Extended Maintenance and Revenue Service program, showing functions to be performed and their scheduled frequency.

2. Provide full-service preventive maintenance as recommended by the manufacturer and in accordance with all applicable codes, and 24-hour emergency callback service. Systematically examine, adjust, clean, and lubricate equipment. Repair or replace defective parts using parts produced by the manufacturer of installed equipment. Maintain escalator control space, wellway and pit in clean condition.

3. Removal of units from beneficial usage for maintenance purposes shall be coordinated with and approved by Sound Transit, unless removal is necessitated for emergency repair or adjustment. Normal preventive maintenance service shall be performed during off-peak operating hours.

4. All units shall be available for use an average of 98.7 percent of property hours of operation over each three-month period during Warranty Maintenance service. This includes allowance for equipment out of service time as the result of callbacks, scheduled preventive maintenance, and repairs. Contractor's failure to meet this unit availability provision for two consecutive three-month periods for any single elevator or escalator, or group of units, shall trigger an automatic maintenance audit by Sound Transit. Contractor agrees to expeditiously take corrective action in regard to identified deficiencies. Further, Contractor acknowledges Sound Transit's right to pass cost of said audit to Contractor.

5. All warranty and maintenance work shall be performed by a company that has a current code compliant Maintenance Control Program (MCP) on file with L & I.

6. Equipment Manufacturer is responsible for upgrades and revisions of software and documentation of associated revision to the Operations and Maintenance Manual.

1.07 PERMIT, TEST AND INSPECTION

A. Obtain and pay for permit, license, and inspection fee necessary to complete the installation. Installation will be considered complete when the governing authority of Washington State Department of Labor and Industries has issued a permanent operating permit for each escalator.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Approved Manufacturers:

1. KONE.

2. Schindler.

3. Thyssenkrupp.

4. Otis.

5. Mid American.

6. Or Sound Transit approved equal- must be reviewed and approved by Sound Transit and meet APTA grade requirements.

2.02 MATERIALS

A. General:

1. All escalators shall consist of a corrosion resistant truss assembly (galvanized), step-drive units, steps and step chains, driving machine and controller, safety devices, comb and deck plates, handrails and deck trim, newels and balustrades, balustrade lights, and other accessories and appurtenances. The sides and underside of the truss, exterior of the escalator, and machinery spaces shall be enclosed.

2. No wood or wood products shall be used in escalators.

B. Steel:

1. Sheet steel (Furniture Steel for Exposed Work): Stretcher-leveled, cold-rolled, commercial-quality carbon steel, complying with ASTM A1008, matte finish.

2. Sheet Steel (for Unexposed Work): Hot-rolled, commercial-quality carbon steel, pickled and oiled, complying with ASTM A568 and A1011.

3. Structural Steel Shapes and Plates: ASTM A36.

C. Stainless Steel: Type 316 complying with ASTM A167, with standard tempers and hardness required for fabrication, strength and durability. Apply mechanical finish on fabricated work in the locations shown or specified, (Federal Standard and NAAMM nomenclature), with texture and reflectivity required to match Resident Engineer's sample. Protect with adhesive-paper covering.

1. Shapes and bars: ASTM A-276, type 304 or 316, A-554 for tubes.

2. Plate, sheet and strip: ASTM A-240, type 316 for exterior installations.

3. Non-directional orbital uniform finish: 80 grit orbital sanding over standard mill plate or shape to produce a uniform non-directional satin finish with 90 percent of mill marks removed to match Resident Engineers visual sample.

D. Aluminum: Extrusions conforming to ASTM B221; sheet and plate conforming to ASTM B209:

1. Casings and extrusions: Commercial mill finish.

E. Galvanizing:

1. Sheet steel: ASTM A653 as applicable. Coating designation G185.

2. Other galvanizing: ASTM A123, ASTM A153, ASTM A385 or ASTM A386, as applicable.

3. Galvanizing touch-up: Zinc dust coating, MIL-P-21035 or MIL-P-26915.

F. Fasteners:

1. Fasteners shall be compatible with materials being fastened. Fasteners shall be furnished with self-locking nuts or retaining rings (spring washers, toothed disks).

2. Fasteners shall be equal to or of greater corrosion resistance than the most corrosion resistant metals being fastened.

G. Corrosion Protection:

1. After welding, the truss shall be hot dipped galvanized with a coating in accordance with ASTM A90. A 100-percent zinc thermal spray coating to ASNI/AWS C. 18-93 is an acceptable alternative.

2. Cast metal parts such as gear housings, chain sprockets and return station half circles shall be painted with a rust inhibitor primer coat after preparation by sandblasting.

3. Steel parts that are not specified to be galvanized shall be painted to meet High Performance Coating requirements. Bright or uncoated axles, shafts, etc., shall be protected by zinc chromate or chrome plating.

H. Paint: Clean exposed metal of oil, grease, scale, and other foreign matter and factory paint one shop coat of manufacturer's standard rust-resistant primer. After erection, provide one finish coat of industrial enamel paint. Galvanized metal need not be painted.

I. Prime Finish: Clean all surfaces receiving a baked enamel finish of oil, grease, scale, and other foreign matter. Apply one coat of rust-resistant mineral paint followed by a filler coat over uneven surfaces. Sand smooth and apply final coat of mineral paint.

J. Baked Enamel: Prime in accordance with Article 2.02E above. Apply and bake three additional coats of enamel in the selected solid color.

K. All equipment and metalwork installed as a part of this Work, which does not have special architectural finish and which is exposed in the wellway, shall be thoroughly cleaned of oil, grease, scale, and other foreign matter and given one coat of field-applied machinery enamel. Damaged factory-painted surfaces shall be neatly touched up with original paint and color.

L. All natural metals shall be stretcher-leveled, re-squared sheets. All surfaces shall be smooth and without waves.

2.03 EQUIPMENT

A. General Operation

1. Escalators shall be heavy duty escalators suitable for public transit. The escalator design shall incorporate finishes, materials and components to deter and resist vandalism.

2. All escalators supplied within this contract shall be the products of a single manufacturer.

3. Escalators shall be designed for the following conditions:

   a. Hours of operation shall be considered as 24 hours per day, 7 days per week.

   b. Direction of travel shall be considered as either direction, and unit shall be up-and-down reversible. Unit shall be capable of reversing the direction of traveling without significant adjustments or maintenance activity.

   c. Escalator components shall be designed based on the design loads as defined herein, following applied duty cycle during operation:

      1) Three hours with 100 percent design load.

      2) Six hours with 50 percent design load.

      3) Eleven hours with 25 percent design load.

B. Escalator Features:

1. Number: As specified and detailed on the Issued for Construction Drawings.

2. Size: 48 inches wide (40-inch step).

3. Speed: 100 feet per minute (fpm).

4. Maintenance Speed: <= 25 fpm.

5. Rise: As noted on Issued for Construction Drawings.

6. Floors Served: As specified and detailed on the Issued for Construction Drawings.

7. Angle of Inclination: 30 Degrees.

8. Operation:

   a. Escalators in Pairs: Reversible under full load as defined by ASME A17.1.

   b. Single Escalators: Reversible under full load as defined by ASME A17.1.

9. Drive Motor Gear Box: worm or helical.

10. Balustrade Finish: Non-directional stainless steel.

11. Deck Configuration: High.

12. Deck Finish: Non-directional stainless steel.

13. Molding and Trim: Match deck finish.

14. Skirt Panels: Satin finish Stainless steel with anti-friction coating applied.

15. Handrail Color: Black with white inserts.

16. Step Tread and Riser: Cleated and meshed with adjacent step with tread demarcation inserts, tread sides and nosing.

17. Upper Track Radius: 8 feet 6-inch radius.

18. Lower track radius: 6 feet, 6.75-inch radius.

19. Demarcation Color: Yellow.

20. Power Supply: 480 Volts, 3 phase, 60 hertz.

21. Additional Features:

    a. Step demarcation lighting.

    b. Emergency stop buttons.

    c. Caution signs at each landing.

    d. Floor intersection guards.

    e. Truss extensions.

    f. Floor Landing Plates and Landing Plate Extensions as required at adjacent escalators.

    g. Truss and Combplate heaters (480V).

    h. Combplate lighting.

    i. Skirt/balustrade Lighting.

    j. Fault finder mounted in inner deck or at stop switch location.

    k. Intermediate supports located as detailed.

    l. Balustrade mounted passenger detection sensor for sleep mode. Bollard mounted beam type detection sensors are not acceptable.

    m. Oil Water Separator.

    n. Power supply provided as detailed in the Issued for Construction Drawings. Provide a junction box and conduit as needed based on a power supply located at the lower end of the escalator. Power source should be independent and dedicated and not tied to any other system or associated equipment that could interfere with the running of the unit or cause a shutdown.

    o. Anti-slide devices on decks when the outer edge of the deck is 8 inches or greater from the edge of the handrail, or on adjacent escalators when the unobstructed distance between the edge of facing handrails is 12 inches or greater. Anti-slide devices to be a minimum 2 inches diameter by 1 inch height stainless steel with concealed mounting.

    p. Stainless steel frame with polycarbonate glazing for mounting escalator operating permit. One per escalator.

    q. High water level sensor/switch.

22. Performance:

    a. Step Speed: Unit shall be capable of operating at Contract speed under all loading conditions in either direction of travel.

1) Rated speed shall not exceed 100 fpm. The no-load-to-full-load speed shall not exceed 4 percent of the rated speed.

b. Handrail Speed: Consistent with step speed.

c. Provide sleep mode functionality:

1) Provide variable frequency drives (VFD) for reversible escalators in pairs.

2) Provide variable frequency drives for single up-only escalators.

23. Operation:

a. Each unit shall be capable of operating smoothly and quietly at rated speed with synchronized step and handrail operation and speed in either direction of travel.

b. Each unit shall be provided with all controls, programming and equipment necessary to meet the following sleep sequence of operations:

1) Detection sensors at each landing shall continually monitor for passengers boarding and leaving the escalator:

a) Detection of approaching passengers shall occur sufficiently in advance of boarding to allow the escalator to reach full operating speed prior to a passenger walking at normal speed (270 ft/min) reaches the combplate.

2) If no passenger is detected for greater than 3 times the amount of time necessary to transfer a passenger between landings (adjustable), the escalator shall enter a sleep mode:

a) Sleep: Variable Frequency Drive (VFD) ramps escalator speed down to a minimum speed not less than 10 ft/min:

i) The deceleration rate shall not exceed 1.0 ft/sec/sec.

3) Upon detection of a boarding passenger the VFD ramps the escalator speed up 100 ft/min.:

a) The acceleration rate shall not exceed 1.0 ft/sec/sec.

b) The rated speed shall not be exceeded.

4) If a passenger is detected approaching against the direction of escalator travel at the egress landing, the VFD shall ramp the escalator up to rated speed and sound the alarm at the approaching landing before the passenger reaches the combplate.

5) Upon failure of the passenger detection sensor the escalator shall default to continuous operation at rated speed.

24. Seismic Features:

a. Provide slip joints pinned and as designed by a Structural Engineer registered in the State of Washington. Provide sliding assembly based on actual story drift and approved by Sound Transit:

1) The slip joint slide bearings shall not use grease for lubrication.

b. Provide seismic switch to disable escalator if a seismic event occurs. Locate beneath soffit at lower end, or other approved remote location, outside of truss.

25. High Water Sensor:

a. Water level sensors shall be provided in the bottom pit within the truss envelope of each escalator and incorporated into the safety circuit. High water shall stop the escalator and prevent it from being started. When the water level goes down the escalator shall automatically start without reset

26. Remote Stop Features:

a. Provide capability for future implementation of remote stop audible alarm, delay and controlled deceleration as prescribed in NFPA 130 Sections 5.5.2.1.

C. Machine Room Equipment:

1. General: The controller shall be located remotely as indicated in the Issued for Construction Drawings. The limit of wire length between the upper pit of the escalator and the escalator controller is 325 ft.

2. Driving Machine: Worm geared or helical spur gear reduction unit coupled directly to drive motor.

a. V-belt and tooth belt drives shall not be acceptable.

b. Head shaft bearings shall be rated for ABMA L10 200,000 hours.

3. Gear Box Requirements:

a. Gear bearings shall be rated with an ABMA L10 life of 200,000 hours and housed in an oil-tight, dust-proof case. The case shall provide a convenient method of draining the oil.

b. Synthetic lubricants shall be used.

c. Rotating parts shall be provided with a means for lubrication and retention of lubricants.

d. Sealed bearings shall be used.

e. Exposed, moving drive elements shall be protected by metal housings, which shall provide access for lubrication of components.

f. A low oil sensor shall be provided to prohibit starting of the escalator on automatic operation with low oil in the gear case.

4. Fault Finder: Provide fault-locating instrumentation to monitor supply voltage, drive unit, wheels, drive chains, step chains, safety circuits, emergency brake lubrication oil, up thrust switch, handrail entry, broken handrail, skirt switch, top and bottom step chain, or step-link switch, combplate, under/over speed switch, low lubricant level indication, and emergency stop switch. Permanently install fault-finding equipment at each escalator. Provide display to indicate trouble code in outer deck at readily visible location. Design to resist vandalism.

a. Drive Motor: Three-phase, operating at no greater than 1200 revolutions per minute (rpm). The motors shall be totally enclosed with external cooling fins.

b. Design motors to operate in confined, unvented spaces. Motor insulation Class F or greater.

1) Provide heater as required to meet manufacturer's temperature requirements.

c. Motor starting: Incorporate reduced current starting.

5. Brake Requirements

a. Operation: Safely decelerate, stop, and hold rated load in accordance with Code requirements.

1) For escalators operating in the down direction, application of the brakes shall not cause the escalator to stop at a rate greater than 3 feet/second/second.

b. Motor brake:

1) The brake coil shall be insulated to Class F.

2) A monitor shall be provided, and if brake lining becomes insufficient for safe usage, restart of the escalator shall be prevented.

c. Step Band Lock

1) A step band lock shall be manually applied and mechanically engaged to prevent movement of linkages while the escalator is disconnected from its power supply.

2) An electrical interlock that shall prevent escalator drive motors from starting while the step band lock is engaged shall be provided.

6. Controller: Provide manufacturer's standard PLC. Controller shall be capable of all features and modes of operation as specified herein. Wire to identify terminal block studs. Identifying symbols or letters identical to those on wiring diagrams permanently marked adjacent to each component on the controller. Enclose all components in a lockable steel cabinet located in a non-public space outside of the escalator pits. Provide mainline circuit breaker and means to protect against overload and single phasing. Provide Washington State Department of Labor & Industries conveyance number and escalator number on controller cover:

a. The escalator controller shall have one dedicated serial port, which supports RS-232-C signals. It shall be accessible in ladder logic and provide support for point-to-point and slave SCADA communication protocol systems. Alternatively, it must be usable for programming purposes or for access to remote programmers.

b. The escalator control equipment shall contain diagnostic capabilities as required for the ease of complete maintenance. The diagnostic system shall be an integral part of the controller, capable of storing the last 99 safety device faults and provide user-friendly interaction between the service person and the controls. All such systems shall be free from decaying circuits that must be periodically reprogrammed by the manufacturer:

1) A permanently mounted full-color view panel capable of providing fault and operating data shall be mounted external to the pit and protected from moisture.

2) Troubleshooting capabilities shall include the ability to easily identify a single activated switch in a circuit that may include multiple switches.

c. Switchgear and controller shall be mounted in NEMA 4X cabinets with strip heaters and labeled terminal strips.

d. Each control cabinet shall be provided with an integral heat exchanger capable of dissipating built up heat released from the associated controller and drive.

e. Every escalator shall be clearly and permanently marked on the controller with rated load and speed, braking torque, manufacture serial number, manufactured date, and the designated owner identification. Duplicate data plates for all motors, brakes and switches shall be mounted and labeled on the inside of the escalator controller.

7. Operating Devices:

a. Escalators shall have the provisions to be remotely stopped by the LCC. Appropriate conductors and controls shall be provided for future implementation but not connected until directed by Sound Transit. This functions solely as future proofing for possibility of greater connectivity.

b. Controls and Safety Devices - Operating controls:

1) Escalators shall be provided with a soft start feature to prolong the life of components.

2) Escalators shall have key-operated switches, accessible at both upper and lower landings, located on the exterior deck above the newel base. Alternate locations may be used subject to approval by Sound Transit.

3) Each keyed switch shall be clearly and permanently labeled, including starting and direction selection where escalators are reversible.

4) Interlocks shall be provided to bring the escalator to a smooth stop, in either direction of travel, before a change of direction may be made for reversible escalators.

5) The key switch shall be keyed to manufacturer’s standard key system.

8. Control Switchgear (Main): The main control switchgear of an escalator shall contain at least the following devices:

a. Lockable main switch thermal and magnetic motor protection starter for up and down travel, hour counter, auxiliary contactors, phase failure device, phase sequence monitor and ground fault monitor.

b. The indication shall be locked automatically. Reset shall be done by a separate switch installed in the controller. The emergency stop shall not be locked.

c. All terminals shall have identification markings, and all cables shall be provided with cable markers.

d. Relays shall be provided with visual indication that they are energized.

9. Step Drive Assembly: Direct or indirect drive. Machine sprockets at each side over which step chains or step chain rollers: pass and transmit motion from machine to steps. If indirect chain drive is used between machine and drive sprocket, provide emergency brake on drive assembly to automatically set if drive chain fails. Provide roller-type sealed bearings.

10. Stop Switch: Conform to Code:

11. Remote Monitoring Interface: Provide an interface terminal strip mounted within the escalator controller for remote monitoring and control of each escalator by the Building Management System (BMS).

a. Terminal strip shall be of sufficient size to receive all points specified below with additional space for future expansion of 4 points minimum.

b. Terminal blocks: Accept No.14 AWG.

c. Receive the following dry contact inputs to effect the following control actions for each escalator:

1) Remote Stop.

d. Provide normally open dry contacts for each of the following status items for each escalator:

1) Escalator Running/Off.

2) Escalator Traveling Up/Down.

3) Escalator Fail.

4) Escalator Emergency Stop Button.

5) Seismic operation.

6) Truss heater.

7) Combplate heater.

e. Provide conduit and wiring between the escalator pit, high water sensors and the interface terminal strip for remote monitoring by the Building Management System.

1) Provide normally open dry contact for the following status item for the pit:

a) Sump High Water Alarm:

Interface Terminal Strip				
Term Block Label	**Type**	**Operation**	**Dry Contact Function**	
			Opened	**Closed**
S1A S1B	Status	Maintained	Not Running	Running
S2A S2B	Status	Maintained	Traveling Up	Traveling Down
S3A S3B	Alarm	Maintained	Failed	Not Failed
S4A S4B	Status	Maintained	OK	Seismic Operation
S5A S5B	Alarm	Maintained	Truss Heater	OK
S6A S6B	Alarm	Maintained	Pit High Water Level	OK
S7A S7B	Alarm	Maintained	Emergency Stop Button	OK
C1A C1B	Control	1 Second Closure	No Operation	Remote Stop

D. Wellway Equipment:

1. Truss: Steel truss to safely carry entire load of escalator, including all components, all cladding, full-capacity live load and weight of exterior truss with a factor of safety according to Code. Engineer truss to carry the exterior cladding material according to design assuming a dead load of 10 psf. Provide clearly identified exterior cladding support attachment locations on exposed sides and bottom of the entire length of truss. Provide fire resistant galvanized sheet metal exterior cladding at manufacturer’s factory:

a. The deflection of the loaded truss shall not exceed one-thousandth of the span under code required live load.

b. In addition, design truss to carry the weight of Sound Transit provided signs and their associated structural support at located as shown on the contract documents. Assume a dead load of 250 pounds for each sign located as shown on the contract documents.

c. Permanent identification shall be provided on the truss for the centerline at both ends of the escalator and in both transition curves.

d. Permanent mark reflecting track system working point distances shall be provided at both ends of the escalator trusses.

e. Field splices, connections and shims:

1) Field splices shall be rigid and non-deforming and shall maintain alignment.

2) Field modification shall not compromise the required paint and corrosion protection.

3) All shims shall be type 304 stainless steel.

4) Support shims shall not exceed 2 inches.

2. Truss Extensions: Provide truss extensions at upper and/or lower landings as required and/or as shown in Issued for Construction Drawings. End support locations will not be adjusted to accommodate installer's equipment.

3. Noise Control: Provide sound isolation within truss as required to limit noise levels relating to escalator equipment and its operation to no more than 65 Decibels (dBA), measured 3 feet above escalator at any point of its length.

4. Vibration Control: The support angles at both ends of the main truss shall be mounted on isolation pads to prevent trans-mission of noise and vibration to the building structure. Readjustment of the escalator alignment shall be possible at any time by means of jack bolts at the supports. An adjustable intermediate support with isolation shall be provided.

5. Drip Pans: Minimum 1/8-inch galvanized steel drip pans of oil-tight construction beneath pit, machine room, and entire length of trusses. Ensure drip pan is of sufficient strength to withstand the weight of maintenance personnel. Ensure pan extends full inside length and it's wide enough to collect oil drips, water, dirt and anything dropped through the tracks; slope to drain. Provide suitable drains with grease trap at base of each oil pan with removable access plate to sump.

6. Oil Water Separator: For all outdoor or partially outdoor escalators, provide wellway with an oil water separator located at the lower pit.

7. Step Tracks:

    a. Construct from steel. Bolt sections of track, including transitions, to facilitate maintenance and replacement if required. Factory install and align track sections, including transitions, to ensure smooth, quiet operation of running gear under all conditions. Form a fully independent assembly consisting of the individual track section, together with transition section, step chain tension carriage, main drive shaft and handrail drive shaft.

    b. Tracks shall retain steps and running gear safely under load requirements and at the highest speed specified.

    c. Sections of track shall be assembled together for easy removal and replacement of defective sections. The system shall be adjustable. Connecting of track sections by welding is not acceptable.

    d. Design of mechanical components shall provide for easy installation and removal without the dismantling of parts of the structure.

    e. The tracks shall be properly supported on trusses to provide correct alignment and smooth transition on return stations. The rolling surface of the passenger side tract shall be a minimum thickness of 1/8 inch, return side track shall be a minimum thickness of 5/64 inch.

    f. The guiding system for the step chains and step wheels shall be of zinc plated or galvanized steel profiles with smooth and even running surfaces and with the joints cut diagonally to the running direction. The guide profiles shall not be welded together at the joints.

    g. A second, continuous guiding profile shall be provided above the step chain rollers so that the step chains are positively guided in the area of the escalator open to passengers.

8. Step Chains: Steel links with hardened pins connecting adjacent steps and engaging drive sprockets. Provide synthetic composition roller assemblies with sealed bearings. Provide escalator design that permits chain inspection and operation while unit is running with steps removed:

a. Step chain shall be water resistant, low lubrication or lube free, endless, roller-type with one on each side of the step.

b. Step chains shall be heat treated steel construction, supported at intervals by linkage wheels.

c. A means to prevent steps from coming into physical contact with one another and to prevent chains from sagging or buckling shall be provided.

d. A means to maintain constant distance between step axles shall be provided.

e. An automatic tensioning device to maintain tension under load and to compensate for wear shall be provided. The device shall be located within the truss at the lower end.

f. Step chain tensioning device:

1) The step chain tensioning device shall be of a design that keeps the step chains at the correct tension.

2) A pointer and scale shall be required provided to gauge step chain tensioning and wear.

3) Bearings, if used, shall be rated ABMA L10, 200,000.

g. A means to maintain constant distance between step axles shall be provided.

h. Step chains shall be constructed to permit removal of segments as may be required for replacement purposes at a minimum of ever six-axle section. Each escalator shall have at least two one-axle sections.

i. Support wheels spaced to distribute load and to guide linkage throughout the run shall be provided. Rollers shall be constructed of polyurethane material, with a diameter sufficient to provide reliability, maintainability, smoothness of motion and to operate within the noise level requirements specified. The chain rollers shall have polyurethane tires, sealed bearings and diameters of not less than 4 inches... They shall require no additional lubrication. The wheels, hubs and bearings shall have an L10 rating of 100,000 hours:

1) Wheels shall be affixed to permit rapid replacement.

j. Each pair of step chains shall be a matched set within manufacturing tolerances. Only precision, roller fishplate chains of high-grade heat-treated steel shall be used as step chains.

k. Step chain and chain pins shall have a surface pressure at engaging points that shall not exceed 30 N/mm2 (3,450 psi). This is to be based on the step loads as defined in the step chain load requirement.

l. The safety factor shall be a minimum of 6.

m. A shielding device shall be provided to protect chain, track guides and rollers against water, dirt and debris.

n. Step chain lubrication requirements:

1) All parts, requiring lubrication other than sealed items, shall be designed for an automatic or remote lubricating system. The system shall operate only when the escalator is running, and the amount of lubrication shall be fully adjustable. A reservoir with a low-oil signal shall be connected to the controller, and a minimum capacity capable of providing the OEM's required lubrication for one month of operation based on the specific operating hours for this installation, shall be provided.

2) System shall be positive acting, located in the escalator pit.

3) A reservoir level indication shall be provided where lubricants are contained within housings, supply tanks and larger filler cups.

4) A means to maintain lubricant viscosity shall be provided when required.

o. Bearings:

1) Sealed bearings shall be used where possible.

2) Bearings requiring manual lubrication shall be furnished with fittings to accommodate the use of a pressure gun for lubrication.

3) Self-lubricating bearings or material other than ball or roller type.

4) Manual lubrication points shall be easily accessible and available.

9. Step Chain Tension Carriage: Spring tensioning device to take up chain slack and maintain constant tension.

10. Step Assembly: Single piece die-cast aluminum, fastened to the step chain axles. Provide cleated treads and risers. Cover the underside of Steps with sound-deadening material.

a. The steps shall carry the load under maximum concentric and eccentric loading conditions without failure.

b. Die-cast aluminum steps shall not have more than 0.3 percent copper content.

c. The Steps shall be designed to mesh with the combplates.

d. Step and various attachments shall permit removal of steps without disturbing the balustrades or decking.

e. The design shall permit the running of the drive without steps for convenience in cleaning and inspection.

f. Steps shall be constructed so as to be driven by step linkages to step or step rollers.

g. Step rollers shall have polyurethane tires in hubs, sealed roller bearings and a diameter of no less than three inches. Step rollers shall not require any additional lubrication and must be rated for severe, heavy-duty service. Step roller bearings shall have an L10 rating of 100,000 hours.

h. Safety demarcation lines or strips shall be provided in step treads to assist demarcation between treads when they are level at top and bottom landings. Provide contrasting color demarcation lines (yellow) on back edge and sides of treads.

i. The entire assembly shall be treated with not less than one coat of zinc chromate primer or iron phosphate and one coat of power coated enamel for corrosion resistance.

j. Washers and nuts shall be provided as follows:

1) Tap bolts: Lock washers.

2) Through bolts: Lock nuts or approved equal.

11. Safety Devices: Escalator safety devices shall comply with code requirements and include a safety brake activated if the step chains break or the step chain tension drops below a predetermined level; a power supply cutoff to stop the escalator if it overspeeds by some fixed percentage, provision for automatic stopping if the direction of travel is accidentally reversed; and provision for automatic stopping if the treads are separated from the comb plate or the interior skirt panels by a predetermined amount.

a. Use of SIL (Safety Integrity Level) rated devices for EPD (Electrical Protective Devices) where possible is preferred to traditional positively opened mechanical switches. These devices shall be listed/certified and labeled/marked to a SIL rating in accordance with the applicable requirements of IEC 61508-2 and IEC 61508-3 with a SIL rating equal to or greater than the SIL indicated for the applicable device shown in ASME A17.1.

b. The detection of a dangerous fault (e.g. with diagnostic tests, proof-tests, or by any other means) in SIL rated electrical/electronic/programmable electronic system (E/E/PES, or commonly referred to as "PES") that can tolerate a single fault shall cause the escalator to revert to a known fail-safe condition. Where necessary, to maintain the integrity of the SIL rated PES and maintain the fail-safe condition prior to a second fault that could lead to a dangerous condition, a manual reset shall be required to remove the SIL rated PES from the fail-safe condition.

c. Safety devices include-but are not limited to-those required by ASME A17.1 and those listed below:

1) Broken Step-Chain or Step Link Device: A broken step chain or step link device shall be provided to cause the interruption of power to the drive machine if a step chain or step link breaks.

2) Broken Drive Chain Device: When the driving machine is connected to the main drive shaft by a chain, a device shall be provided to cause the application of the brake on the main drive shaft if the drive chain breaks.

3) Skirt Obstruction Device: A device shall be provided to open the power circuit to the escalator driving machine motor and brake should an object become wedged between the step and the skirt

panel as the step approaches either the upper or the lower landing.

4) Heavy duty skirt brushes mounted on the visible side of the skirting with tamper resistant brackets.

5) Reversal Stop Device: A device shall be provided to open the power circuit to the driving machine motor and operate the brake in case of accidental direction reversal while the escalator is operating in the ascending direction.

6) Automatic stop tied to fire alarm.

7) Step up-thrust.

8) Handrail speed.

9) Missing step.

10) Step level.

11) Handrail entry.

12) Combplate impact, and:

   a) Step demarcation UL rated lights suitable for wet locations.

13) Lockable stop switch or disconnect shall be provided in both pits of escalators.

14) A switch shall prevent operation of the escalator if any part of the landing plates are not in place.

15) Speed Governor: A speed governor shall be provided to cause the interruption of power to the driving machine if the speed of the steps exceeds more than 40 percent above the rated speed.

16) Slide Prevention Device: Surface projections shall be provided on the surface of the outer decks between escalators or adjacent to walls to discourage patrons from sliding down the channels.

12. Electrical Wiring:

   a. Conductors: Copper throughout with individual wires coded and all connections identified on studs or terminal blocks. Type SO cable may be utilized for wiring conducting 30 Volts or less, in accordance with NEC 620-621.

   b. Conductors: 31 Volts rms or greater. Provide conduit, junction boxes, connections, and mounting means in accordance with requirements of Section 26 05 33, Raceways and Boxes for Electrical Systems. Provide painted or galvanized steel or aluminum conduit. Conduit size minimum 3/8 inch. Do not use flexible conduit exceeding 18 inches in length.

   c. Galvanized rigid pipe and/or liquid tight flexible metal conduit shall be used in the truss. Liquid tight flexible metal conduit must be CSA/UL approved.

   d. LSHF (low-smoke, halogen free) wiring shall be used where commercially available throughout the escalator installation.

e. In Class 2 circuits, SO cord may be used in lengths not to exceed 3 feet.

f. Liquid tight flexible metal conduit must be CSA/UL approved.

g. PVC may not be used in the escalator installation.

h. All fixtures shall be NEMA 4 where exposed to moisture.

13. Motors:

a. The driving motors shall be AC induction motors with starters. Voltage 480 VAC, three phase, frequency 60 Hz.

b. The motors shall be totally enclosed with external cooling fins.

c. The motor protection class shall be equivalent to IP55 insulation group F.

d. Driving motors and motor switchgear shall provide a smooth start.

2.04 COMPONENTS

A. Handrails

1. Design handrails for outdoor use. The handrail shall be a composite of either vulcanized rubber or an approved equal with a synthetic fabric slider and shall be constructed with a steel cable tension member providing a minimum strength of 25 kN over the splice area. Provide white inserts in black handrail, at least one insert shall be visible at all times at the end returns of the handrail.

a. Handrails shall receive their motion from the main escalator drive through direct gearing and drive shaft or drive chains, so that the handrail and steps operate at the same speed in each direction of travel. Driving and guiding wheels shall have a groove to accept the wedge on the underside of the handrail. The handrail shall have a V-shape wedge.

b. A means to take up handrail slack using a tensioning device, where required, shall be located within escalators. In addition, a method of releasing the device for repair or removal of handrails shall be provided.

c. Newels shall be designed and constructed so that the handrail will return into the newel end at a point inconspicuous and difficult for passengers to reach.

d. Newel sheaves shall be provided at the upper and lower newels.

e. The handrail drive system and guides shall be designed and installed so that the handrail cannot be thrown off or disengaged while running and special design attention shall be given to the area where the handrail passes from the drive system to the guides.

f. Handrail rollers shall have sealed bearings rated at ABMA L10, 100,000 hours.

g. Friction drive sheaves and idlers shall be designed and positioned so that lubricant cannot reach the surface of the handrail. Marking and spotting of the handrail by drive equipment shall not be permitted. Provide sealed bearings rated at ABMA L10, 100,000 hours.

h. Handrail guides shall be:

1) Continuous on the exposed portion of the handrails.

2) Constructed of type 316 stainless steel.

3) Shall not be subject to corrosion nor pitting.

4) Shall have a polished or specially coated permanent finish to minimize frictional wear to the under surface of the handrail.

5) On the unexposed portion, guiding shall be by adjustable rollers having sealed.

i. Handrail gearbox, if provided, shall have bearings rated at ABMA L10, 200,000 hours.

B. Balustrade:

1. Panels shall be a minimum of 1/8 inch solid type 316 stainless steel and backing panels, where used, shall be noncombustible and are subject to owner approval. Glass balustrades are not permitted.

2. Balustrades shall have no sharp edges or pinch points.

3. Panels shall be constructed, when practical, in equal lengths for interchangeability.

4. Panels shall be attached to permit easy removal for inspection, lubrication and adjustment of safety devices.

5. Panels shall be sized so that no more than two people are required to remove a panel, and without the aid of special handling equipment.

6. Requirements for exposed panel fasteners (where used): Panels shall be fastened to their respective supports or mating portions with tamperproof flathead machine screws.

7. When the framework to which panels are fastened is less than 1/4 inch thick, steel backup plates with a minimum 1/4-inch thickness shall be added. These plates shall have tapped holes or clearance holes where necessary.

8. Provide anti-slide devices on adjacent surfaces between escalators, stairs, or between escalator and walls to meet code.

9. Skirt Panels: Install to maintain clearance of step treads to skirt of not more than 3/16 inch. Extend skirt panel beyond combplates and wrap around base of newel. Panel reinforcing: Suitable for moist environment.

a. Skirt panels shall be a minimum of 1/8 inch thick solid type 316 stainless steel.

10. Deck Boards: Abut all deck section to one another to provide a smooth surface-to-surface connection with butt joint transition, top and bottom, and horizontal to inclined sections.

a. Decking shall be a minimum of 1/8 inch thick solid type 316 stainless steel, identical in finish to balustrade.

b. Decking between escalators shall be designed to support a live load of 175 lb./ft^2 without permanent deformation.

c. Paneling, decking and other enclosures shall be supported on a steel frame.

11. Finishes:

a. Interior Panels: Non-directional finish stainless steel reinforced vertical panels with section joints vertical to escalator incline, flush inclined panel from skirt to handrail guide above.

b. Skirt Panels: Non-directional finish stainless steel.

c. Outer Deck: Non-directional finish stainless steel.

12. Trim and Moldings: Manufacturer's standard finish.

13. Floor Intersection Guards: Provide clear Plexiglas intersection guards at floor penetrations as required according to Code.

14. Extended Newels: Align newels of adjacent escalators at upper and lower landings.

C. Landings:

1. Flat Steps: Provide upper and lower landings with a minimum of three flat steps.

2. Combplates Assembly: Aluminum or other alloy provided with non-slip surface. Provide removable comb sections. Combplates shall provide a visual contrast with the steps either by color, pattern or texture. Provide combplate lighting in skirt panel on both sides of units at both upper and lower landings.

a. Complete assemblies of wear-resisting, noncorrosive metal material with exposed anti-slip surfaces shall be fabricated.

b. A separate switch for vertical and horizontal detection shall be provided.

c. Comb plate sections shall be removable to permit ease of replacement.

d. Provisions for lateral and vertical fine adjustments shall be provided so that cleats of step treads pass between comb teeth with minimum clearances.

e. Provide heaters for comb plate assemblies to eliminate buildup of ice.

f. Provide step demarcation lights at lower and upper ends of escalator immediately outbound of the combplate.

3. Landing Plates: Extruded or die-cast aluminum in a ribbed pattern transverse to the escalator axis. Ribs shall be designed to provide maximum traction and finished to match combplates. Extend plates from combplates to equipment access plates at upper and lower ends. Extend plates full width of truss. At locations where two escalators are adjacent, provide separate landing plates designed to allow adjacent escalators to remain operational while work is being performed only one escalator.

a. Shall have type 316 stainless steel frames at floor openings, designed to be supported on truss heads.

b. Shall be reinforced, as necessary, to be rigid and able to withstand a live load of 250 lb. /feet^2 with zero permanent deformation.

c. Shall have exposed portions constructed of material and finish to harmonize with steps and combplates.

4. Equipment Access Plates: Aluminum or other alloy with non-slip surface. Provide removable access plates to provide for entry into equipment spaces at upper and lower ends. Cover entire truss openings with plates. Match access plate to material and finish of adjacent landing plates. Provide landing plate and access floor plate without visible manufacturers name or logo.

D. Signal and Control Fixtures

1. Provide upper and lower newel or stanchion-mounted operating stations. Mount on right side when facing unit. Match deck finish. Identify Function and operating positions of switches and buttons with engraved characters that are readily visible from a standing position. Include the following at each station:

a. Red emergency stop button. Cover the button with a transparent cover that can be readily lifted or pushed aside. When the cover is moved, ensure an audible warning signal is activated. Ensure the signal has a minimum sound intensity of 80 dBA at the button location. Engrave the cover EMERGENCY STOP; MOVE COVER or equivalent legend (for example LIFT COVER); and PUSH BUTTON. EMERGENCY STOP in letters not less than 1/2 inch high. Engrave other required wording in letters not less than 3/16 inch high. Ensure the cover is self-resetting.

1) Provide emergency stop buttons at upper and lower landings; stop/start buttons inaccessible to the public on site; and a status monitoring control panel that may be remotely monitored in the LCC.

2) Emergency stop buttons shall cause an alarm at the LCC when activated.

b. Key switch to start unit.

c. Key directional control switch.

1) Each keyed switch shall be clearly and permanently labeled, including starting and direction selection.

d. Interlocks shall be provided to bring the escalator to a smooth stop, in either direction of travel, before a change of direction may be made.

e. Engraved Washington State Department of Labor & Industries conveyance number and escalator number.

E. Skirt/Balustrade Lighting

1. Provide LED skirt or balustrade panel lighting along entire path of travel on both sides of the unit.

a. Elongated round fixtures composed of multiple LED lights and protective cover.

1) Combplate light fixture or similar.

2) Fixtures spaced at 1-foot nominal interval.

3) Lighting shall provide a minimum of 1 foot candle (FC) at all points along entire path of travel, at tread level under emergency conditions.

2.05 ACCESSORIES

A. Signs:

1. Landing Signs: Provide caution signs at top and bottom landings according to Code, engraved plate with material and finish to match decking.

B. Key box:

1. Provide a keybox with hooks suitable for storing all escalator keys. Locate within Fire Command Center room.

a. All keys necessary for access, resetting or technical adjustment of escalators shall be included.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Site Verification of Conditions

1. Prior to beginning the installation of equipment, examine wellway and pit areas. Verify that no irregularities exist that would affect quality of execution of work specified.

2. Do not proceed with installation until work in place conforms to Contract requirements.

3.02 INSTALLATION

A. Install all equipment in accordance with Manufacturer's instructions, referenced codes, Contract Specifications, and approved Submittals.

B. Install all equipment for ease of maintenance.

C. Install all equipment to afford maximum accessibility, safety, and continuity of operation.

D. Replace or refurbish all material to meet performance requirements outlined in these Contract Specifications prior to station turnover for normal operation. There will be an extended period of time from the point that the escalators are installed to the final acceptance and station revenue service operation.

E. Remove oil, grease scale, and other foreign matter from the following equipment and apply one coat of field-applied machinery enamel.

1. All exposed equipment and metal work installed as part of this work that does not have architectural finish.

2. Machine room equipment and truss.

3. Neatly touch up damaged factory-painted surfaces with original paint and color. Protect machine-finish surfaces against corrosion.

F. Coordinate access and escalator work with work of other trades for proper time and sequence to avoid construction delays. Use benchmarks, lines, and levels designated by Contractor to ensure dimensional coordination of Work.

G. Warp finish floor to level with the escalator floor plates but do not lay floor around escalator openings until escalator has been installed. Coordinate as required for installation.

H. Inspect site and verify embedded items are provided and correctly installed.

I. In event of notice of delay for access to Work, site storage at Contractor's facility will be required.

3.03 FIELD QUALITY CONTROL

A. Perform tests required by the Elevator Section of the Washington State Department of Labor and Industries. Perform tests in accordance with procedures described in ASME A17.2 Inspector's manual for Electric Elevators and Escalators and as required by the authorities having jurisdiction in the presence of the Resident Engineer.

B. Work at the jobsite will be checked during the course of installation. Full cooperation with reviewing personnel is mandatory. Accomplish corrective work required prior to performing further installation.

C. Have Code Authority acceptance inspection performed and complete corrective work.

3.04 ADJUSTING

A. Track alignment: Re-align factory installed tracks if required to ensure continuous four-point contact with step and chain rollers. Secure joints without gaps and file irregularities to a smooth surface.

B. Lubricate all equipment in accordance with Manufacturer's instructions.

C. Adjust motors, brakes, controllers, stopping switches, and safety devices to achieve required performance levels.

D. Adjust brakes and controlled descent devices to stop escalator with variable load without toppling passengers. Drive machine brakes shall stop the down running escalator at a rate no greater than 3 feet/second/second.

E. Adjust handrail speed to coincide with step speed.

3.05 CLEANING

A. Keep work areas orderly and free from debris during progress of Contract. Remove packaging materials on a daily basis.

B. Remove all loose materials and filings resulting from work.

C. Clean machine room equipment, truss interior, and pit.

D. Clean balustrades, deck boards, skirt panels, operating and signal fixtures, and trim.

E. Before Substantial Completion, remove all protective coverings and wrapping.

3.06 DEMONSTRATION

A. General: Furnish labor, materials, and equipment necessary for tests. Notify Resident Engineer five days in advance when ready for final review of each escalator unit or group. Final Acceptance of installation will be made only after all field quality control reviews have been completed, identified deficiencies have been corrected, all Sound Transit's information and certificates have been received, and the following items have been completed to satisfaction of the Resident Engineer. Coordinate with Section 14 08 00 - Commissioning of Conveying Equipment, on commissioning requirements.

1. Workmanship and equipment: Comply with these Contract Specifications.

2. Contract speed and performance comply with these Contract Specifications.

3. Performance of following is satisfactory:

    a. Starting and running.

    b. Controlled descent.

    c. Stopping.

    d. Equipment noise levels.

    e. Signal and operating devices.

    f. Overall ride quality.

    g. Handrail speed.

    h. Safety devices.

4. Test Results:

    a. In all test conditions, obtain specified speed, handrail speed, controlled descent performance, stopping, ride quality, and operation noise levels to satisfaction of the Resident Engineer.

    b. Temperature rise in windings limited to 50 degrees C above ambient.

B. Personnel, Equipment, and Instruments: Furnish personnel, equipment, and instruments to perform required tests. The following instruments may be necessary to complete the tests:

1. Multi-meter.

2. 500-volt Megger.

3. Alternating current voltmeter and ammeter.

4. Celsius-calibrated thermometers (two minimum).

5. Precision tachometer.

6. Decibel meter for noise test.

7. Test weights for brake test.

C. Operating Tests:

1. Overspeed Protection Device: Test by operating at rated speed, tripping overspeed device manually.

2. Handrail-Tension Device: Test manually.

3. Broken Drive Chain Devices: Test by operating at rated speed, tripping broken chain device manually.

4. Insulation-Resistance Test: Test safety circuit and motor winding circuit at 500 volts. Minimum resistance to ground: 1 megohm.

5. Running Test: Submit certified copy of type test based on Item 320.6 of ASME A17.2.3 - Guide for Inspection of Elevators, Escalators and Moving Walks.

6. Demonstrate functionality of all remote monitoring and control terminations at ITC.

7. Sleep Mode: Test by verifying that the escalator meets the specified sequence of operations.

D. Field Review Scheduling: Schedule progress and final equipment reviews with the Resident Engineer. Reply promptly, in writing, to corrective work indicated on the Resident Engineer's progress and/or final review reports, indicating status, schedule for completion, and questions, diagnosis, and troubleshooting of escalator system.

3.07 TRAINING

A. Provide 2–4-hour sessions of onsite training for Sound Transit representatives in the proper use, operations and daily maintenance of escalators. The training shall:

1. Review emergency provisions, including emergency access and procedures to be followed at the time of failure in operation and other building emergencies.

2. Train ST personnel in normal procedures to be followed in checking for sources of operational failures or malfunctions.

3. Train Sound Transit personnel in escalator startup inspection requirements in accordance with ANSI A17.1 Section 8.6.11.6.1 through 8.6.11.6.4

4. Provide written documentation and instructional materials describing operational procedures covered during training for Sound Transit use in training future personnel.

END OF SECTION

SECTION 21 05 00

COMMON WORK RESULTS FOR FIRE SUPPRESSION

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for complete Fire Protection systems indicated on the drawings and this division’s specifications. The Contract Documents and General Requirements of the specification are a part of this division of the specification.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. Authorities Having Jurisdiction (AHJ) Current Fire Code and Building Code.

2. International Code Council (ICC):

a. International Building Code (IBC).

b. International Fire Code (IFC).

3. National Fire Protection Association (NFPA):

a. NFPA 13 Standard for the Installation of Sprinkler Systems.

b. NFPA 14 Standard for the Installation of Standpipe and Hose Systems.

c. NFPA 24 Standard for Installation of Private Fire Service Mains and Their Appurtenances.

B. Definitions:

1. Finished Spaces: Spaces other than mechanical and electrical equipment rooms, furred spaces, pipe chases, unheated spaces immediately below roof, space above ceilings, unexcavated spaces, crawlspaces, and tunnels.

2. Exposed, Interior Installations: Exposed to view indoors. Examples include finished occupied spaces and mechanical equipment rooms.

3. Exposed, Exterior Installations: Exposed to view outdoors or subject to outdoor ambient temperatures and weather conditions. Examples include rooftop locations.

4. Concealed, Interior Installations: Concealed from view and protected from physical contact by building occupants. Examples include above ceilings and in chases.

5. Concealed, Exterior Installations: Concealed from view and protected from weather conditions and physical contact by building occupants but subject to outdoor ambient temperatures. Examples include installations within unheated shelters.

1.03 SUBMITTALS

A. Submit:

1. Drawings:

a. Drawings are diagrammatic, indicating the general arrangement of systems and work. Examine the architectural drawings for exact location of fixtures and equipment. Where they are not definitely located, obtain this information from the Resident Engineer.

b. Follow drawings in laying out work and check drawings of other trades to verify spaces in which work will be installed. Maintain maximum headroom. If space conditions appear inadequate, notify the Resident Engineer before proceeding with the work. Make reasonable modifications in the work without extra cost as needed to prevent conflict with work of other trades and for proper execution of the work.

2. Product Data: For each type of product indicated.

3. Valve Schedule: Submit valve schedule organized by location and piping system using MS Word, 8.5 x 11 inches portrait orientation with title, headers, rows, and columns to serve as a maintenance reference. Tabulate valve type, valve-identification number, location. Identify system control valves that are intended for emergency shut-off and similar special using a column or “flag” in the margin of schedule. Furnish copies in riser rooms in a wall-mounted record box and submit with maintenance manuals.

4. Samples: Submit samples of each color, lettering style, and other graphic representation required for each identification material or system.

5. Documentation:

a. Provide as-built drawings of all building plans in accordance to Division 01 As-Built Documents specification. As-Built drawings must include as a minimum the location and performance data on each piece of equipment, general configuration of pipe distribution system, including sizes, and water design flow rates of the actual installation. As-Built drawings must also incorporate any work which deviates from the contract drawings, including changes resulting from addenda, Requests for Information, and Change Orders. Neatly draft changes on clean “hard copy” drawings to show the work clearly in the actual locations as built.

6. Operating Instructions:

a. Provide operating and maintenance instructions in accordance with Section 01 78 23 - Operation and Maintenance Data.

7. The training of the appropriate maintenance staff for each equipment type and/or system must include, as a minimum, the following:

a. System/Equipment overview (what it is, what it does and which other systems and/or equipment does it interface with).

b. Review of the available operations and maintenance (O&M) materials in accordance with Section 01 78 23 - Operation and Maintenance Data.

c. Review of the Record Drawings on the subject system/equipment, including valve schedules and zone distribution.

d. Hands-on demonstration of all normal maintenance procedures, normal operating modes, and all emergency shutdown and startup procedures.

1.04 QUALITY ASSURANCE

A. Material and Work:

1. Materials and equipment required for the work must be new and must be furnished, delivered, erected, installed, connected, and finished in every detail; and must be selected and arranged to fit properly into the building spaces. Where no specific kind or quality of material is given, an article as approved by the Resident Engineer must be provided.

2. Furnish the services of an experienced superintendent, who must be constantly in charge of the work.

3. Equipment and materials must be installed with the approval of the Resident Engineer in accordance with the recommendations of the manufacturer. This includes the performance of such tests as the manufacturer recommends.

B. Accessibility:

1. Install the work with adequate clearances throughout the project, including being responsible for the sufficiency of the size of shafts, chases, double partitions, and suspended ceilings. Such spaces and clearances must be kept to the minimum size required.

2. Locate all equipment that must be serviced, operated, or maintained in fully accessible positions. Minor deviations from drawings may be made to allow for better accessibility and any change must be approved by the Resident Engineer.

3. The Fire Protection Subcontractor must provide the General Contractor the exact locations of access panels for each concealed valve, or other device requiring service. Access panels will be provided and installed by the General Contractor and as specified in the other divisions of the specifications. Submit locations of these panels to the General Contractor in sufficient time to be installed in the normal course of work.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Deliver materials and equipment in original, sealed containers or packages in an undamaged condition complete with labels and instructions for handling, storing, unpacking, protection and installing.

B. Deliver pipes and tubes with factory-applied end caps. Maintain end caps through shipping, storage and handling to prevent pipe end damage and corrosion, and to prevent entrance of dirt, debris, and moisture.

1.06 PROJECT CONDITIONS

A. Electrical Connections:

1. The power wiring and control wiring associated with fire suppression elements must be coordinated and provided by the Contract. Motors and equipment must be provided for current characteristics as indicated on the electrical drawings and be coordinated within the Contract to ensure proper function.

2. Provide control and electrical wiring details including power supply connections for any dry systems and accessories (including air compressors) requiring power and

control or any electrically activated valves that require interface with control systems.

B. Cutting and Patching:

1. Provide drilling, coring, cutting, and patching necessary to install the work specified in this division. Patching must match adjacent surfaces.

2. No structural members must be cut or core drilled without the approval of the Resident Engineer. Do not damage or endanger any portion of the project or work of the Owner or any other separate contractor by drilling, coring, cutting, patching, excavating, and backfilling.

3. Inform the General Contractor and other subcontractors affected of requirements for cutting and patching.

C. Boxes, Sleeves, and Chase:

1. Inform the General Contractor of requirements for boxes, sleeves, and chases. The General Contractor must set boxes, sleeves, and chases. Furnish General Contractor with the boxes and sleeves and be responsible for informing General Contractor of required location.

1.07 WARRANTY

A. The warranty disregards shorter time limits by any manufacturer of equipment provided.

B. Make all necessary adjustments and corrections during first year of operation. The fact that the Resident Engineer was present during any construction does not relieve the Contractor from responsibility for defects discovered after completion of the work.

PART 2 - PRODUCTS

2.01 COMPONENTS

A. Pipe Markers:

1. General Requirements for Manufactured Pipe Markers: Provide preprinted, color-coded, precoiled or self-adhesive pipe markers.

2. Pretensioned Pipe Markers: Precoiled, semirigid plastic formed to cover full circumference of pipe and to attach to pipe without fasteners or adhesive.

3. Self-Adhesive Pipe Markers: Printed plastic with contact-type, permanent-adhesive backing.

4. Pipe Markers Contents: Include identification of piping service using industry best practice terminology such as “fire protection” and “dry standpipe”:

a. Application: Supply, feed and crossmain pipes 2-1/2 inches and larger.

b. Lettering Size: At least 1-1/2 inches high.

c. Pipe Label Color Schedule:

1) Fire Suppression Piping:

a) Background Color: Red.

b) Letter Color: White.

B. Pipe, Tube and Fittings:

1. Refer to water-based fire suppression systems and clean agent fire suppression specifications for pipe, tube, and fitting materials and joining methods.

2. Pipe Threads: ASME B1.20.1 for factory-threaded pipe and pipe fittings.

C. Joining Material:

1. For special joining materials not listed below refer to water-based fire suppression systems and clean agent suppression system specifications..

2. Pipe-Flange Gasket Materials: ASME B16.21, nonmetallic, flat, asbestos-free, 1/8-inch maximum thickness unless thickness or specific material is indicated.

3. Solder Filler Metals: ASTM B32, lead-free alloys. Include water-flushable flux according to ASTM B813.

4. Brazing Filler Metals: AWS A5.8, BCuP Series or BAg1, unless otherwise indicated.

5. Welding Filler Metals: Comply with AWS D10.12M/D10.12.

D. Mechanical Sleeve Seals:

1. Description: Modular sealing element unit, designed for field assembly, to fill annular space between pipe and sleeve.

2. Sealing Elements: EPDM interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.

3. Pressure Plates: Stainless steel. Include two (2) for each sealing element.

4. Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements. Include one for each sealing element.

5. See Section 21 05 17 – Sleeves and Sleeve Seals for Fire Piping for additional requirements.

E. Sleeves:

1. Galvanized-Steel Sheet: 0.0239-inch minimum thickness; round tube closed with welded longitudinal joint.

2. Steel Pipe: ASTM A53/A53M, Type E, Grade B, Schedule 40, galvanized, plain ends.

3. Cast Iron: Cast or fabricated "wall pipe" equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop, unless otherwise indicated.

4. Stack Sleeve Fittings: Manufactured, cast-iron sleeve with integral clamping flange. Include clamping ring and bolts and nuts for membrane flashing:

a. Underdeck Clamp: Clamping ring with set screws.

5. See Section 21 05 17 – Sleeves and Sleeve Seals for Fire Piping for additional requirements.

F. Escutcheons

1. Description: Manufactured wall and ceiling escutcheons and floor plates, with an ID to closely fit around pipe, tube, and insulation of insulated piping and an OD that completely covers opening.

2. One-Piece, Deep-Pattern Type: Deep-drawn, box-shaped brass with polished chrome-plated finish.

3. One-Piece, Cast-Brass Type: With set screw:

   a. Finish: Polished chrome plated.

4. Split-Casting, Cast-Brass Type: With concealed hinge and set screw:

   a. Finish: Polished chrome plated.

G. Grout:

1. Description: ASTM C1107/C1107M, Grade B, non-shrink and nonmetallic, dry hydraulic-cement grout:

   a. Characteristics: Post-hardening, volume-adjusting, nonstaining, noncorrosive, nongaseous, and recommended for interior and exterior applications.

   b. Design Mix: 5000 pounds per square inch, 28-day compressive strength.

   c. Packaging: Premixed and factory packaged.

2. See Section 21 05 17 – Sleeves and Sleeve Seals for Fire Piping for additional requirements.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Cooperation with Other Trades:

1. Give full cooperation to other trades and furnish in writing to other trades, with copies to the Resident Engineer, any information necessary to permit the work of all trades to be installed satisfactorily and with the least possible interference or delay.

2. Where Fire Protection work will be installed close to, or interfere with other trades' work, coordinate with other trades to make a satisfactory adjustment. If work is installed before coordinating with other trades, or if it causes any interference with work of other trades, make the necessary changes in the work to correct the conditions.

3. Furnish to other trades necessary templates, patterns, setting drawings and shop details for the proper installation of work and for coordinating adjacent work. This includes participation and support of any Building Information Modeling efforts associated with this contract.

B. Piping Systems:

1. Contract Drawing, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.

2. Install piping in concealed locations, unless otherwise indicated and except in equipment rooms and service areas.

3. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

4. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

5. Install piping to permit valve servicing.

6. Install piping at indicated slopes.

7. Install piping free of sags and bends.

8. Install piping for dry-pipe and preaction systems to fully drain and not trap water at expansion joints.

9. Install fittings for changes in direction and branch connections.

10. Install piping to allow application of insulation, when applicable.

11. Select system components with pressure rating equal to or greater than system operating pressure.

12. Install escutcheons for penetrations of finished walls, ceilings, and floors.

13. Install sleeves for pipes passing through concrete and masonry walls, gypsum board partitions, and concrete floor and roof slabs.

14. Aboveground, Exterior-Wall Pipe Penetrations: Seal penetrations using sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals:

    a. Install steel pipe for sleeves smaller than 6 inches in diameter.

    b. Install cast-iron "wall pipes" for sleeves 6 inches and larger in diameter.

    c. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

15. Underground, Exterior-Wall Pipe Penetrations: Install cast-iron "wall pipes" for sleeves. Seal pipe penetrations using mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals:

a. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

16. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials and systems as required by the Contact.

17. Install floor plates for piping penetrations of equipment-room floors. Install floor plates with ID to closely fit around pipe, tube, and insulation of piping and with OD that completely covers opening.

18. Verify final equipment locations for roughing-in.

19. Install flexible expansion joints where indicated on drawings and where piping crosses building seismic joints. Install vertical support hanger within 4 pipe diameters on each side of the flexible joints and seismic joint. Brace each hanger longitudinally and transversely. Install vertical support at 180-degree return bend.

C. Equipment:

1. Install equipment to allow maximum headroom unless specific mounting heights are not indicated.

2. Install equipment level (pitched for dry-pipe and preaction systems to drain) and plumb, parallel and perpendicular to other building systems and components in exposed interior spaces, unless otherwise indicated.

3. Install fire suppression equipment to facilitate service, maintenance, and repair or replacement of components. Connect equipment for ease of disconnecting, with minimum interference to other installations. Extend grease fittings to accessible locations.

4. Install equipment to allow right of way for piping installed at required slope.

D. Padlock and Chain System at Standpipe Isolation Valves:

1. For standpipe isolation valves not wired for tamper switches, provide chain and breakaway padlock at each valve.

2. Valves must be locked in the open position unless otherwise indicated in the drawings.

3. Padlocks must be keyed to ST standard: Master Model 500KABRKLH, UNSPSC 46171501.

4. Chain must be secured tightly around the standpipe so that chain does not hang loose. Padlock must be located to be fully accessible.

E. Construction:

1. Join pipe and fittings according to the following requirements.

2. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

3. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly:

a. Threaded Joints: Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:

1) Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.

2) Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged.

4. Soldered Joints: Apply water-flushable flux, unless otherwise indicated, to tube end. Construct joints using lead-free solder alloy.

5. Brazed Joints: Construct joints using copper-phosphorus brazing filler metal.

6. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:

a. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.

b. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged.

c. Damaged Threads: Do not use pipe sections that have cracked or open welds.

7. Welded Joints: Refer to water-based fire suppression and clean agent fire suppression systems for welded joints.

8. Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.

F. Pipe Connections: Make connections according to the following, unless otherwise indicated:

1. Wet Piping Systems: Install dielectric coupling and nipple fittings to connect piping materials of dissimilar metals.

2. Underground, Exterior-Wall Penetrations: Install dielectric couplings and isolate flange gaskets for all underground piping connections the above piping. Coordinate locations and installation with corrosion control systems.

G. Concrete Bases:

1. Anchor equipment to concrete base according to equipment manufacturer’s written instructions and according to Authority having Jurisdiction and Concrete Division 03 Anchorage to Concrete Specifications.

a. Construct concrete bases of dimensions indicated, but not less than 4 inches larger in both directions than supported unit with chamfer edges.

b. Install dowel rods to connect concrete base to concrete floor as shown on Issued for Construction structural drawings.

c. Install Type 304 stainless steel expansion anchors for supported equipment that extends through concrete base, and anchor into structural concrete floor. Provide dielectric insulation between dissimilar metals.

d. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.

e. Install anchor bolts to elevations required for proper attachment to supported equipment.

f. Install anchor bolts according to anchor-bolt manufacturer's written instructions.

g. Use minimum 4,000-psi, 28-day compressive-strength concrete.

h. Coordinate locations and installation with corrosion control systems.

3.02 PREPARATION FOR IDENTIFICATION INSTALLATION

A. Clean piping and equipment surface of substances that could impair bond of identification devices, including dirt, oil, grease, release agents, and incompatible primers, paints, and encapsulants.

B. Coordinate installation with piping painting, insulation and heat trace installation as required.

3.03 IDENTIFICATION

A. Equipment Signage/Label Installation

1. See Section 21 11 00 - Water-Based Fire Suppression Systems for fire sign and label requirements for water-based fire suppression systems.

2. Install or permanently fasten labels on each major item of fire suppression equipment.

3. Locate equipment labels where accessible and visible.

4. For clean agent and other fire protection systems provide warning signs, equipment signs and labels in accordance with the International Fire Code, NFPA 2001, and other applicable standards:

a. All signage and labels must be secured with fasteners, adhesive, or other approved means as outlined in this specification.

b. All signs exposed to moisture, varying temperatures and sunlight must be designed to perform in the environment.

c. Valve/Equipment Labels:

5. Label Content:

a. Include equipment's Contract Drawing designation or unique equipment number, Contract Drawing numbers where equipment is indicated (plans, details, and schedules).

b. Information indicating the type of valve or equipment, and area served, when fire department interface is expected and when required by codes and standards.

6. Material and Thickness: Multilayer, multicolor, phenolic engraved white lettering on red background, 1/8 inch thick, and having predrilled holes for attachment hardware if the label is to be mounted with fasteners.

7. Identification: Provide the unique identifying number complying with Sound Transit standards and requirements.

8. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 inches by 3/4 inch.

9. Minimum Letter Size: 1 inch and proportionately larger lettering for greater viewing distances. Include secondary lettering (e.g. identification number) two-thirds to three-fourths the size of principal lettering.

10. Fasteners: Stainless-steel rivets or stainless-steel self-tapping screws.

11. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.

B. Pipe Marker Installation:

1. Locate pipe marker where piping is exposed or above accessible ceilings in finished spaces; machine rooms; accessible maintenance spaces such as shafts, tunnels, and plenums; and exterior exposed locations as follows:
   a. Near each valve and device.
   b. Near each branch connection, excluding short takeoffs for sprinklers.
   c. Near penetrations through walls, floors, ceilings, and inaccessible enclosures.
   d. At access doors, manholes, and similar access points that permit view of concealed piping.
   e. Near major equipment items and other points of origination and termination.
   f. Spaced at maximum intervals of 50 feet along each run. Reduce intervals to 25 feet in areas of congested piping and equipment.
   g. On piping above removable acoustical ceilings. Omit intermediately spaced labels.

3.04 CLEANING

A. Promptly remove waste material and rubbish caused by the work. At the Completion of the work, clean the dirt and debris from the fire suppression installation, including equipment, and piping.

END OF SECTION

SECTION 21 05 17

SLEEVES AND SLEEVE SEALS FOR FIRE PIPING

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Requirements for the following:

a. Sleeves.

b. Stack-sleeve fittings.

c. Sleeve-seal systems.

d. Sleeve-seal fittings.

e. Grout.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

2. ASTM International (ASTM):

a. ASTM A53.

b. ASTM E84/E814.

c. ASTM A377.

d. ASTM A-653.

e. ASTM A-888.

f. ASTM C1107.

3. Underwriter Laboratories (UL):

a. UL (FRD) – Fire Resistance Directory.

1.03 SUBMITTALS

A. Transmit:

1. Product Data: For each type of product indicated (Submittals shall be reviewed by Plumbing and Structural DOR for applicability.)

PART 2 - PRODUCTS

2.01 MATERIALS

A. Sleeves:

1. Cast-Iron Wall Pipe Sleeves: ASTM A377, Cast or fabricated of cast or ductile iron and equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop unless otherwise indicated.

2. Cast Iron Pipe sleeves: ASTM A-888 Cast Iron pipe with plain ends.

3. Galvanized-Steel Wall Pipes: ASTM A 53/A 53M, Schedule 40, with plain ends and welded steel collar; zinc coated or equal corrosion inhibitor coating as approved by the Resident Engineer.

4. Galvanized-Steel-Pipe Sleeves: ASTM A53/A 53M, Type E, Grade B, Schedule 40, zinc coated, with plain ends.

5. Galvanized-Steel-Sheet Sleeves: ASTM A653, 0.0239-inch minimum thickness; round tube closed with welded longitudinal joint.

B. Grout:

1. Standard: ASTM C 1107/C 1107M, Grade B, post-hardening and volume-adjusting, dry, hydraulic-cement grout.

2. Characteristics: Nonshrink productrecommended by the manufacturer for interior and exterior use, as applicable.

3. Design Mix: 5000-psi, 28-day compressive strength.

4. Packaging: Premixed and factory packaged.

2.02 MANUFACTURED PRODUCTS

A. Stack-Sleeve Fittings:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. Jay R. Smith Mfg. Co.

b. Wade.

c. Zurn.

2. Description: Manufactured, cast-iron sleeve with integral clamping flange. Include clamping ring, bolts, and nuts for membrane flashing:

a. Underdeck Clamp: Clamping ring with setscrews.

B. Sleeve-Seal Systems:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. Advance Products & Systems, Inc.

b. CALPICO, Inc.

c. The Metraflex Company.

d. Pipeline Seal and Insulator, Inc.

e. Link-Seal - GPT an EnPro Industires, Inc.

2. Description: Modular sealing-element unit, designed for field assembly, for filling annular space between piping and sleeve:

a. An assembly consisting of a stainless steel frame, a compression mechanism, and insert modules for pipe, duct, and tubing.

b. Comply with F- and T-ratings as required by local codes, code official, and as tested in accordance with ASTM E814 or UL1479.

c. Sealing Elements: EPDM-rubber interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.

d. Designs must be water and gas tight to 14.5 psi:

1) Seals shall be asbestos free, lead free, halogen free.

2) Pressure Plates: Stainless steel.

3) Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements.

C. Sleeve-Seal Fittings:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. HoldRite.

b. The Metraflex Company.

c. Pipeline Seal and Insulator, Inc.

2. Description: Manufactured plastic, sleeve-type, waterstop assembly made for imbedding in concrete slab or wall. Unit has plastic or rubber waterstop collar with center opening to match piping OD.

PART 3 - EXECUTION

3.01 SLEEVE INSTALLATION

A. Install sleeves for piping passing through penetrations in floors, partitions, roofs, and walls. Provide appropriate waterproofing when penetrating exterior envelope.

B. For sleeves that will have sleeve-seal system installed, select sleeves of size large enough to provide 1-inch annular clear space between piping and concrete slabs and walls. Sleeves shall be two inches larger than proposed pipe diameter:

1. Sleeves are not required for core-drilled holes.

C. Install sleeves in concrete floors, concrete roof slabs, and concrete walls as new slabs and walls are constructed.

1. Permanent sleeves are not required for holes in slabs formed by molded-PE or -PP sleeves.

2. Cut sleeves to length for mounting flush with both surfaces:

a. Exception: Extend sleeves installed in floors of mechanical equipment areas or other wet areas 2 inches above finished floor level.

3. Using grout, seal the space outside of sleeves in slabs and walls without sleeve-seal system.

D. Install sleeves for pipes passing through interior partitions:

1. Cut sleeves to length for mounting flush with both surfaces.

2. Install sleeves that are large enough to provide 1/4-inch annular clear space between sleeve and pipe or pipe insulation.

3. Seal annular space between sleeve and piping or piping insulation; use joint sealants appropriate for size, depth, and location of joint. Comply with applicable codes and standards requirements for joint sealants.

E. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials and systems as required by the Contract. Comply with applicable codes and standards requirements for firestopping.

3.02 STACK-SLEEVE-FITTING INSTALLATION

A. Install stack-sleeve fittings in new slabs as slabs are constructed:

1. Install fittings that are large enough to provide 1/4-inch annular clear space between sleeve and pipe or pipe insulation.

2. Secure flashing between clamping flanges for pipes penetrating floors with membrane waterproofing. Comply with requirements applicable codes and standard for flashing.

3. Install section of pipe to extend sleeve to 2 inches above finished floor level.

4. Extend sleeve fittings below floor slab as required to secure clamping ring if ring is specified.

5. Using grout, seal the space around outside of stack-sleeve fittings.

B. Fire-Barrier Penetrations: Maintain indicated fire rating of floors at pipe penetrations. Seal pipe penetrations with firestop materials and systems as required by the Contract. Comply with applicable codes and standards requirements for firestopping.

3.03 SLEEVE-SEAL-SYSTEM INSTALLATION

A. Install sleeve-seal systems in sleeves in exterior concrete walls above and below grade and slabs-on-grade at service piping entries into building.

B. Select type, size, and number of sealing elements required for piping material and size and for sleeve ID or hole size. Position piping in center of sleeve. Center piping in penetration, assemble sleeve-seal system components, and install in annular space between piping and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make a watertight seal.

C. Fire-Barrier Penetrations: Maintain indicated fire rating of wall, floor at pipe penetrations. Seal pipe penetrations with firestop materials as required by the Contract. Comply with applicable codes and standards requirements for firestopping.

3.04 SLEEVE-SEAL-FITTING INSTALLATION

A. Install sleeve-seal fittings in new walls and slabs as they are constructed.

B. Assemble fitting components of length to be flush with both surfaces of concrete slabs and walls. Position waterstop flange to be centered in concrete slab or wall.

C. Secure nailing flanges to concrete forms.

D. Using grout, seal the space around outside of sleeve-seal fittings.

E. Fire-Barrier Penetrations: Maintain indicated fire rating of wall, floor at pipe penetrations. Seal pipe penetrations with firestop materials and systems as required by the Contract. Comply with applicable codes and standards requirements for firestopping.

3.05 SLEEVE AND SLEEVE-SEAL SCHEDULE

A. Use sleeves and sleeve seals for the following piping-penetration applications:

1. Concrete structural elements (Not covered elsewhere in sleeve and sleeve-seal schedule):

    a. Piping Smaller Than NPS 6: Cast Iron pipe sleeves.

    b. Piping NPS 6 and Larger: Cast Iron pipe sleeves.

2. Exterior Concrete Walls above Grade:

    a. Piping Smaller Than NPS 6: Cast-iron wall pipe sleeves with sleeve-seal system:

        1) Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve seal system.

    b. Piping NPS 6 and Larger: Cast-iron wall pipe sleeves-seal system:

        1) Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve seal system.

3. Exterior Concrete Walls below Grade:

    a. Piping Smaller Than NPS 6: Cast-iron wall pipe sleeves with sleeve-seal system:

        1) Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve-seal system.

    b. Piping NPS 6 and Larger: Cast-iron wall pipe sleeves with sleeve-seal system:

        1) Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve-seal system.

4. Concrete Slabs-on-Grade:

    a. Piping Smaller Than NPS 6: Cast-iron wall pipe sleeves with sleeve-seal system:

        1) Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve-seal system.

b. Piping NPS 6 and Larger: Cast-iron wall pipe sleeves with sleeve-seal system:

1) Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve-seal system.

5. Concrete Slabs above Grade:

a. Piping Smaller Than NPS 6: Galvanized-steel-pipe sleeves Stack-sleeve fittings.

b. Piping NPS 6 and Larger: Galvanized-steel-pipe sleeves Stack-sleeve fittings.

6. Interior Partitions:

a. Piping Smaller Than NPS 6: Galvanized-steel-pipe sleeves.

b. Piping NPS 6 and Larger: Galvanized-steel-sheet sleeves.

END OF SECTION

SECTION 21 08 00

COMMISSIONING OF FIRE SUPPRESSION

NOTE TO DESIGNER:

SECTIONS WITH BRACKETS. E.G., [TEXT] ARE TO BE MODIFIED OR DELETED IF NOT APPLICABLE. ITALICIZED TEXT PROVIDES INSTRUCTION TO THE DESIGNER TO INCLUDE LANGUAGE ON SPECIFIC TOPICS WHEN APPLICABLE. THE INSTRUCTIONS ARE TO BE DELETED WHEN THE SPECIFICATION IS FINALIZED. LANGUAGE NOT IN BRACKETS IS TO BE USED ‘AS IS’ WITHOUT MODIFICATION OR WITH AN APPROVED SPECIFICATION MODIFICATION REQUEST.

DESIGNER TO DELETE TEXT ABOVE FOR FINAL SECTION

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Requirements for commissioning process requirements for includes automatic sprinkler systems, standpipe systems, fire suppression related heat tracing/insulation, clean agent suppression systems including releasing systems, pre-action sprinkler systems, fire extinguishers, and fire pumps:}:

a. Level 1 commissioning activities for Fire Suppression.

b. Level 2 commissioning activities for Fire Suppression.

c. [Support for Level 3 commissioning activities related to Fire Suppression].

d. [Support for Level 4 commissioning activities related to Fire Suppression].

[Designer: Level 3 and 4 commissioning activities are not included in this standard specification and need to be added if any tests are necessary.]

B. Definitions

1. See general commissioning requirements (Section 01 91 13 – General Systems Testing and Commissioning Requirements).

2. Command: When used in the description of a commissioning activity, command means to use the station human machine interface (HMI) for the building management system (BMS) to control systems, equipment, and components.

3. Systems, Equipment, and Components: Where these terms are used together or separately, they mean "as-built" systems, equipment, and components.

4. Human Machine Interface (HMI): Equipment, software, and functional programming at the locations shown on the Plans and as specified in the requirements of field control system as required in the Contract.

1.02 COORDINATION

A. See general commissioning requirements (Section 01 91-13 – General Systems Testing and Commissioning Requirements) for general coordination requirements related to commissioning. Some Level 1 and all Level 2 activities require coordination with other trades.

B. Tests observed by the AHJ (e.g., fire department) may be conducted concurrently but pre-testing must be performed to ensure the system is ready and will pass inspection.

1.03 COMMISSIONING ACTIVITIES

A. Commissioning work includes: Work furnishes labor and material to accomplish building commissioning to comply with the general commissioning requirements as required by the Contact and this specification, including:

1. Provide to the Testing and Commissioning Manager preliminary O&M information for use in developing commissioning test procedures.

2. Testing and Commissioning Manager Develop commissioning activity checklists, procedures and data forms submittals for work specified in this Section.

3. Provide information to the Testing and Commissioning Manager needed for control interface wiring diagrams submittals for the work of this Section.

4. Perform Level 1 commissioning activities specified in this Section, including installation verification, static tests, start-up, component tests, equipment tests, systems tests.

5. Perform Level 2 commissioning activities specified in this Section, including intra-station system interface tests.

6. Provide support for Level 3 commissioning activities, including jointly with the communications system contractor field testing points in the interface terminal strips, being present during level 3 testing with adequate labor and support personnel to adjust equipment and troubleshoot system failures that might arise. When material or equipment provided by this Division is found to conflict with specified criteria, adjust or replace said material or equipment, with the assistance of manufacturer as needed.

7. Provide support for Level 4 commissioning activities, including providing adequate labor and support personnel to adjust equipment and troubleshoot system failures that might arise during pre-revenue testing.

8. Operate equipment and system during commissioning activities as required by the Testing and Commissioning Manager.

9. Perform and document commissioning tests to verify readiness for commissioning test demonstration. Commissioning tests are specified un this specification.

10. Correct issues and repeat commissioning tests when results do not meet acceptance criteria.

11. Commissioning Test Demonstrations: General requirements for commissioning test demonstrations must comply with the general commissioning requirements,

Level 1 and Level 2 commissioning activity commissioning test demonstrations as required by the Contract:

a. Repeat commissioning tests on a sample basis to demonstrate acceptable performance: Level 1 Component, Equipment, and System Commissioning Tests, and for Level 2 Intra-station system interface tests.

b. Record and submit commissioning test demonstration data and issues.

c. Correct issues and repeat commissioning test demonstration when results do not meet Acceptance Criteria.

12. Attend commissioning meetings as requested by the Testing and Commissioning Manager.

13. Report any inconsistencies or issues in system operations or performance.

14. If a commissioning test demonstration fails, assist in determining the cause of failure. Make corrections, as necessary.

B. Support the Testing and Commissioning Manager to accomplish commissioning work on schedule and in coordination with other trades.

1.04 QUALITY ASSURANCE

A. Coordinate completion of Install Verification forms, by the Quality Control Inspector, as identified in the Contractors Quality Control Inspection and Test Plan.

PART 2 - PRODUCTS

2.01 TEST EQUIPMENT

A. Provide test equipment and instrumentation, including consumable supplies, required to execute commissioning activities. Unless noted otherwise, test equipment and instrumentation remain the property of the Contractor.

B. Provide proof of calibration of test equipment. Test equipment must be calibrated within one (1) year of use. A sticker from the calibration laboratory must be affixed to the test equipment indicating date of calibration.

C. Provide proprietary test instruments or tools required by the equipment manufacturer. Provide and operate the proprietary test instruments or tools as required for commissioning work.

PART 3 - EXECUTION

3.01 LEVEL 1 AND 2 COMMISSIONING ACTIVITIES REQUIREMENTS

A. Technical requirements for commissioning of Fire Suppression are included in this specification.

B. Provide technicians, instrumentation, and tools to perform commissioning activities in accordance with accepted commissioning activity procedures at the direction of the Testing and Commissioning Manager.

C. Scope of Fire Suppression commissioning activities applies to all portions of the Fire Suppression installation described in the test.

D. Upon approval of product submittals associated with the technical requirements and the scope of Commissioning develop and submit for approval Install Verification Checklist forms for the quality criteria of this specification.

E. Preparation:

1. Certify that Fire Suppression, subsystems, and equipment have been completed, calibrated, and started; and are operating in accordance with Contract Documents.

2. Testing Instrumentation: Install measuring instruments and logging devices to record test data in accordance with accepted commissioning test procedures as directed by the Testing and Commissioning Manager.

3. Certify that Fire Suppression instrumentation and control systems are completed and calibrated; operating according to the Contract Documents; and that pretest set points are recorded.

4. Set systems, subsystems, and equipment into operating mode to be tested (e.g., normal shut down, normal auto position, normal manual position, unoccupied cycle, emergency power, and alarm conditions) in accordance with accepted commissioning test procedures as directed by the Testing and Commissioning Manager.

F. Coordinate with GC and other parties for testing alarms and for safe discharge of water to ensure job site safety, prevent damage to landscape, and prevent debris from obstructing drains. Test all operating modes, interlocks, control responses, responses to abnormal or emergency conditions, and verify proper response of building automation system controllers and sensors.

G. Perform tests using design conditions whenever possible.

H. Simulated conditions may need to be imposed using an artificial load when it is not practical to test under design conditions. Provide equipment to simulate loads. Set simulated conditions in accordance with accepted commissioning test procedures as directed by the Testing and Commissioning Manager. Document simulated conditions and methods of simulation. After tests, return settings to normal operating conditions.

I. Request approval to alter set points when simulating conditions is not practical.

J. Request approval to alter sensor values with a signal generator when design or simulating conditions and altering set points are not practical.

K. If tests cannot be completed because of a deficiency outside the scope of the Fire Suppression system, document the deficiency and report it to Sound Transit. After deficiencies are resolved, reschedule tests.

L. Where seasonal testing is specified, complete appropriate initial commissioning tests and documentation within the Construction Period. Schedule and execute seasonal tests when specified conditions are expected.

M. Commissioning documents must include testing requirements as required by the Contract, adopted codes and standards and the criteria outlined in this specification.

3.02 LEVEL 1 AND LEVEL 2 COMMISSIONING ACTIVITY PROCEDURES

A. Submit a single (combined) commissioning document (checklists, procedures, forms) for all Level 1 commissioning activities as outlined below for each system type for review and approval as outlined in Section 01 91-13 – General Systems Testing and Commissioning Requirements. The document must be broken up into sections with each activity a separate section with a specific sub header. Completed sections for each activity group (IV, ST, SU, C, E and S) must be submitted upon completion:

1. Level 1 commissioning activities:

    a. Installation verification (IV).

    b. Static tests (ST).

    c. Start-up procedures (SU).

    d. Component tests (C).

    e. Equipment tests (E).

    f. System tests (S).

2. Level 1 system types include:

    a. Automatic sprinkler systems (wet, dry, preaction) including compressors,

    b. [Guideway standpipe systems (manual dry and semiautomatic)].

    c. Building/station standpipe system (manual wet and manual dry).

    d. [Fire suppression system heat tracing/insulation].

    e. [Clean agent detection system].

    f. Fire extinguishers.

    g. [Fire pumps].

3. Level 2 commissioning activities:

    a. Clean Agent System smoke dampers Control.

    b. Clean Agent System HVAC Interface via BMS.

    c. [Clean Agent Communication with FAS].

    d. Sprinkler system waterflow and tamper interface with FAS.

    e. [Fire Pump Interface with FAS].

    f. [Control of tunnel deluge valves via FAS].

    g. [Other Intra-station system interface tests].

3.03 LEVEL 1 INSTALLATION VERIFICATION CHECKLIST REQUIREMENTS

A. Installation verification checklist forms must include the following:

1. Organization to prompt the installer to check off quality criteria for each discrete portion of the Work.

2. Identify the location and commissioning activity number at the top of the form.

3. Section for verification of delivery of accepted materials

4. Section for condition of materials at delivery

5. Section for description of installation steps. Include manufacturer's installation instructions.

6. Space at the end of the form for the installer to print their name and company name, fill in the date, and sign or initial.

7. Space at the end of the form for the Quality Control inspector designated for the scope to review and accept installation verification. QC Inspector must perform Install Verification and verify each element identified in form has been reviewed for conformance with contract documents and in accordance with the Contractors Quality Control Inspection and Test Plan as part of Section 01 45 00 – Quality Assurance / Quality Control.

8. Space to identify the area of work for which the installer is executing the Installation Verification Checklist

9. Description of the quality criteria as it pertains to the specific work. Include a checkbox for each criterion.

10. Example checklist/test form can be provided upon request.

B. Quality Criteria: Installation verification checklists must address the following quality criteria:

1. Record and ensure the equipment, wire, and cable make and model match accepted submittals.

2. Equipment is installed without visible damage.

3. Equipment is clean and free of debris.

4. Location is as indicated on drawings.

5. Equipment is accessible for maintenance using safe work practices.

6. There is sufficient space to remove and replace components intact without demolishing other work.

7. Installation in accordance with accepted shop drawings, pipeline layout drawings, support and seismic design submittal, manufacturers' requirements, and contract documents.

C. Fill out and sign installation verification checklists for Equipment while the Work is being installed. Fill out and sign the installation verification checklist as work proceeds to improve the quality of the installation. Retain completed installation verification checklists on site for review.

D. Before performing a commissioning test, installation verification checklists must be performed and completed by QC inspector designated for the appropriate area specified here in and within the Contractors Quality Control Inspection and Test Plan as part of Section 01 45 00 - Quality Assurance / Quality Control. Submit completed installation verification checklists for work included in the commissioning test.

3.04 LEVEL 1 INSTALLATION VERIFICATION

A. Installation verification checklists are required for the following, minimum:

1. 2108-IV-01 Heat Tracing for Fire Suppression, including:

   a. Heating cable installation, securement, termination.

   b. Heater trace circuit controller.

   c. Remote temperature sensor.

2. 2108-IV-02 Fire Suppression Systems Insulation, including:

   a. Insulation material installation.

   b. Sealants.

   c. Jackets.

   d. Securements.

   e. Tests and inspections in accordance with the requirements of fire suppression systems insulation as required by the Contract Documents.

3. 2108-IV-03 Water-Based Fire Suppression, including:

   a. Above and underground piping.

   b. Couplings.

   c. Mechanical fittings.

   d. Threaded fittings.

   e. Alarm test valve.

   f. Gate valves.

   g. Backflow preventer.

   h. Forward flow test outlets.

   i. Ball valves.

   j. Butterfly control valves.

   k. Isolation valves.

   l. Post indicator valve and tamper switch.

   m. Check valves.

   n. Dry-pipe valves/Wet-pipe riser assembly/Deluge valves.

   o. Compressors and air maintenance devices.

   p. Flow/Pressure/Tamper switches.

   q. Automatic drain valves.

r. Automatic air/vacuum valves.

s. Drain valves/Drum drips.

t. Air Vent valves/Pressure relief valves.

u. Seismic expansion joints.

v. Sprinkler heads.

w. Fire hose valves/Fire hose valve cabinets.

x. Fire department connections.

y. Anchors/Supports/Bracing.

4. 2108-IV-04 Clean Agent System, including:

a. Pipe and fittings.

b. Nozzles.

c. Agent release valves.

d. Extinguishing agent containers and bracing.

e. Discharge nozzles.

f. Control/releasing panels.

g. Detection devices.

h. System wire/cable including interface wiring.

i. Manual stations.

j. Abort switches.

k. Maintenance bypass Switches.

l. Notification devices.

m. Electrical power wiring and circuit breaker.

5. [2108-IV-05 Fire Pump]:

a. [Piping and fittings].

b. [Fire pump].

c. [Jockey pump].

d. [Driver].

e. [Pressure relief Valve].

f. [Controller and associated wire/conduit].

g. [Test header].

h. [Gages].

i. [Valves].

j. [Other key components as outlined in NFPA 20].

6. 2108-IV-06 Fire Extinguisher Cabinets/Hangers:

a. Cabinets.

b. Sheetrock for fire rated framed wall recessed mounting.

c. Signage.

d. Hangers for surface mounted units.

3.05 LEVEL 1 STATIC TESTS

A. 2108-ST-01: Flushing of Piping:

1. System/Equipment to be Tested:

a. Underground mains and lead in connections to automatic sprinkler systems.

b. Underground portion of Standpipes systems.

2. Functions to be Tested:

a. Clean pipe - flushing debris from piping.

3. Conditions of the Test:

a. Flush as outlined in NFPA 24.

4. Acceptable Results:

a. Flush until discharge water is clean.

b. Provide completed Contractor’s material and test certificate.

B. 2108-ST-02: Hydrostatic Test:

1. System/Equipment to be tested:

a. Underground mains and lead in connections to automatic sprinkler systems.

b. Standpipes Systems.

c. Sprinkler system piping; wet, dry and pre-action.

d. Other systems as required by the contract and code.

2. Functions to be tested:

a. Pipe water leakage.

3. Conditions of the Test:

a. As outlined in NFPA 13 and NFPA 14.

4. Acceptable Results:

a. As outlined in NFPA 13 and NFPA 14.

b. Provide completed Contractor’s material and test certificate.

C. 2108-ST-03: Air Pressure Leakage Test:

1. System/Equipment to be Tested:

a. Sprinkler system piping; dry-pipe and pre-action systems,

2. Functions to be Tested:

a. Pipe air leakage.

3. Conditions of the Test:

a. As outlined in NFPA 13 and NFPA 2001.

4. Acceptable Results:

a. As outlined in NFPA 13 and NFPA 2001.

D. 2108-ST-04: Clean Agent Room Enclosure Leakage Test:

1. System/Equipment to be Tested:

a. Hazard area enclosure for clean agent fire protection zones.

2. Functions to be Tested:

a. Enclosure integrity using door pressurization fan and associated equipment.

3. Conditions of the Test:

a. Facility is substantially complete, firestopping systems complete, fire smoke dampers complete and closed, HVAC system serving the room is not operating.

b. Pressurize room using door fan and determine room leakage area.

4. Acceptable Results:

a. Equivalent leakage area as determined through testing is less than the allowable leakage area determined by the clean agent contractor as outlined in NFPA 2001.

E. 2108-ST-05: Clean Agent Piping/Manifold Leakage Test:

1. System/Equipment to be Tested:

a. Clean agent fire extinguishing system piping and manifold.

2. Functions to be Tested:

a. System integrity.

3. Conditions of the Test:

a. As required by NFPA 2001.

4. Acceptable Results:

    a. Leakage test passes meeting requirements of NFPA 2001.

F. 2108-ST-06: Clean Agent Piping Flow Test:

1. System/Equipment to be Tested:

    a. Clean agent fire extinguishing system piping, manifold, and nozzle.

2. Functions to be Tested:

    a. Unobstructed piping.

3. Conditions of the Test:

    a. Use Nitrogen or other inter gas as outlined in NFPA 2001.

4. Acceptable Results:

    a. Visual indication of airflow at every nozzle meeting the requirements of NFPA 2001.

3.06 LEVEL 1 START-UP

A. 2108-SU-01: Automatic Sprinkler System Main Drain Test:

1. System/Equipment to be Tested:

    a. Sprinkler system piping water supply and mains.

2. Functions to be Tested:

    a. Water flow volume using the main drain. For multiple systems served by a common manifold in a riser room testing one system that is hydraulically remote is permitted.

3. Conditions of the Test:

    a. Perform main drain test as outlined in NFPA 25.

    b. Record the pressure indicated by the supply water gauge.

    c. Fully open the main drain valve.

    d. After the flow has stabilized, record the residual (flowing) pressure indicated by the water supply gauge.

    e. Close the main drain valve slowly.

    f. Record the time taken for the supply water pressure to return to the original static (nonflowing) pressure.

4. Acceptable Results:

    a. Pressure drop during full flow is consistent with water supply information (which validates the supply main is not obstructed). Note, Per NFPA 25, investigate a drop that exceeds 10 percent of the static pressure,

    b. Water discharged to sanitary sewer without flooding the room/area.

B. 2108-SU-02: Standpipe Fill-Time Testing:

1. System/Equipment to be tested:

a. Guideway standpipe system (except tunnel system with automatic valves, see 2108-IS-06).

b. Air release vacuum valves.

c. Main and auxiliary drains.

d. Expansion joints.

e. Fire hose valves.

f. FDC.

2. Functions to be tested:

a. Fill time as outlined in NFPA 130.

b. Function of air release valves.

c. Function of expansion joints.

d. System integrity: ability to withstand forces and water hammer associated with rapid fill (design flow rate).

3. Conditions of the Test:

a. Fill system at design flow rate.

b. All isolation valves must be open.

c. All fire hose valves must be closed.

d. Pressurize system to design inlet pressure for water-based fire-suppression systems.

4. Acceptable Results:

a. Fill time meets contract and code requirements (10 minutes unless amended by the AHJ).

b. Air release valve seal when system is full.

c. System supports and braces perform as intended.

d. Expansions joint do not leak, move out of alignment, or show some other form of failure.

e. As required by NFPA 130 and NFPA 14 and as stated in the water-based fire-suppression systems specifications and Issued for Construction drawings.

C. 2108-SU-03: Standpipe Flow Testing:

1. System/Equipment to be tested:

a. Guideway standpipe systems and other standpipe systems when required by the AHJ.

b. Air release vacuum valves.

c. Main and auxiliary drains.

d. Expansion joints.

e. Fire hose valves.

f. FDC.

2. Functions to be tested:

a. Pumping pressure and flow volume aligns with hydraulic calculation.

b. Inlet pressure matched FDC sign.

c. System integrity: Fire hose valves perform as intended.

3. Conditions of the Test:

a. Pump FDC to calculated inlet pressure.

b. The design number of remote fire hose valves are fully opened.

c. All isolation valves must be open.

d. Other requirements as required by the Contract Documents for water-based fire-suppression systems.

e. Water discharge is affectively managed, dechlorinated, and directed to storm drain, sanitary sewer, or other acceptable location.

4. Acceptable Results:

a. Inlet pressure aligns with hydraulic calculations and produces the calculated flow volume at remote fire hose valves.

b. Air release valve seal and remain sealed while flowing water.

c. System fully drains within 30 minutes from main and auxiliary drains.

d. Drain valves accessible without a lift.

e. System supports and braces perform as intended.

f. Expansions joint do not leak, move out of alignment, or show some other form of failure.

g. As required by NFPA 130 and NFPA 14 and as required by the Contract for water-based fire-suppression systems.

D. 2108-SU-04: Clean Agent Extinguishing Systems:

1. System/Equipment to be Tested:

a. Clean agent extinguishing systems.

2. Functions to be Tested:

a. Verify installation and perform startup of clean agent extinguishing systems in accordance with manufacturer's written installation, NFPA 2001, and startup procedures and as outlined in this specification.

b. All wiring installed and in compliance with submittals and shop drawings.

c. Panel power is dedicated with the correct circuit breaker.

d. Batteries are provided and the correct size and rating.

e. Interface wiring to dampers, doors, HVAC completed.

f. Agent storage container provided and braced.

g. Releasing valve provided but not yet attached to agent storage container.

3. Conditions of the Test:

a. Prerequisites: The following prerequisites must be successfully completed before start-up.

1) Complete level 1 static test 2108-ST-04, 2108-ST-05, and 2108-ST-06 with acceptable results.

b. Manufacturer-approved personnel must start-up clean agent extinguishing systems per manufacturer's written procedures. Record results on manufacturer's approved forms.

4. Acceptable Results:

a. Documented acceptable installation and startup in accordance with manufacturer's requirements and contract documents.

E. 2108-SU-05: Fire Pump:

1. System/Equipment to be tested:

a. Fire pump.

b. Jockey Pump.

c. Controller(s).

d. Piping, fittings, valves.

e. Pressure relief.

f. Power.

2. Functions to be tested:

a. Verify installation and perform startup of fire pump and controller in accordance with manufacturer's written installation, NFPA 20, and startup procedures and as outlined in this specification.

b. Confirm proper shaft rotation.

c. Vibration conforms to manufacturers' and NFPA 20 requirements.

d. Components on suction side of pump arranged and located in accordance with NFPA 20.

e. Verify location and drainage of the pressure relief valve.

f. Controller set to start pump start upon pressure drop.

g. Jockey pump start and stop pressure set.

h. Pump foundation and setting per NFPA 20.

i. Seismic bracing/anchors provided in accordance with design.

j. Automatic air release valve, circulating relief valve and pressure gages provided and properly located.

k. Test header provided (normally closed located in heated space).

l. Connection to driver alignment.

3. Conditions of the Test:

a. Pre-requisite: Lead in flushing and hydrostatic test.

b. Pre-requisite: Water-based fire suppression piping hydrostatic testing with acceptable results.

Pre-requisite: Pump connected to water supply.

c. Pre-requisite: Primary and standby power completed and commissioned for start-up (See 2608XX) as outlined in accordance with NFPA 20 and as required by the Contract.

4. Acceptable Results:

a. Conditions outlined above met, as required by NFPA 20, and as require in the Contract for water-based fire-suppression systems.

F. 2108-SU-06: Air Compressor

1. System/Equipment to be tested:

a. Air compressor.

b. Vibration isolation.

c. Pressure gages.

d. Air maintenance devices, check valves, piping.

e. Desiccant air driers and other specified accessories.

2. Functions to be tested:

a. Verify installation and perform startup of air compressor in accordance with manufacturer's written installation, NFPA 13, and startup procedures and as outlined in this specification.

b. Dry-pipe/preaction system air maintenance device set at pressure as outlined per NFPA 13.

c. Compressor controller start/stop pressure set.

d. Vibration isolation provided per manufacturers' instruction and they perform as intended.

3. Conditions of the Test:

a. Pre-requisite: Power and local disconnect completed and commissioned for start-up as outlined in accordance with NFPA 13, NFPA 70, and as required by the Contract.

b. Pre-requisite: Compressor provided with maintenance access as required by the manufacturer, NFPA 13, NFPA 70 and required in Issued for Construction Drawings.

4. Acceptable Results:

a. Conditions outlined above met, as required by NFPA 13, NFPA 70, and the Contract for water-based fire-suppression systems.

3.07 LEVEL 1 COMPONENT TESTS

A. 2108-C-04: Clean Agent Supervision of Circuits:

1. System/equipment to be tested:

a. Clean Agent Control Panels.

b. Clean agent extinguishing systems conductors for supervised circuits and associated initiating and notification devices, including:

1) Detection circuits.

2) Manual pull-station circuits.

3) Alarm circuits.

4) Release circuits.

5) Abort circuits.

6) Notification device circuits, including trouble lights and trouble alarms.

2. Functions to be tested:

a. Supervision of circuits and associated initiating and notification devices.

b. Confirm that a disconnected device on a circuit (Device in Alarm) does not inhibit reception of an alarm from another device on the same circuit.

c. Ground Faults.

3. Conditions of the test:

a. Disconnect each initiating device or notification appliance circuit to test for Supervision.

b. With one side of an initiating device disconnected, place another device on the same circuit in alarm.

c. Test for ground fault detection and operation by carefully grounding one side of each initiating and notification appliance circuit.

4. Acceptable Results:

a. Proper supervision of all initiating and notification circuits. An audible and visual trouble signal is received at the FACP.

b. Device in alarm on same circuit annunciates satisfactorily and initiates proper sequence at the FACP.

c. Appropriate alarm operation during ground alarm tests:

1) FACP tone device sounds.

2) FACP system Trouble LED lights.

3) FACP alphanumeric display indicates correctly.

3.08 LEVEL 1 EQUIPMENT TESTS

A. 2108-E-01: Heat Tracing Cable and Control:

1. System/equipment to be tested:

a. Self-Regulating, Parallel-Resistance Heating Cables.

b. Heater Trace Circuit Controller.

2. Functions to be tested:

a. Heat trace system installation and performance in accordance with NFPA 13 and manufacturer’s instructions.

b. Power supply dedicated with breaker sized in accordance with the manufacturer and as required by the Contract.

c. Controller location meets environmental conditions of manufacturer.

d. Cable continuity test.

e. Confirm connection to fire alarm for monitoring (intra system testing to follow).

f. Response to ambient temperature below freeze protection setpoint.

g. Heating cable fault alarm.

3. Conditions of the test:

a. Subject temperature sensor to temperature approximately 3 degrees Fahrenheit above freeze protection setpoint (initial setpoint 41 degrees Fahrenheit). Monitor sensed temperature with a calibration-grade thermometer. Gradually change setpoint or sensed temperature until freeze protection circuit is energized.

b. Subject temperature sensor to temperature approximately 3 degrees Fahrenheit below freeze protection setpoint (initial setpoint 41 degrees Fahrenheit). Monitor sensed temperature with a calibration-grade thermometer. Gradually change setpoint or sensed temperature until freeze protection circuit is de-energized.

c. Simulate an electrical fault on the heating cable.

4. Acceptance Criteria:

a. All function tests outlined above perform as intended.

b. Freeze protection circuit is energized at setpoint temperature minus 2 degrees Fahrenheit.

c. Freeze protection circuit is de-energized at setpoint temperature plus 2 degrees Fahrenheit.

d. Heater trace circuit controller initiates an alarm of cable fault.

B. 2108-E-02: Portable Fire Extinguishers:

1. System/equipment to be tested:

a. Portable fire extinguishers and accessories.

2. Functions to be tested:

a. Fire Extinguisher type and size in accordance with NFPA 10 and as required by the Contract.

b. Gage shows fully charged.

c. Installation service tag provided with installation date.

d. Located in cabinets or hung in accordance with NFPA 10 and as shown in Issued for Construction Drawings and as required by the Contract.

e. Conspicuously located and/or provided with signage.

3. Conditions of the test:

a. Units must be in place prior to substantial completion.

4. Acceptance Criteria:

a. All equipment requirement outlined above are met with acceptable results.

3.09 LEVEL 1 SYSTEM TESTS

A. 2108-S-01: Clean Agent Manual Station Response:

1. System/equipment to be tested:

a. Clean Agent Control Panels.

b. Manual Stations.

2. Functions to be tested:

a. System response to manual station actuation.

3. Conditions of the test: Perform test on complete, fully functional system, except actual discharge of extinguishing agent:

    a. Actuate manual station.

    b. Prerequisite: Level 1 IV, SU, and C clean agent system commissioning activities complete. Control panel is clear (no supervisor or trouble alarms).

4. Acceptance Criteria: For all conditions, HMI accurately reflects status of equipment and positions of devices.

    a. Immediate discharge of extinguishing agent upon actuation of manual station. Visual indication on annunciator panel, energize audible and visual alarms (fast pulse), activate EPO switch, activate contact closure to FACP for the following: shut down of air-conditioning and ventilating systems serving protected area, closure of HVAC fire/smoke dampers serving the protected area, closure of doors in protected area.

B. 2108-S-02: Clean Agent Detector Response:

1. System/equipment to be tested:

    a. Clean Agent Control Panels.

    b. Detectors.

    c. Abort Switch.

2. Functions to be tested:

    a. Sequence of control for first detector actuation.

    b. Sequence of control for second detector actuation.

    c. Abort switch delay of clean agent release.

    d. Interface to HVAC equipment and fire and smoke dampers.

    e. Keyed bypass switch.

    f. Agent container pressure switch.

3. Conditions of the test: Perform test on complete, fully functional system, except actual discharge of extinguishing agent:

    a. Prerequisite: Level 1 IV, SU, and C clean agent system commissioning activities complete. Control panel is clear (no supervisor or trouble alarms).

    b. Initiate an alarm at randomly selected detector.

    c. Initiate an alarm at a randomly selected detector in the other detection zone. Prior to termination of 30-second extinguishing agent discharge delay, press and hold abort switch for 15 seconds beyond termination of normal 30-second extinguishing agent discharge delay.

4. Acceptance Criteria: For all conditions, FACP and HMI accurately reflect status of equipment and positions of devices:

a. Actuating First Detector: Visual indication on annunciator panel, energize audible alarm and visual alarms (slow pulse), activate contact closure to FACP for the following: shut down of air-conditioning and ventilating systems serving protected area, closure of HVAC fire/smoke dampers serving the protected area, closure of doors in protected area.

b. Actuating Second Detector: Visual indication on annunciator panel, energize audible and visual alarms (fast pulse), activate EPO switch, start time delay for extinguishing-agent discharge for 30 seconds, and discharge extinguishing agent. Release of abort switch causes agent discharge. Extinguishing agent discharge operates audible alarms and strobe lights inside and outside the protected area.

c. HVAC equipment fans are turned off and control dampers are positioned as required to contain the clean agent system within the room enclosure with priority of controls over all other fan and damper control signals except the electrical disconnect switch. The fail position of the HVAC control dampers and fire and smoke dampers is such that it maintains containment of the enclosure.

d. Keyed bypass switch results in supervisory alarm and prevents activation of releasing valve.

e. Agent container low pressure switch.

C. 2108-S-03: Low Agent Pressure Switch:

1. System/equipment to be tested:

a. Low Agent Pressure Switch.

2. Functions to be tested:

a. Calibration.

b. Actuation.

3. Conditions of the test:

a. Prerequisite: Level 1 IV, SU, and C clean agent system commissioning activities complete. Control panel is clear (no supervisor or trouble alarms).

b. Apply test pressure to low agent pressure switch sensing port. Initial pressure: Greater than switch pressure set point. Gradually decrease pressure until switch changes state, indicating low pressure condition.

4. Acceptance Criteria: For all conditions, HMI accurately reflects status of equipment and positions of devices:

a. Switch changes state at set point plus/minus 5 percent. Initiates trouble alarm when pressure is less than pressure set point.

D. 2108-S-04 [Fire Pump Testing]:

1. [System/equipment to be tested:]

a. [Fire Pump].

b. [Jockey Pump].

c. [Controller].

d. [Test header].

e. [Water service].

2. [Functions to be tested:]

a. [Perform a full acceptance test in accordance with NFPA 20 including a full flow test using the test header, fire hoses and hose monster.]

3. [Conditions of the test:]

a. [Pump must be completed and connected to pump water supply.]

b. [Water must be discharge to the storm sewer with damaging landscaping or presenting a hazard.]

c. [Discharge water must be de-chlorinated.]

4. [Acceptable Results:]

a. [Fire pump performs as design and in accordance with NFPA 20.]

b. [Pump produces flow and pressure that meets or exceed nameplate and meets system demand.]

c. [Complete NFPA 20 Contractor's Material and Test Certificate for fire pump systems and a National Fire Sprinkler Association Fire Pump Test form, or equal as acceptable to the Specification owner.]

E. 2108-S-05 Dry-pipe system water delivery time:

1. System/equipment to be tested:

a. Dry-pipe systems.

2. Functions to be tested:

a. Trip test and water delivery time in accordance with NFPA 13.

3. Conditions of the test:

a. Prerequisites: All IV, ST, SU, C and E tests completed for dry-pipe systems and air compressors.

4. Acceptable Results:

a. Water delivery time meets the requirements of NFPA 13.

F. 2108-S-06 Air Compressor system refill of dry-pipe system:

1. System/equipment to be tested:

a. Air Compressor.

b. Dry-pipe systems.

2. Functions to be tested:

a. Compressor fill time for the largest dry-pipe system it serves.

3. [Conditions of the test:]

   a. Prerequisites: All IV, ST, SU, C and E tests completed for dry-pipe systems and air compressors.

4. [Acceptable Results:]

   a. Verify compressor refills the largest dry-pipe system it serves within the time allowed in NFPA 13.

3.10 LEVEL 2 INTRASYSTEM TESTS

A. 2108-IS-01 Clean agent system smoke damper control:

1. System/equipment to be tested:

   a. Smoke damper and fire smoke damper.

   b. Power relays.

2. Functions to be tested:

   a. Damper fully open when CAS is normal.

   b. Damper closely completely when CAS is in alarm in accordance with clean agent system sequence of operation.

   c. Damper closes completely when damper AC power to damper is switched off at dedicated circuit breaker.

      1) Confirm BMS damper position reflect damper position monitored via damper end switches. (See Section 23 08 00 – Commissioning of HVAC Systems).

3. Conditions of the test:

   a. Prerequisite: Damper Level 1 system activities complete.

   b. Prerequisite: Damper position may be verified directly via HVAC grille or access panel. (Visibility of actuator alone is not acceptable).

4. Acceptance Criteria:

   a. All functions perform as intended and as require by the applicable codes and standards and as requires in this specification and the Contract.

B. 2108-IS-02 Clean agent system HVAC interface via BMS:

1. System/equipment to be tested:

   a. HVAC system shutdown via BMS.

2. Functions to be tested:

   a. BMS to shut down in accordance with clean agent sequence of operation.

   b. HVAC system to automatically restart upon clean agent system reset.

   c. Timing of HVAC shutdown and closing of fire/smoke and smoke dampers.

3. Conditions of the test:

   a. Prerequisite: Damper and HVAC Level 1 system activities complete.

   b. Prerequisite: BMS normal local fan control set to auto. (See Section 25 08 XX).

4. Acceptance Criteria:

   a. All functions perform as intended and as require by the applicable codes and standards and as required by the Contract.

C. 2108-IS-03 Clean agent communication with FAS:

1. System/equipment to be tested:

   a. Clean agent fire alarm conditions transmission to FAS.

   b. Clean agent supervisory conditions transmission to FAS.

   c. Clean agent trouble alarm conditions transmission to FAS.

2. Functions to be tested:

   a. First smoke detector results in pre-alarm condition or as outlined in the FAS and CAS sequence of operation.

   b. Second smoke detector results in an alarm condition or as outlined in the FAS and CAS sequence of operation.

   c. CAS manual pull station result in an alarm condition or as outlined in the FAS and CAS sequence of operation.

   d. CAS supervisory condition transmits as a general supervisory alarm at the FAS. Test at least the following two conditions:

      1) Agent maintenance bypass switch activated).

      2) Detection circuit disconnected.

   e. CAS trouble condition transmits as a general trouble alarm at the FAS. Test at least the following two conditions:

      1) Simulate battery fault.

      2) Simulate clean agent container low pressure.

3. Conditions of the test:

   a. Prerequisite: FAS Level 1 commissioning activities complete.

4. Acceptance Criteria:

   a. All functions perform as intended and as require by the applicable codes and standards and as required by the Contract.

D. 2108-IS-04 Automatic sprinkler system waterflow/tamper switch interface with FAS

1. System/equipment to be tested:

   a. Waterflow switches (pressure and vane type).

b. Valve tamper switches.

2. Functions to be tested:

a. Water flow switches report as an alarm condition within 15 to 30 seconds. A delay of 15 seconds (to prevent false alarm from water surges) must be established by the contractor by adjusting the waterflow device.

b. Valve tamper switches register as closed when the valve is close by not more than 25 percent.

3. Conditions of the test:

a. Prerequisite: FAS and automatic sprinkler system Level 1 commissioning activities complete.

4. Acceptance Criteria:

a. All functions perform as intended and as require by the applicable codes and standards and as required by the Contract.

E. 2108-IS-05 Fire pump interface with FAS:

1. System/equipment to be tested:

a. Fire pump controller monitoring by FAS.

2. Functions to be tested:

a. Controller - Connected to alternate power source supervisory alarm.

b. Controller - Auto/off/manual supervisory alarm.

c. Controller - Trouble alarm.

d. Controller - Fire pump running.

3. Conditions of the test:

a. Prerequisite: FAS Level 1 and Fire Pump Level 1 Commissioning activities complete.

4. Acceptance Criteria:

a. All functions perform as intended and as require by the applicable codes and standards and as required by the Contract.

F. 2108-IS-06 Control of tunnel deluge valves via FAS:

1. System/equipment to be tested:

a. Tunnel standpipe automatic (deluge) valves.

2. Functions to be tested:

a. Tunnel standpipe opens and fills standpipe in accordance with the emergency response matrix.

3. Conditions of the test:

   a. Prerequisite: FAS Level 1 and EVS Level 1 Commissioning activities complete.

   b. Simulate EVS input to FACP for a tunnel mode launch.

   c. Control valves must be fully open for this test.

   d. Fire hose valves must be closed.

   e. This test replaces the fill time test (2108-SU-02) for tunnel semi-automatic standpipe systems.

4. Acceptance Criteria:

   a. Air release valves performed as intended.

   b. Fill time is less than 10 minutes or other criteria approve by the AHJ.

   c. System may be fully drained at accessible main and low-point drains.

   d. Standpipe bracing and expansion joints performed as designed.

   e. All functions perform as intended and as require by the applicable codes and standards and as required by the Contract.

EXHIBITS (On Proceeding Pages)

1. Exhibit A - Example of an IV Commissioning Activity for Water-Based Fire Protection Systems

EXHIBIT A

<u>NOTE:</u> The following is an example of an IV commissioning activity for water-based fire protection systems.

2100-IV-## Water-based fire protection systems

Facility Location: ST N65 – Edmonds Transit Center

OBJECTIVES:

Verify that the water-based fire protection systems are installed using components based upon approved submittals and that the installation conforms with the approved shop drawings.

INSTRUCTION: A single form may be used for multiple systems, but different forms must be used for verification performed at various stages of the project.

EQUIPMENT TO BE TESTED:

Equipment ID (System)	Description
###	Dry-pipe system ###
###	Dry-pipe system ###
###	Wet-pipe System ###
###	Standpipe System ###

REFERENCE DOCUMENTS:

Notes: (1)					

2100-IV-## WATER-BASED FIRE PROTECTION SYSTEM COMPONENT VERIFICATION

The following checklist items refer to the columns in the table below:

a. The make and model of the materials and/or equipment matches the accepted submittals?
b. The installed materials and/or equipment does not have visible damage, including finishes?
c. Materials are clean, and free of debris?
d. Components located as indicated in approved shop drawings?
e. Accessible for maintenance and the manufacturer's recommended and required maintenance clearances are provided?
f. Installation is in accordance with approved shop drawings including pipe layout, support, seismic, and manufacturer's requirements and contract requirements?

For each item complete columns a-f by entering yes (Y), no (N) or not applicable (NA). Where an "N" is recorded add a note and enter the item in a tracking log for follow up and correction.

Equipment	a	b	c	d	e	f	Notes	Date checked

SECTION 21 11 00

WATER-BASED FIRE SUPPRESSION SYSTEMS

NOTE TO DESIGNER:

SECTIONS WITH BRACKETS. E.G., [TEXT] ARE TO BE MODIFIED OR DELETED IF NOT APPLICABLE. ITALICIZED TEXT PROVIDES INSTRUCTION TO THE DESIGNER TO INCLUDE LANGUAGE ON SPECIFIC TOPICS WHEN APPLICABLE. THE INSTRUCTIONS ARE TO BE DELETED WHEN THE SPECIFICATION IS FINALIZED. LANGUAGE NOT IN BRACKETS MUST BE USED ‘AS IS’ WITHOUT MODIFICATION OR WITH AN APPROVED SPECIFICATION MODIFICATION REQUEST.

DESIGNER TO DELETE TEXT ABOVE FOR FINAL SECTION

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements to Provide all material, labor, equipment, design, and services necessary to perform the complete installation of the fire protection systems as indicated on the Drawings and described in the Specification.

2. This Section includes the following fire-suppression systems.

   a. [Manual dry, Class 1 standpipe system for stations and buildings]

   b. [Manual and Semi-Automatic dry, Class 1 standpipe system for the guideway]

   c. [Wet-pipe sprinkler systems]

   d. [Dry pipe sprinkler systems and pre-action sprinkler systems]

3. Engineering requirements for hydraulic calculations, supports, braces (seismic and thrust forces), fill time, water hammer, and as otherwise outlined in this specification.

   a. In case of conflicts the more stringent of this specification or the requirements of the IFC, NFPA 13, NFPA 14 and NFPA 130 (with AHJ Amendments) will govern.

   b. See Section 21 05 00 - Common Work Results for Fire Suppression for related requirements.

1.02 REFERENCES

A. This Section incorporates by reference the adopted version of the following documents at the time of project permit. If not formally adopted through a code or other rule the most recent version applies:

1. American National Standards Institute (ANSI):

    a. ANSI B16.3 Malleable Iron Threaded Fittings.

    b. ANSI B16.5 Pipe Flanges and Flanged Fittings.

2. American Society of Civil Engineers / Structural Engineering Institute (ASCE/SEI):

    a. ASCE/SEI 7-10 Minimum Design Loads of Buildings and Other Structures.

3. American Society of Mechanical Engineers International (ASME):

    a. ASME B16.1 Gray Iron Pipe Flanges and Flanged Fittings Classes 25, 125, and 250.

    b. ASME B16.4 Gray Iron Threaded Fittings Classes 125 and 250.

    c. ASME B16.9 Factory-Made Wrought Buttwelding Fittings.

    d. ASME B31.9 Building Services Piping.

    e. ASME B36.10M Welded and Seamless Wrought Steel Pipe.

    f. ASME Boiler and Pressure Vessel Code (BPVC), Section IX, Welding and Brazing Qualifications.

4. ASTM International (ASTM):

    a. ASTM A53/A53M Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.

    b. ASTM A123/A123M Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.

    c. ASTM A135/A135M Standard Specification for Electric-Resistance-Welded Steel Pipe.

    d. ASTM A193 Allow-Steel and Stainless-Steel Bolting Material for High Temperature or High-Pressure Service and Other Special Purpose Applications.

    e. ASTM A234/A234M Standard Specification for Piping Fittings of Wrought Carbon Steel and Alloy Steel for Moderate and High Temperature Service.

    f. ASTM A276 Stainless Steel Bars and Shapes.

    g. ASTM A307 Standard Specification for Carbon Steel Bolts, Studs, and Threaded Rod 60000 psi Tensile Strength.

    h. ASTM A312 Seamless and Welded Austenitic Stainless-Steel Pipe.

    i. ASTM A351 Castings, Austenitic, Austenitic-Ferritic (Duplex), for Pressure Containing Parts.

    j. ASTM A536 Standard Specification for Ductile Iron Castings.

    k. ASTM A780/A780M Standard Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings.

    l. ASTM A795/A795M Standard Specification for Black and Hot-Dipped Zinc-Coated (Galvanized) Welded and Seamless Steel Pipe for Fire Protection Use.

m. ASTM B16/B16M Standard Specification for Free-Cutting Brass Rod, Bar and Shapes for Use in Screw Machines.

n. ASTM B733 Standard Specification for Autocatalytic (Electroless) Nickel-Phosphorus Coatings on Metal.

o. ASTM D2000 Standard Classification System for Rubber Products in Automotive Applications.

p. ASTM E94 Standard Guide for Radiographic Examination.

q. ASTM E814 Standard Test Method for Fire Tests of Penetration Firestop Systems.

r. ASTM E1032 Standard Test Method for Radiographic Examination of Weldments.

5. American Welding Society (AWS):

   a. AWS D1.1/D1.1M Structural Welding Code – Steel.

6. Authorities Having Jurisdiction (AHJ):

   a. AHJ Fire Code (International Fire Code with AHJ Amendments).

7. Factory Mutual Global (FM):

   a. FM Approval Guide.

8. Institute of Electrical and Electronics Engineers (IEEE):

   a. IEEE 515 The Testing, Design, Installation, and Maintenance of Electrical Resistance Trace Heating for Industrial Applications.

9. Manufacturers Standardization Society for the Valve and Fittings Industry.

   a. MSS SP 58 Pipe Hangers and Supports – Materials, Design and Manufacture, Selection, Application, and Installation.

10. National Fire Protection Association (NFPA):

   a. NFPA 13 Standard for the Installation of Sprinkler Systems.

   b. NFPA 14 Standard for the Installation of Standpipe and Hose Systems.

   c. NFPA 20 Standard for the Installation of Stationary Pumps for Fire Protection.

   d. NFPA 24 Standard for the Installation of Private Fire Service Mains and Their Appurtenances.

   e. NFPA 25 Standard for the Inspection Testing, and Maintenance of Water Based Fire Protection Systems.

   f. NFPA 130 Standard for Fixed Guideway Transit and Passenger Rail (with AHJ Amendments).

   g. NFPA 1963 Standard for Fire Hose Connections.

11. Underwriters Laboratories (UL):

   a. UL Fire Protection Equipment Directory.

b. UL 193 UL Standard for Safety for Alarm Valves for Fire-Protection Service.

c. UL 199 Automatic Sprinklers for Fire-Protection Service.

d. UL 213 Rubber Gasketed Fittings for Fire-Protection Service.

e. UL 260 Dry Pipe and Deluge Valves for Fire-Protection Service.

f. UL 262 Gate Valves for Fire-Protection Service.

g. UL 312 Check Valves for Fire-Protection Service.

h. UL 346 Waterflow Indicators for Fire Protective Signaling Systems.

i. UL 393 Indicating Pressure Gauges for Fire-Protection Service.

j. UL 405 Fire Department Connection Devices.

k. UL 464 Audible Signaling Devices for Fire Alarm and Signaling Systems.

l. UL 515 Standard for Safety Electrical Resistance Trace Heating for Commercial Application.

m. UL 515A Certified Trace Heating Equipment for Fire Sprinkler Pipes.

n. UL 688 Hose Valve for Fire-Protection Service.

o. UL 753 Alarm Accessories for Automatic Water-Supply Control Valves for Fire Protection Service.

p. UL 1091 Butterfly Valves for Fire-Protection Service.

q. UL 1450 Standard for Safety Motor-Operated Air Compressors, Vacuum Pumps, and Painting Equipment.

r. UL 1474 UL Standard for Safety Adjustable Drop Nipples for Sprinkler Systems.

s. UL 1726 Automatic Drain Valves for Standpipe Systems.

t. UL 1767 Early-Suppression Fast-Response Sprinklers.

u. UL 2573 Outline of Investigation for Automatic Air Release, Air/Vacuum and Combination Air Valves for Fire Protection Service.

12. Washington Administrative Code (WAC):

a. WAC 212-80 Fire Sprinkler System Contractors.

b. WAC 246-290 Cross-connection Control

13. Washington Association of Building Officials (WABO):

a. WABO Welder and Welding Operator Performance Qualification Standard (No. 27-13).

1.03 COORDINATION

A. Comply with project coordination requirements and common work results for fire suppression requirements as required by the Contract.

B. Contractor must coordinate shop drawings with other trades to avoid clashes and verify adequate space for installation of components.

C. All equipment must be installed so it can be accessed for maintenance without requiring the removal of building structure of other trades work to access. Provide access panels where necessary.

1.04 SUBMITTALS

A. Shop drawing, support submittals, and product data must be approved by the Resident Engineer before submission to the AHJ for their approval.

B. Submit the following:

1. Hydraulic Calculations: Provide hydraulic calculations for review prior to fabrication of the systems, signed and sealed by a State of Washington licensed Fire Protection Engineer or a fire sprinkler designer with a current Washington State Certificate of Competency Level III in accordance with WAC 212-80:

a. Complete hydraulic calculations from an approved computer calculation program. Calculation sheets must include the software license name and the UL listing number for verification. Calculations must include water delivery time requirements for dry-pipe sprinkler systems larger than 750 gallons and fill time for guideway standpipe systems.

b. Hydraulic calculations must include information from Hydrant flow test data acceptable to the AHJ Fire Department.

c. Arrange with AHJ Utilities Department for hydrant flow test to be witnessed by Sound Transit and the AHJ Fire Department and submit complete Fire Hydrant flow test report.

d. Contractor must document Fire Department boost requirements to operate standpipe and sprinkler systems.

2. Shop Drawings, and all Manufacturers' product data including pipe, joints, fittings, valves, couplings, fire department connections, piping anchorage and supports, maintenance data, recommended spare parts, labels, tags and signage. Show complete system in shop drawings, including construction phasing:

a. Drawings must show plan view and vertical view including risers, drops to fire department connections and drain piping. Show line layout of each standard joint, special joint, fitting, hanger, and support.

b. Include design calculations for pipe supports and braces and indicate size and characteristics of component and fabrication details.

c. Shop drawings for automatic sprinkler systems and standpipe systems must be no less than 1/8-inch equals one foot scale, prepared in accordance with NFPA 13 showing all sprinkler systems in plan view and including all accessories such as alarm valves, flow switches, drain valves and test connections.

d. Shop drawings for the guideway standpipe systems must be no less than 1-inch equals twenty-foot scale, prepared in accordance with NFPA 13 showing all standpipe systems in plan view, with section views where necessary to show detail, and including all accessories such as fire department connections, fire hose valves, air vents, drain valves and supports. Include dimensions for the train clearance envelope along the entire guideway.

e. Provide fire pump factory shop test and hydrostatic test.

3. Fire-Suppression Systems Support Submittal:

a. Design Calculations: Calculate all forces including and not limited to seismic, wind, train pressures, dead loads, live loads, thermal loads, water hammer, thrust loads acting on the standpipe systems and/or the sprinkler systems.

b. Design Analysis: The pipe supports are not detailed fully on the Issued for Construction Drawings. Provide a support system that will accommodate all loads and movement including seismic movement, structural expansion joints, wind, train pressures, dead loads, live loads, thermal movement, water hammer, and thrust loads. Submit detailed seismic bracing calculations based on NFPA 13 and/or ASCE 7-10. For guideway standpipes systems and other systems/portions of system as required by the Contract, calculations based upon ASCE 7-10 are required. Design sway bracing, fasteners, assemblies, pipe hangers, and equipment supports, using performance requirements and design criteria acceptable to AHJ Fire Department. Pipe supports and bracing must be designed and detailed so the pipe can be installed and replaced without impacting the emergency guardrail or acoustic panels.

c. Support Details: Indicate fabrication and arrangement in accordance with NFPA 13. Detail attachments and to the structure. Show attachment locations, methods, and spacing. Identify components, list their strengths, and indicate directions and values of the prevailing forces transmitted to the structure during seismic events. Support and seismic calculations are required for all systems. For guideway standpipe systems, and other standpipe systems as required by the Contract, the calculation must include thrust and water hammer forces and application of ASCE 7-10:

1) Pre-approval and Evaluation Documentation: For seismic restraints and support devices selected. Documentation must be prepared by an agency acceptable to AHJ, showing maximum ratings of restraint items and the basis for approval (tests or calculations).

4. Signage Submittal: A submittal for signage may be included in the show drawings and product submittal or a separate submittal specific to signage may be provided.

5. [Guideway only: Standpipe Valve Schedule: Provide a valve schedule of fire hose valves, isolation valves, and drain valve in table format using MS Word, 8.5 x 11 inches portrait orientation with title, headers, rows, and columns to serve as a fire department reference in the FCC/FCR. Tabulate valve type, valve identification number, marker direction, distance from designated rail start point in miles, and, for fire hose valves, notes to indicate associated FDCs. See Appendix A – Valve List Sample form).]

C. Transmit the submittals listed above and the following:

1. All product data, shop drawings, and calculations required by this section must be in accordance with the International Fire Code, NFPA 13, [and NFPA 130] as amended by the State of Washington, and the AHJ. Labelling and signage of Fire Department Connections (FDC), tags and numbering of Fire Hose Valves (FHVs) and other associated parts of the system.

2. Product Data: For each type of equipment/product, pipe, valve, pipe hanger, anchorage device and support system component.

3. Certified Test Reports: Provide certified test reports on the Contractor's Material and Test Certificate for Aboveground Piping as shown in NFPA 13.

4. Operation and Maintenance Manuals: Guidelines for operation and maintenance data are required by the Contracts. In addition to these requirements include manufacturer's installation and maintenance data for all fire suppression equipment/products furnished under this specification.

5. Welding Certificates.

6. Welding report interpreting weld radiographs to the Resident Engineer.

1.05 QUALITY ASSURANCE

A. Steel Pipe Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code (BPVC): Section IX, "Welding and Brazing Qualifications":

1. Comply with welding provisions in NFPA-13 & NFPA-14.

2. Certified WABO welders. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.

B. Support, Bracing, and Structure Welding:

1. Comply with the requirements of AWS D1.1/D1.1M, as applicable.

C. Employ welders and/or welding operators and welding procedures qualified in accordance with the requirements of Section IX of the ASME Boiler and Pressure Vessel Code.

D. Provide working plans for and final calculations based upon the engineers' design, by a fire sprinkler designer with a current Washington State Certificate of Competency Level III (engineering technician) in accordance with WAC 212-80.

E. [Seismic Design Engineering Responsibility: For guideway standpipe system the contractor must employ or contract with a structural engineer registered in the State of Washington to perform calculation for supports, braces, and other means to address structural expansion joints, thermal expansion, seismic forces, thrust forces.]

Designer: The requirement for the contractor to hire a structural engineer depends upon how much detail is provided by the EOR and the need for latitude with contractor means and methods for the guideway standpipe. ST experience is that most contractors are not well suited to bring on an outside SE to provide support for this work. ST believes the best practice is for the EOR to take the design much further so that an engineering technician may complete the design without performing complex engineer on thermal expansion, seismic forces, thrust forces, and expansion joint design. The FP EOR must determine how to mitigate water hammer.

F. Provide automatic air/vacuum valve size and location analysis and calculations for valve sizing for dry standpipe systems serving guideway.

G. Verify materials are clearly marked with the manufacturer's name, nameplate data or stamp, rating, and ASTM conformance number, as applicable:

1. Use only fire protection system components and equipment that is Underwriters Laboratories (UL) Listed or labeled and Factory Mutual (FM) approved for use in fire protection systems, unless otherwise required by the AHJ. All piping materials must conform to the requirements of NFPA 13 and NFPA 14.

H. Verify that materials used are:

1. Inspected prior to preparation and installation for conformity to pipe tolerances (ex. Stainless outside and inside diameters, wall thickness, ovality, pipe end flare, end square cut, etc.).

2. Inspected post fabrication for installation for conformity to pipe and grooving tolerances (ex. Gasket seating area, groove/cut width, groove/cut base radius, groove/cut depth, pipe end flare, groove/cut radius, where required, etc.).

3. Installations which exceed the tolerances associated with pipe end characteristics or roll/cut groove tolerance is not permitted to be used within the fire protection system.

I. All pipe fitters must have manufacturer training or demonstrated experience in proper use of grooving tools, application of groove, and installation of grooved piping products.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Deliver materials and equipment in original, sealed containers or packages in an undamaged condition complete with labels and instructions for handling, storing, unpacking, protection and installing.

1.07 PROJECT CONDITIONS

A. The contractor must review the Issued for Construction Drawings to determine if a space/area is conditioned and exposed to direct or wind-blown precipitation so that the appropriate equipment may be provided.

1.08 WARRANTY

A. The Contractor must obtain and submit the manufacturer’s warrantees which provide that all fire alarm system components furnished under this Contract must be warranted against defect in design, material and workmanship for the full warranty time which is standard with the manufacturer and/or supplier but not less than two (2) years after system acceptance.

Designer: confirm the two-year warranty aligns with other contract language and that the start date is clear.

PART 2 - PRODUCTS

2.01 LEEDS COMPLIANCE – NOT USED

2.02 PERFORMANCE/DESIGN REQUIREMENTS

A. The water-based fire suppressions systems are a delegated design. The design must conform to the drawings and other requirements outlined in this specification and as required by the Contract.

B. See NFPA 13 and NFPA 14 for system definitions including, but not limited to wet-pipe sprinkler system, dry-pipe sprinkler system, preaction sprinkler system, manual dry standpipe, manual wet standpipe, and semiautomatic dry standpipe.

C. For semiautomatic dry standpipes serving the guideway the NFPA 14 definition is modified. The automatic valve is provided to reduce fill time. The system relies exclusively on the fire department connection to supply the system demand.

D. [The guideway standpipe system must be designed to provide the following:]

a. [Manual or semiautomatic as indicated in the drawings.]

b. [To be fed from two locations, unless waive by the AHJ for short segments (< 800 feet) and provided with isolation valves installed at not more than 800 feet (244 m) apart.]

c. [To have a water delivery time of 10 minutes or less based upon a fill rate of 1,000 gpm or as required by the AHJ.]

d. [To have combination air relief vacuum valves installed at each high point and as required by NFPA 130 and as shown in the Issued for Construction Drawings on the standpipe for effective filling and to mitigate water hammer.]

e. [Cross connected every 2400 feet in tunnels via cross passages and as indicated on the drawings.]

f. [Unless amended by the AHJ, the standpipe is to have a minimum flow of 750 gpm (250 gpm at each of the three remote fire hose valves). See drawings for design pressure and volume criteria which may vary by jurisdiction.]

g. [Unless otherwise indicated, the following is maximum acceptable residual pressure at nominal flow through each Hose-Connection Outlet: 175 pounds per square inch gauge. When the standpipe is fed from two locations it must be designed to be filled from a single FDC and serve the hydraulically most distant hose valves.]

Designer: Delete the section above if there is no guideway standpipe.

E. Non-guideway standpipe system design must provide for the following:

1. Minimum Residual Pressure at each Hose-Connection Outlet: [100] pounds per square inch gauge.

2. Unless otherwise indicated, the following is maximum acceptable Residual Pressure at nominal flow through each Hose-Connection Outlet: 175 pounds per square inch gauge.

3. The standpipe is to have a minimum flow in accordance with NFPA 14 and not less than 500 gpm for standpipes not serving the guideway, or as otherwise required by the AHJ.

F. Fire-suppression sprinkler system design must provide for the following:

1. Owner margin of safety for available pressure at design water flow conditions: A ten (10) pounds per square inch, or ten (10) percent, whichever is less when allowed by the AHJ, reserve cushion between the available water supply pressure and hydraulically calculated pressure at system design demand is required.

2. Sprinkler Occupancy Hazard Classifications: Indicated on the Issued for Construction Drawings and in accordance with NFPA 13. Any areas not specifically identified on the Issued for Construction Drawings must comply with the following unless the AHJ requires a higher level of protection:

a. Building Service Areas: Ordinary Hazard, Group 1.

b. General Storage Areas: Ordinary Hazard, Group 1.

c. Mechanical Equipment Rooms: Ordinary Hazard, Group 1.

d. Platform Areas: Light Hazard.

e. Concourses and Other Public Areas: Light Hazard.

f. Parking Garage Areas: Ordinary Hazard Group 2.

g. Over the trainway in enclosed station when required: Per AHJ requirement.

3. Minimum Density for Automatic-Sprinkler Piping Design: As Indicated in NFPA 13 and on the Issued for Construction Drawings.

4. Maximum Protection Area per Sprinkler:

a. According to NFPA 13, unless otherwise indicated.

5. Total Combined Hose-Stream Demand Requirement: According to NFPA 13, unless otherwise indicated:

G. Seismic Performance: Fire-suppression piping and support system must be capable of withstanding the effects of earthquake motions determined according to NFPA 13.

H. [Thermal expansion: Guideways standpipe systems must be capable of expansion and contraction of piping without restraint (putting pipe, couplings and fitting into tension or compression) unless specifically designed for restraint by the registered structural engineer.]

2.03 SYSTEMS/EQUIPMENT

A. Specific manufacturers and model numbers, where noted, are to indicate a standard of design and are not intended to be restrictive.

B. All materials necessary to make the installation complete in every detail must be furnished and installed whether specifically shown on Issued for Construction Drawings or specified in this specification.

C. Provide pipe, tube and fittings of the type, fitting requirements, grade, class, size, and weight indicated or required for each service.

1. Where type, grade, or class is not indicated, provide proper selection as determined by installer for installation requirements, and comply with governing regulations and industry standards.

D. All materials and equipment in the system must be new and current products of the manufacturer’s latest design and suitable to perform the functions intended, as listed under manufacturers.

1. Where two or more pieces of equipment are required to perform interrelated functions, they must be products of one manufacturer.

E. All devices, components and equipment having a similar or identical appearance or function must be the products of the same manufacturer.

F. All components and equipment within the UL testing laboratory service’s scope must be listed by the Underwriters’ laboratories for the purpose for which they are used. If no products are available FM approval may be used if acceptable to the AHJ.

G. Product marking. Each major component must be furnished with legible markings indicating; name of the manufacturer, part numbers and serial numbers, and markings as required per ASTM standards.

H. All piping, couplings, supports, hangers, and hardware where exposed to direct or wind-blown precipitation, installed in a corrosive atmosphere, or installed in direct contact with surfaces expected to be wet, must be protected against corrosion and be stainless steel and/or hot-dipped galvanized.

I. Supports, anchors, braces, and associated hardware in unconditioned space must be electrogalvanized or zinc electroplated.

2.04 ACCEPTABLE MANUFACTURERS

A. If acceptable manufacturers are not listed in this Section, refer to the Articles describing each specific product type.

B. All products will be required to meet project specifications and be UL listed or FM approved.

C. The following pipe fitting manufacturers will be acceptable. Fittings must be rated for at least a 175 pounds per square inch gauge working pressure, except when higher pressure ratings are specified for the different piping components under their individual descriptions:

1. Threaded piping fittings, Class 150, ANSI B16.3 threaded malleable iron Class 125, ASME B16.4 cast iron, or Class 150 ductile iron:

a. Anvil.

b. Star Products, Inc.

c. Ward.

2. Welding fittings ASME B16.9 made of ASTM A234/A234M Grade WPA or WPB steel with wall thickness identical to pipe in which installed:

a. Babcock & Wilcox.

b. Anvil.

c. Ladish.

d. Taylor Forge.

e. Tube-Line.

f. Tube-Turn.

g. Weld Bend.

3. Flanges, Class 150, ANSI B16.5, raised face, forged steel, threaded or welding neck type where specified and/or required:

a. Anvil.

b. Ladish.

c. National Flange.

d. Taylor Forge.

e. Weld Bend.

D. The following weld fitting manufacturers will be acceptable:

1. Branch pipes more than one size smaller than the diameter of the main pipe:

a. Bonney Forge “Weldolet” or “Threadolet” ASME B16.9.

b. Anvil Forged Steel Weldolet or Threadolet ASME B16.9.

c. “Weldolet”, “Threadolet” and Merit fittings and shaped nipples must have a minimum wall thickness which matches the run pipe and branch pipe wall thickness (whichever is greater) and must be suitable for the working pressure and temperature of the pipe to which they connect.

2. For branch sizes 3 inches and smaller shaped nipple welding fittings with factory beveled ends:

   a. Allied Type T-1 and T-2.

   b. Anvil.

   c. Tube Forgings.

   d. Tube-Turn.

   e. Wheeling.

   f. Do not make any branches by burning a hole in the main and welding in the branch line.

E. The following pipe hanger and support manufacturers will be acceptable:

   1. B-Line.

   2. Anvil.

   3. Fastenal.

   4. Michigan Hanger.

   5. PHD.

   6. Tolco.

F. Grooved style couplings and fittings may be used in lieu of welded or screwed joints specified in this specification before as follows:

   1. General Requirements:

      a. Couplings and fittings must be listed for fire protection and suitable for the intended application.

      b. Gaskets and lubricant must be as indicated in UL Listing or FM Approval and as recommended by the manufacturer for the application.

      c. Ductile iron fittings and couplings: Fittings and couplings must be ductile iron and listed for a minimum of 300 pounds per square inch working pressure. Bolts and nuts must be electrogalvanized, or zinc electroplated. Anvil, Grinnell, Gruvlock, Victaulic or equal as acceptable to the ST specification owner.

      d. For dry-pipe systems and dry standpipes systems using black steel or galvanized steel pipe, provide rigid or flexible cut groove couplings. Roll grooved couplings and fittings are not allowed.

      e. Fittings/coupling for use on the galvanized pipe standpipe systems must be steel with stainless steel or hot dip galvanized steel bolts and nuts.

      f. Couplings and fittings for use on black steel pipe must be factory painted/coated with rust inhibiting materials coating).

g. [Fittings/couplings for use on the stainless-steel standpipe systems must be stainless steel with stainless steel bolts and nuts.]

h. [Stainless Steel Couplings: UL listed for fire protection, 316 stainless steel body, 304 or 316 SS bolts and nuts, for rigid and flexible couplings. GroovJoint #24 (rigid) and Victaulic #77s (flexible) or approved equal as acceptable to the ST specification owner.]

i. [For stainless steel piping cut groove must be used for schedule 40 pipe and roll groove must be used for schedule 10 piping.]

2. Mechanical tee fittings are not permitted except for where specifically listed in this specification.

3. Mechanical Tee Fittings: UL listed or FM approved, ductile iron, full body, threaded or grooved end, mechanical tees are acceptable for use on sprinkler cross main piping for branch piping outlets, and standpipes for fire hose valve and air vent outlets. Anvil MT1 or MT2, Victaulic FireLock Style 920, Gruvlock Fig 7045 or 7046 or equal as acceptable to the ST specification owner. Holes must be cut, not burned. Coupons created by hole cut outlets must be secured to the fittings via zip-tie or wire.

4. Factory-formed cut groove ends must be provided for galvanized pipe.

    1) Exception: Up to 10 percent of the grooves may be cut by the contractor if then coated with cold zinc coating.

5. Except for hole cuts associated with mechanical tees, galvanized piping and fittings are to be hot dip galvanized from the factory or shop welded and hot-dipped galvanized after welding.

6. Pipe roll grooves made by the contractor must be made by a tool recognized by the grooved coupling manufacturer.

7. Coupling manufacturer’s groove depth control tool must be used for field and shop grooved piping.

8. Couplings and fittings provided for a single facility (e.g., garage, station, trainway) must be of one manufacturer.

G. The following flange gasket manufacturers will be acceptable:

1. Crane.
2. Dallas Gasket.
3. Garlock,
4. Or equal as acceptable to the ST specification owner.

H. Check valves manufactured by one of the following manufacturers will be acceptable:

1. Crane.
2. Anvil.
3. Kennedy.
4. Mueller.
5. Nibco.

6. Victaulic.
7. Viking.

I. Gate valves manufactured by one of the following manufacturers will be acceptable:

1. Mueller.
2. Crane.
3. Croker.
4. Fairbanks.
5. Anvil.
6. Jenkins.
7. Kennedy.
8. Milwaukee.
9. Nibco.
10. Viking.
11. Walworth.
12. Victaulic.

J. Butterfly valves manufactured by one of the following manufacturers will be acceptable:

1. Anvil.
2. Jenkins.
3. Milwaukee.
4. Nibco.
5. Victaulic.

K. Floor control valves manufactured by one of the following manufacturers will be acceptable:

1. Croker.
2. Elkhart “Pressure-Matic”.
3. Guardian.
4. Potter-Roemer.
5. Standard “Pressuretrol.”
6. Zurn.

L. Specialty valves such as alarm check valves, deluge, dry pipe valves and double interlocked preaction sprinkler systems (or single interlocked preaction sprinkler system) manufactured by one of the following manufacturers will be acceptable:

1. Tyco.
2. Victaulic.
3. Anvil.

4. Notifier.

5. Reliable Sprinkler Company.

6. Viking Corp.

2.05 STEEL PIPE AND FITTINGS

A. Black steel piping must be ASTM A53/A53M Grade B (Grade A acceptable for up to 4 inch), ASTM A135/A135M or ASTM A795/A795M.

B. Galvanized piping must be hot-dipped ASTM A795/A795M or ASTM A53/A53M Grade B.

C. Stainless steel piping must be ASTM A312/A312M Type 316S).

D. Pipe must be manufactured in the United States and approved for fire protection use.

E. Electric resistance welded pipe must be fully normalized at the seams after welding.

F. Pipe sizes larger than 6-inch must not be utilized for guideway standpipe systems.

G. Pipe type and wall thickness must be in accordance with the drawings and the following:

1. Standpipe systems:

a. Guideway (up to and including 6-inch diameter only) Including Guideway Piping Passing Through Stations and Garages:

1) Schedule 40, stainless steel (2-1/2-inch & smaller diameter).

2) Schedule 10, stainless steel (larger than 2-1/2-inch diameter).

3) Schedule 40, galvanized steel.

b. Stations (all diameters):

1) Schedule 40 galvanized steel.

2) Schedule 40 steel pipe, painted after installation, may be used in lieu of galvanized pipe in enclosed areas of enclosed stations.

c. Parking Garages (all diameters):

1) Schedule 40 black steel pipe, painted after installation.

2) Schedule 40 galvanized steel for areas exposed to direct or wind-blown precipitation.

d. Wet standpipe systems (heated facilities only):

1) 1 inch through 2-1/2 inches: Schedule 40 black steel

2) 2-1/2 through 6 inches: Schedule 10 black steel.

2. Wet-pipe systems including supply/feed mains):

a. 1 inch through 2-1/2 inches: Schedule 40 black steel

b. larger than 2-1/2 inches: Schedule 10 black steel

3. Dry-pipe and preaction sprinkler systems (all diameters):

a. [Schedule 40 galvanized steel.]

[Schedule 40 black steel pipe, painted after installation, and provided with a desiccant dryer].

Designer:

In consultation with ST specification owner select either galvanized steel pipe or painted black steel pipe.

Painting the pipe may be specified in another part of the contract for aesthetics If so, drop the requirement from this specification or revise it read "by others".

At the time of publishing this guide specification ST Ops was not allowing nitrogen generating system for dry-pipe systems. This position could change over time and the designer is to confer with ST to discuss corrosion prevention.

H. Coat all exposed threads and mechanical tee hole cut outs on galvanized pipe with 93 percent zinc rich coating.

I. Fire protection systems utilizing Schedule 40 pipe to be of threaded for diameters of 2-inch and below, and of welded or cut groove construction for diameters of 2-1/2-inch and above. Do not use roll groove construction on dry pipe or preaction systems.

J. Guideway standpipe systems utilizing Schedule 40 pipe to be threaded for diameters of 2-inch and below, and of butt welded or cut groove construction for diameters of 2-1/2-inch and above. Schedule 10 stainless piping may be roll grooved.

K. Mechanical tees are not allowed except for sprinkler branch lines, fire hose outlets and air release valves. Locate outlets in the side or top of the pipe only

L. Guideway standpipe systems must have a maximum working pressure of 300, or greater if necessary to meet hydraulic demand.

M. Flanges are required for servicing and/or removal of equipment for repair in butt welded systems. Schedule 10 pipe to be joined by roll grooved fittings only.

N. Flange connections must have matching flat faces or raised faces and meet system pressure requirements. Steel flanges must have a medium tool finish and must be flat face medium finish. Grooved 150-pound flange adapters must be Victaulic 45F or Gruvlok Fig. 7084 using flange washers to join to the rubber faced serrated flanged components or raised faced flanges. Serrated flanges or raised face flanges must use a full-face red rubber gasket between the grooved flange washer and the flange to provide an acceptable sealing surface. Roll groove flange adapters are acceptable in wet pipe fire protection systems.

O. Screw joints to be made up with approved pipe joint compound. Screw threads are to be in accordance with American Pipe Thread Standards.

P. Flange gasket material to be as specified in this specification and must also be suitable for the service and pressure class intended and comply with ANSI B16.21.

1. Gaskets to be minimum 1/16 inch thick for all pipe sizes 10 inch and smaller; and minimum 1/8 inch thick for all pipe sizes 12 inch and larger. Gaskets must be ring type between raised face flanges and full-face type between flat face flanges with punched bolt holes and pipe opening.

2. Gaskets to be compressed non-asbestos with a nonstick clean surface and factory applied parting agent applied to both sides of the gasket.

3. Gaskets to contain no asbestos.

Q. Flange bolting materials for flanges in service at 399 degrees Fahrenheit or below to be carbon steel ASTM A307 Grade B hexagon head bolts and nuts. Cap screws utilized with flanged butterfly valves must be ASTM A307 Grade B cap screws with hexagon heads. Flange bolt thread lubricant must be an anti-seize compound. Thread lubricant designed for temperatures up to 1000 degrees Fahrenheit, must be Crane Anti-seize Thread Compound or equal as acceptable to the ST specification owner. Where the configuration or arrangement of flanges prevent the installation of machine bolts, stud bolts are an acceptable alternative. Flange bolts and nuts for galvanized pipe must be hot-dipped galvanized. Flange bolts and nuts for stainless steel pipe must be stainless steel.

2.06 DUCTILE-IRON PIPE AND FITTINGS

A. Ductile-Iron Pipe: AWWA C151 cement lined, Class 51 or 53 compatible with TR-Flex boltless restrained joints.

B. Where passing under a ballasted trainway must be cement-lined ductile iron and protected for corrosion using factory applied zinc exterior coating with a biocide enhanced polyethylene encasement or equal as acceptable to the ST specification owner.

C. Fittings: AWWA C153 / ANSI A21.53 Ball and Socket with TR-Flex boltless restrained joints.

D. Mechanical-Joints: Limit use of restrained mechanical joints and bolted joints are allowed where ball and socket joints are impractical.

1. Mechanical-Joint, Ductile-Iron Fittings: AWWA C110, ductile- or gray-iron standard pattern.

2. Glands, Gaskets, and Bolts: AWWA C111, ductile- or gray-iron restraining glands, rubber gasket, and stainless-steel bolts and nuts.

2.07 BACKFLOW PREVENTER

A. Backflow Preventor Assembly: Stainless-Steel body with integral control valve and testing ports, OSY valves or butterfly valves with integral tamper switches with flange or groove fittings. UL Listed or FM approved with certified flow characteristics.

B. Pattern: Horizontal, vertical, or N-shaped oriented

C. Approval: Backflow devices must be approved backflow preventor assembly per WAC 246-290.

D. Manufacturer:

1. Ames.

2. Febco.

3. Watts.

4. Zurn.

5. Or equal as acceptable to the ST specification owner

Designer: When there is a need to locate the backflow preventer in a vault, confer with ST and coordinate with Civil.

2.08 SPRINKLER SPECIALTY FITTINGS

A. Sprinkler specialty fittings must be UL listed, with 175 pounds per square inch gauge minimum working-pressure rating and made of materials compatible with piping.

B. Sprinkler Drain and Alarm Test Fittings: Cast- or ductile-iron body; with threaded or locking-lug inlet and outlet, test valve, and orifice and sight glass.

1. Manufacturers:

   a. Central Sprinkler Corp.

   b. Fire-End and Croker Corp.

   c. Viking Corp.

   d. Victaulic Co. of America.

C. Sprinkler Branch-Line Test Fittings: Brass body with threaded inlet, capped drain outlet, and threaded outlet for sprinkler:

1. Manufacturers:

   a. Elkhart Brass Mfg. Co., Inc.

   b. Fire-End and Croker Corp.

   c. Potter-Roemer; Fire-Protection Div.

D. Sprinkler Inspector's Test Fitting: Cast- or ductile-iron housing with threaded inlet and drain outlet and sight glass:

1. Manufacturers:

   a. AGF Manufacturing Co.

   b. Central Sprinkler Corp.

   c. G/J Innovations, Inc.

   d. Triple R Specialty of Ajax, Inc.

E. Drop-Nipple Fittings: UL 1474, adjustable with threaded inlet and outlet, and seals:

1. Manufacturers:

   a. CECA, LLC.

   b. Merit.

2.09 LISTED FIRE-PROTECTION VALVES

A. Valves must be UL listed, with minimum pressure rating as specified below. If pressure rating is not specified minimum acceptable rating is 175 pounds per square inch gauge.

B. Valves for the Guideway system are to have a minimum working pressure rating of 300 pounds per square inch gauge.

C. Ball Valves 2-inch NPS and smaller: Provide ball valves for drain service and as shown on Issued for Construction Drawings of size as indicated. Where low point drains are not indicated, provide a drain valve as required by NFPA 13 and NFPA 14 respectively for the Sprinkler and Standpipe systems. Valves located in public areas must be lockable:

1. Furnish ball drains of a full or standard port, female threaded, brass body ball valves design. Forged Brass Body: conform to ASTM B16/B16M with ball and stem of chrome plated brass or stainless steel. Supply seat and stem washer of tetrafluoroethylene TFE and O Ring of Fluoroelastomer. Provide with lockable carbon steel zinc plated handle.

2. Ball Valve: UL Listed and rated for 600 pounds per square inch water-oil-gas (WOG):

   a. Where used for other than drain service provide Indicating Type Ball Valves: UL 1091, with integral indicating device and ends matching connecting piping. Indicator: Provide with pre-wired, single-circuit, supervisory switch suitable for installation in a 115-volt AC electrical system.

3. Manufacturers:

   a. Global Safety Products, Inc.

   b. Milwaukee Valve Company.

   c. Watts Regulator,

   d. Or equal as acceptable to the ST specification owner

D. Butterfly Valves 2-1/2-inch NPS and larger: UL 1091, designed for fire protection service with grooved ends, polyphenylene sulfide blend coated ductile iron body. Disc must be ductile iron conforming to ASTM A536 with electrolysis nickel coating conforming to ASTM B733. Furnish with nitrile (Grade T) seat conforming to ASTM D2000. Use only valves UL Listed for minimum 300 pounds per square inch service in fire protection systems. Furnish valve with gear operated actuator and hand wheel. Actuator must have bronze traveling nut on a steel lead screw contained in ductile iron housing. Valve must have a black alkyd enamel coating. Furnish complete with two single-pole double-throw (SPDT) supervisory switches factory wired to junction box. For guideway standpipe only, furnish without supervisory switches and secure with padlock and chain:

1. Manufacturers:

   a. McWane, Inc.; Kennedy Valve Div.

   b. Mueller Company.

   c. NIBCO.

   d. Pratt, Henry Company.

   e. Victaulic Co. of America.

   f. Gruvlok from Anvil International.

E. Check Valves NPS 2 and Larger: UL 312, swing type, cast-iron body with flanged or grooved ends:

1. Manufacturers: As listed in Article 2.04, in this specification.

F. Gate Valves: UL 262, OS&Y type:

1. NPS 2 and Smaller: Gate valves up to and including 2-inch size Kennedy Figure 66, 175 pounds per square inch gauge cold water, UL listed, bronze body, bronze trim, single disc, outside screw and yoke, screwed bonnet valves with seats of bronze, screwed ends, and tamper switch:

   a. Other Acceptable Manufacturers:

1) Crane Co.; Crane Valve Group; Crane Valves.

2) Hammond Valve.

3) NIBCO.

2. NPS 2-1/2 and Larger: Gate valves 2-1/2-inch through 10-inch, Kennedy Figure 4068, 175 pounds per square inch gauge cold water, UL listed and approved iron body, outside screw and yoke bolted bonnet valves with double or single disc, Class 125 ASME B16.1 flanged ends, bronze trim, bronze seats, and tamper switch:

a. Other Acceptable Manufacturers: As listed in Article 2.04, in this specification.

2.10 SPECIALTY VALVES

A. Equipment must be UL listed.

B. Dry Pipe System:

1. Dry Pipe Valves (ALV):

a. Dry pipe and pre action valves must be equal to Victaulic NXT with low pressure regulator (or equal as acceptable to the ST specification owner) to reduce water delivery time.

b. Provide where indicated a dry pipe valve equipped to give a signal upon operation, complete with standard trimmings, including water and air pressure gauges, test by-pass and necessary piping, fittings and accessories required for a complete installation.

c. They system must be designed to limit the number of drain valve points with most of the water drained back to the main drain valve.

d. Provide pressure alarm switch. Electric connection to the Fire Alarm Panel will be by electrical requirements as required by the Contract.

e. Provide a low air pressure trouble switch. Field electric connection will be per the requirements of the fire detection and alarm as required by the Contract. Switch will alarm at the Fire Alarm Panel. Coordinate switch requirements with the fire detection and alarm requirements as required by the Contract.

f. Dry pipe valves must be in accordance with UL 260.

2. Flow Control (Deluge) Valve: Automatic valve for filling tunnel dry standpipe automatically and manually:

a. Quick opening, differential diaphragm flood valve with spring-loaded clapper. UL Listed, FM Approved as an on-off multi cycle valve. Viking model J Flow Control Valve with Model 11591 solenoid valve and local manual activation valve.

b. Two position ignition switch style keyed maintenance bypass switch and signage applicable to the application.

c. Within the same room, there must also be a butterfly valve and normally closed test connection located downstream of the deluge control valve such that deluge control valve testing may be performed without requiring the full standpipe system to be flooded:

3. Compressors: Provide air compressors in accordance with NFPA 13, the drawings, and the following:

   a. Where more than one dry-pipe system is in a riser room, a single tank-mounted compressor must serve all dry-pipe valves. Riser mounted compressors are permitted for location with only a single system.

   b. Tank mounted compressors must be limited to serve up to eight dry-pipe systems and 5,000 gallons total.

   c. Compressors must be rated fire protection (UL 1450 VDUR), rated below 65 dBA when operating, and powered by a hard-wired dedicated circuit with a local disconnect switch per NEC 430.102(B).

   d. An air-maintenance device must be provided for each dry-pipe and pre-action system.

   e. Electrical requirements must be suitable for the voltage provided and conform to the drawings. Desiccant manual air dryers to remove water from compressed air systems.

   f. Coalescing filter to protect desiccant filter from oil vapor and other contaminants, when applicable.

   g. Desiccant air dryer, General Air AD3500, or equal as acceptable to the ST specification owner.

C. Wet-pipe System:

1. Wet-pipe system must be provided with a basic wet-pipe riser assembly in accordance with NFPA 13.

2. A basic wet-pipe riser assembly must be provided with an indicating butterfly isolation valve, check valve, paddle type waterflow switch, main drain valve, inspectors test connection with site glass where required, and pressure gage with service valve. Combination test and drain devices are permitted. Components must meet the requirements of this specification.

D. Automatic Drain Valves: UL 1726, NPS 3/4, ball-check device, straight or angle pattern with threaded ends. Valve is used to drain low point of system between fire department connection and swing check valve. Seals automatically under pressure:

1. Manufacturers:

   a. AFAC Inc.

   b. Grinnell Fire Protection.

   c. Potter Roemer,

   d. Or equal as acceptable to the ST specification owner.

E. Automatic Air/Vacuum Valve (AAVV): UL 2573, Valve is used to vent air from a pressurized fire protection system and allow for air to enter the system to help facilitate draining:

1. Manufacturers/models:

   a. Cla-Val 33ATD.

   Designer: The products listed below are not listed for fire service but appropriate for the application and acceptable to ST. Obtain AHJ concurrence for the use of these products or specify an alternate product.

b. Valmatic 100s (Not UL listed for fire service but acceptable if approved by the AHJ)

c. Cla-Val 35 (Not UL listed for fire service but acceptable if approved by the AHJ), or equal as acceptable to the ST specification owner.

F. Drain and Other Valves:

1. Listed Fire-Protection Valves: UL listed and/or FM approved for applications where required by NFPA 13 and NFPA 14. Unless valve type is called out on the Issued for Construction Drawings provide:

a. Shutoff Duty or Fire Isolation Valves (FIV): Butterfly or gate valves.

b. Auxiliary Drain: Ball valves with lockable handle.

2. Unlisted General-Duty Valves: For applications where UL-listed and FM-approved valves are not required by NFPA 13 and NFPA 14. Unless valve type is called out on the Issued for Construction Drawings provide:

a. Shutoff Duty: Butterfly or gate valves.

b. Throttling Duty: Globe valves.

3. Drum drips: Drum drips must be provided where required by NFPA 13, with vertical orientation, lockable ball valves, brass hose bib, and auxiliary drain sign.

4. Air venting valves:

a. Pressure relief valve: UL ### Design to relieve excess pressure caused by pressure surges or temperature changes in wet-pipe sprinkler systems.

2.11 SPRINKLERS

A. Sprinklers must be UL listed and/or FM approved, with 175 pounds per square inch gauge minimum pressure rating.

B. Manufacturers:

1. AFAC Inc.

2. Central Sprinkler Corp.

3. Firematic Sprinkler Devices, Inc.

4. Globe Fire Sprinkler Corporation.

5. Grinnell Fire Protection.

6. Reliable Automatic Sprinkler Co., Inc.

7. Star Sprinkler Inc.

8. Venus Fire Protection, Ltd.

9. Victaulic Co. of America.

10. Viking Corp.

C. Automatic Sprinklers: With heat-responsive element complying with the following:

1. UL 199, for nonresidential applications.

2. UL 1767, for early-suppression, fast-response applications.

D. Sprinkler Types and Categories: Nominal 1/2-inch orifice for "Ordinary" temperature classification rating, unless otherwise indicated or required by application.

E. Sprinkler types, features, and options as follows:

1. Concealed ceiling sprinklers, including cover plate.

2. Flush ceiling sprinklers, including escutcheon.

3. Pendent sprinklers.

4. Quick-response sprinklers.

5. Recessed sprinklers, including escutcheon.

6. Sidewall sprinklers.

7. Upright sprinklers.

F. Sprinkler Finishes: Chrome plated, bronze, and painted.

G. Special Coatings: Wax, lead, and corrosion-resistant paint.

H. Sprinkler Escutcheons: Materials, types, and finishes for the following sprinkler mounting applications. Escutcheons for concealed, flush, and recessed-type sprinklers are specified with sprinklers:

1. Ceiling Mounting: Chrome-plated steel, one piece, flat.

2. Sidewall Mounting: Chrome-plated steel, one piece, flat.

I. Sprinkler Guards: Provide UL listed sprinkler guards for sprinkler heads subject to mechanical damage or for any sprinkler lower than 7 ft. - 0 in. above the floor and as indicated required by the Contract.

J. Sprinkler Cabinet: Finished steel cabinet and hinged cover, with space for minimum of 6 spare sprinklers plus sprinkler wrench, suitable for wall mounting:

1. Include number of sprinklers required by NFPA 13 and 2 wrenches for sprinklers.

2. Include separate cabinet with sprinklers and wrench for each style sprinkler on Project.

3. Cabinet shelves must be marked with a permanently attached etched metal or plastic sign to indicate each type of sprinkler head installed and their locations within the building.

2.12 FIRE HOSE OUTLET VALVES

A. Provide Fire Hose Valves (FHV) for use by the AHJ Fire Department installed on the standpipe systems.

B. Manufacturers:

1. Elkhart Brass Mfg. Co., Inc.

2. Fire-End and Croker Corp.

3. Potter-Roemer; Fire-Protection Div.,

4. Or equal as acceptable to the ST specification owner.

C. Standard Hose Valves:

1. Non-pressure reducing/restricting 21/2-inch angle type cast brass; UL 688 Listed and valve rated to 300 pounds per square inch. Furnish with die cast aluminum wheel and the AHJ Fire Department compatible 2.5-inch male hose thread outlet:

   a. Garage: Rough chrome plate or rough brass finish.

   b. Station, Guideway, and other facilities: Rough Chrome Plate Finish.

2. Hose outlet must be located between 36 and 60 inches above finished floor.

3. Provide hose valves as scheduled on the fire protection drawings.

4. Provide threaded brass female caps, with 1/8-inch drain hole in the face, and brass chain for elevated guideways, tunnels, and other areas not accessible to the public.

5. Provide threaded thermoplastic female caps with 1/8-inch drain hole in the face, and a corrosion resistant metal chain for locations accessible to the public including fire hose valves located in egress stairs and inside fire hose cabinets. Firehose Direct NH Cap or equal as acceptable to the ST specification owner.

D. Standpipe Hose Valve Cabinets:

1. Where required to conceal the fire sprinkler standpipe hose valves, contractor must provide fire rated hose valve cabinets. Cabinet trim style and colors must be coordinated with and approved by the architect prior to ordering.

2. Fire-Rated Hose Valve Cabinet must be listed and labeled to comply with requirements of ASTM E814 for fire-resistance rating of walls where they are installed.

3. Construction:

   a. Cabinets must be constructed of cold-rolled sheet steel with double walls fabricated from 0.0428-inch- (1.1-mm-) thick, cold-rolled steel sheet lined with minimum 5/8-inch- (16-mm-) thick, fire-barrier material. Provide factory-drilled mounting holes.

   b. Finish: Baked enamel or powder coat. Color as selected by Contracting officer and approved by AHJ from full range or industry colors and color densities.

   c. Fully recessed cabinet: One-piece combination trim and perimeter door frame overlapping surrounding wall surface with exposed trim face and wall return at outer edge (backbend). Trim must be same material and finish as the door.

   d. Door must be one-piece sheet metal with continuous piano hinge, viewing panel, and tamper resistant door hardware.

4. Identification: Lettering complying with authorities having jurisdiction for letter style, size, spacing, and location.

2.13 FIRE DEPARTMENT CONNECTIONS

A. Manufacturers:

1. AFAC Inc.

2. Central Sprinkler Corp.

3. Elkhart Brass Mfg. Co., Inc.

4. Fire-End and Croker Corp.

5. Fire Protection Products, Inc.

6. GMR International Equipment Corporation.

7. Guardian Fire Equipment Incorporated.

8. Potter-Roemer; Fire-Protection Div.

9. Reliable Automatic Sprinkler Co., Inc.

10. United Brass Works, Inc.

B. [Conventional Wall-Type, Fire Department Connection: UL 405, [175/300]pounds per square inch gauge minimum pressure rating; with corrosion-resitant-metal body with brass chrome plated inlets, brass wall chrome plated escutcheon plate, plastic plugs with metal chain , unless locking caps are required, and brass lugged swivel connections. Inlets must include:]

1. [National Fire Hose (NH) threads according to NFPA 1963 and matching the AHJ Fire Department threads.]

2. [Outlets with pipe threads and extension pipe nipples for each inlet.]

3. [Check devices or clappers for inlets.]

4. [When required by the AHJ, escutcheon plate with raised letters at least 1-inch in size with marking similar to "STATION AUTO SPKR" and "STANDPIPE" or similar as a part of the nameplate.]

C. [Conventional Freestanding type, Fire Department Connection: UL 405, [175/300] pound per square inch gauge minimum pressure rating, with brass or painted (black) ductile iron body, brass snoots attached with thread locker, and threaded plastic plugs with metal chain unless locking caps are required by the AHJ. A welded and hot-dipped galvanized steel manifold is permitted with welding certificate and pressure test certificate. Inlets must include:]

1. [National Fire Hose (NH) threads according to NFPA 1963 and matching the AHJ Fire Department threads.]

2. [Outlets with pipe threads and extension pipe nipples for each inlet.]

3. [Check devices or clappers for inlets.]

D. [When required by the AHJ, escutcheon plate with raised letters at least 1-inch in size with marking similar to "AUTO SPKR" and "STANDPIPE" or similar as a part of the nameplate.] [Storz Type Fire Department Connection: Wall or freestanding as indicated in drawings, UL Listed, 250 PSI, rated forged T6160 aluminum adaptor with silver powder coat finish, red identification plate, nitrile gasket, and rocker lug outlet. Inlets must include:]

1. [4-inch / 5inch Storz connection inlet with Fe NPT threads.]

Designer: determine the correct size and threads by inquiring with the AHJ.

2. [Cap with weep hole and corrosion resistant chain or Storz locking cap when required by the AHJ.]

E. Signage must be provided at each FDC, complying with Sound Transit and AHJ requirements. Signage must be aluminum or corrosion-resistant steel with UV resistant paint/coating, red background with 1-inchtall white lettering unless required to be otherwise by the local AHJ. Signs must indicate the following at a minimum:

1. System Type.

2. Area served including street, station, or other geographical reference for guideway standpipes.

3. Pumping zones and associated fire hose valve numbers for guideway standpipe systems with multiple zones.

4. Required FDC inlet pressure, and flow if required by the AHJ, for systems with an inlet pressure greater than 175 PSI.

5. FDC identification tag if allowed by the AHJ. Otherwise provide a separate sign (black with white letters).

6. Signs must be fastened to a nearby wall or other flat surface using corrosion resistant fasteners. A corrosion resistant bracket may be used to mount to the freestanding FDC when no other nearby flat surface is available.

F. See Division 10 of the specifications for AHJ required door and room signage by others.

G. FDC Specifics:

1. See below for Inlet and Outlet requirements per jurisdiction.

Designer: Please list specific requirements for each AHJ including type, orientation, outlet angle, height above grade, finish, locking caps (if required), etc.

2.14 [FIRE PUMP]

Designer: revise and expand this section as needed for the specific project. A preliminary hydraulic analysis must be conducted to inform the basis of design. Coordinate design with the electrical consultant.

A. [Provide horizontal split-case or vertical inline fire pump with electric motor drive and all associated components and materials (jockey pump, pump controllers, power transfer switch, test meter, and test header in accordance with the IFC and NFPA 20. Fire pump must be selected by design-build contractor to meet the hydraulically most remote fire sprinkler system requirements, with preliminary basis of design as noted below. Contractor must conform to NFPA-20 in its entirety including testing/commissioning:]

1. [### gpm at ## psi pressure boost (Basis of Design).]

2. [Test header with external hose connections. Test loops are not allowed.]

3. [UL Listed/FM Global Approved.}

4. [Commission fire pump & associated equipment in accordance with NFPA 20 Chapter 14 & Section 21 08 00 – Commissioning of Fire Suppression.]

B. [Manufacturers:]

1. [Patterson.]

2. [Peerless.]

3. [Aurora.]

4. [AC Pump.]

C. [Fire pump controllers must meet the following specifications:]

1. [Controllers must be installed within a freestanding NEMA 2 type enclosure and have a withstand rating of 100,000 RMS symmetrical amperes @ ### volts.]

2. [The controller must include a motor rated combination isolating switch and circuit breaker, mechanically interlocked and operated with a single externally mounted handle.]

3. [The isolating switch must be rated to disconnect the motor load.]

4. [The isolating switch/circuit breaker combination must be mechanically interlocked such that the enclosure door cannot be opened when the handle is in the 'on' position except by a tool operated defeater mechanism.]

5. [The controller must include an integral automatic power transfer switch within a separate compartment of the controller which is rated for no less than 115 percent of the motor full-load current. The transfer switch must be mechanically and electrically interlocked so that it is not possible for the pump to be connected to both normal and emergency power at the same time.]

6. [A Soft Start or Wye Delta Closed fire pump controller must be provided.]

D. [Fire Alarm Monitoring:]

1. [Provide valve tamper switches and controller contacts for the following:]

a. [Valve supervision.]

b. [Controller - connected to alternate power source supervisory alarm.]

c. [Controller - Auto/off/manual supervisory alarm.]

d. [Controller – trouble alarm.

e. [Controller - Fire pump running.]

2.15 ALARM DEVICES

A. Alarm-device types must match piping and equipment connections.

B. Electric Bell or Equal: UL 464, with two sets of contacts, red finish, 24VDC powered by FACP. Provide a bell unless the AHJ requires a different device:

1. Manufacturers:

a. ASC Engineered Solutions.

b. FPPI.

c. Potter Electric Signal Company.

d. System Sensor.

e. Reliable Automatic Sprinkler Co., Inc.

f. Viking Corp.

C. Water-Flow Indicator – Paddle Type: UL 346, electrical-supervision, paddle-operated-type, water-flow detector with 250 pounds per square inch gauge pressure rating and designed for horizontal or vertical installation. Include two single-pole, double-throw circuit switches for isolated alarm and auxiliary contacts, 7 A, 125-volt AC and 0.25 A, 24-volt DC;

complete with factory-set, field-adjustable retard element to prevent false signals and tamperproof cover that sends signal if removed.

1. Manufacturers:

   a. ADT Security Services, Inc.

   b. Grinnell Fire Protection.

   c. ITT McDonnell & Miller.

   d. Potter Electric Signal Company.

   e. System Sensor.

   f. Viking Corp.

   g. Watts Industries, Inc.; Water Products Div.

D. Water-Flow Indicator – Pressure Switch Type: UL 346, electrically supervised, pressure activated. Include two single-pole, double-throw circuit switches for isolated alarm and auxiliary contacts:

1. Manufacturers:

   a. Grinnell Fire Protection.

   b. Potter Electric Signal Company.

   c. System Sensor.

   d. Viking Corp.

E. Valve Supervisory Switch: UL 753, electrical, single-pole, double-throw switch with normally closed contacts. Include design that signals controlled valve is in other than fully open position:

1. Manufacturers:

   a. McWane, Inc.; Kennedy Valve Div.

   b. Potter Electric Signal Company.

   c. System Sensor.

2.16 PRESSURE GAUGES

A. Manufacturers:

1. AGF Manufacturing Co.

2. AMETEK, Inc.; U.S. Gauge.

3. Brecco Corporation.

4. Dresser Equipment Group; Instrument Div.

5. Marsh Bellofram.

6. WIKA Instrument Corporation.

B. Description: UL 393, 3-1/2- to 4-1/2-inch diameter, dial pressure gage with range of 0 to 250 pounds per square inch gauge minimum:

1. Water System Piping: Liquid-filled, Include caption "WATER" or "AIR/WATER" on dial face.

2. Air System Piping: Include retard feature and caption "AIR" or "AIR/WATER" on dial face.

2.17 EXPANSION/SEISMIC JOINT ASSEMBLY

A. Provide listed piping expansion joint sufficient to accommodate anticipated expansion or seismic movement or provide sufficient flexible couplings at structural expansion joints to accommodate anticipated movement:

1. Expansion joint assembly utilized along guideway must not conflict with the light rail vehicle dynamic clearance envelope.

2. Expansion joints and seismic joints used in dry-pipe sprinkler systems and dry-standpipes system must not trap water or require access to a dedicated/integral drain point for drainage. Provide products that do not trap water in the installed configuration.

3. Ensure material separation for corrosion control.

4. Ensure equipment pressure ratings exceed the maximum system working pressure.

5. Coupling material must match piping material unless dissimilar material isolation kits are provided.

6. Expansion/seismic joint assembly must be internally and externally coated for corrosion resistance. Where located within unconditioned spaces, exterior surface coating must be installed with a factory-installed, UV-stable, and weather-resistant coating. Assemblies must fully drain if used for dry-pipe sprinkler systems or dry standpipes.

7. Systems using multiple flexible coupling in series are permitted for horizontal standpipes but must be provided with a support assembly to control movement and preclude trapping water.

B. Manufacturers:

1. Anvil International.

2. EBAA Iron, inc.

3. Grinnell.

4. GroovJoint.

5. GruvLock.

6. Metraflex.

7. Victaulic.

2.18 HEAT TRACING

A. Provide UL 515A listed heat tracing combined with thermal insulation, fire alarm system monitoring, and connected to permanent power on a dedicated circuit:

1. Supply main as indicated in the drawings.

2. Heat tracing is not permitted for sprinkler branch lines or other applications.

Designer: For large parking garages and other large unheated facilities it is preferred to provide two separate riser rooms located on exterior walls served by separate underground lead ins. Heat tracing will be considered where practical difficulties exist. Please confer with ST SME and indicate where heat tracing will be allowed on the drawings.

PART 3 - EXECUTION

3.01 PIPING APPLICATIONS, GENERAL

A. Install sprinkler systems in accordance with NFPA 13, and NFPA 130 for stations, buildings, and guideways.

B. Install standpipes in accordance with NFPA 14, and NFPA 130 for stations and guideways.

C. Flanges, flanged fittings, unions, nipples, and transition and special fittings with finish and pressure ratings same as or higher than the specified products pressure rating may be used in aboveground applications as shown on Issued for Construction Drawings, subject to approval by the Resident Engineer.

D. Above ground piping between Fire Department Connections and Check Valves: Galvanized, Schedule 40 steel pipe with grooved ends; grooved-end fittings; grooved-end-pipe couplings; and grooved joints.

E. Above ground piping to extend the fire service lead-in to the backflow preventer in the Riser Room inside the building. Ductile iron per Article 2.06, in this specification.

F. Above ground guideway piping between Fire Department Connections and Check Valves: Schedule 10 or Schedule 40 stainless steel pipe or Schedule 40 galvanized steel pipe with grooved ends; grooved-end fittings; grooved-end-pipe couplings; and grooved joints and meet minimum system operational pressures.

G. Underground Service-Entrance Piping and underground fire department connection piping: Ductile-iron pipe and fitting per Article 2.06, in this specification, meeting the requirements of NFPA 24.

H. Underground piping installed under the ballasted guideway must be installed in a sleeve with casing spacers located every 6-8 feet.

I. Piping must be accessible and must not be embedded in concrete structures unless embedment is unavoidable because of architectural or structural requirements. Embedded piping must be provided with adequate access points and must be hydrostatically and pressure tested to 20 psi above the maximum working pressure before the concrete is poured in accordance with NFPA 14.

J. Piping in public areas of stations must not be exposed unless indicated in Issued for Construction Drawings. Any exposed piping must be painted in a color that blends in with the surrounding areas.

K. Flexible coupling may be used for small angular pipe deflections when allowed by the manufacturer to the limit permitted in the product literature reduced by what is needed for thermal expansion and contraction of the pipe. See Submittals and transmittals, Article 1.04, in this specification for required calculations.

L. Holes cut in galvanized piping for mechanical tees must be protected with cold galvanization coating during assembly.

M. Backflow devices must be located so that they may be serviced from the room floor without a portable ladder.

N. Provide fire hose valves downstream of the backflow device to facilitate forward flow testing in accordance with NFPA 25.

3.02 STANDPIPE SYSTEM PIPING APPLICATIONS

A. Guideway:

1. Install standpipe piping pitched at least ¼ inch per 10 feet in accordance with NFPA 14.

2. Arrange piping so that it can be thoroughly drained, as practical at 2-inch main drains located at fire department connections and low point drains accessible from grade. Ball drip valve may be provided to supplement, but not replace manual drain valves.

3. [Locate fire hose valves on the top of the pipe to simplify draining.]

4. Ensure the standpipe systems, valves, supports, and appurtenances do not encroach into the pedestrian envelope or the dynamic envelope of the train.

5. Provide ball drip valves (automatic drains) between fire department connections and check valves.

6. Provide isolation valves every 800 feet in accordance with NFPA 130 and the drawings, unless waived in writing by the AHJ.

7. Different standpipe segments may utilize different piping materials, but consistent pipe, coupling, and fitting materials must be utilized within each segment. Provide dissimilar material kits for expansion joints and other components of dissimilar materials.

8. Grooving tool sets must be the same manufacturer as the grooved components.

9. Grooving roll set are to be specific to stainless steel and for the appropriate pipe schedule for stainless steel pipe applications.

3.03 SPRINKLER SYSTEM PIPING APPLICATIONS

A. Products section and drawings indicate the pipe, fittings, couplings, and joints to use.

3.04 SERVICE ENTRANCE PIPING

A. Connect to the below-ground water source just outside building as shown on Issued for Construction Drawings.

B. Install supervised shutoff valve and pressure gage in each feed ahead of common tee connection, to allow for independent servicing of each water feed for the fire protection system.

C. For the buried pipe entrance(s) into the building, provide adequately sized galvanized sleeve cast in place in the wall and seal annular space between pipe and sleeve using modular rubber sealing unit. Coordinate with the requirements of Sleeve Seals - Specification 21 05 17 and Common Work Results for Fire Suppression - Specification 21 05 00.

D. Provide fire hose valves appropriately arranged for periodic testing of the backflow preventer.

3.05 STANDPIPE COMPONENT INSTALLATION

A. Install the standpipe systems as indicated on Contract Drawings and in accordance with requirements of NFPA 14.

B. Install standpipe piping so that it can be thoroughly drained and, where practicable, arranged to drain at the main drain valves.

C. Provide a 2-inch main drain, as required per NFPA 14 and at FDCs serving elevated guideway manual dry standpipes systems. The valve must be lockable if accessible to the public.

D. Valve accessibility for operation and servicing is required. Install valves as indicated and with no stems located below the horizontal position.

E. Provide a pressure gauge at the top of each standpipe.

F. Provide escutcheon plates at finished surfaces where exposed piping passes through floors, walls, and ceilings. Fasten escutcheons to pipe or pipe coverings.

G. Install listed fire-protection valves, trim and drain valves, specialty valves and trim, controls, and specialties according to NFPA 14, the AHJ Fire Department and drawings.

H. Coordinate the installation of pipes, hangers, valves, and all other items of the fire protection system with the work of all other trades so that all components will be installed to avoid conflicts and provide for proper servicing and maintenance of mechanical and electrical equipment in the ceiling plenums and equipment rooms.

3.06 SPRINKLER PIPING INSTALLATION

A. Refer to the requirements of Common Work Results for Fire Suppression - Specification 21 05 00, for basic piping installation.

B. Locations and Arrangements: Contract Drawing Plans, Schematics, and Diagrams indicate general location and arrangement of piping. Install piping as indicated, to implement the esthetic intent of the Contract Drawings:

1. Deviations from approved Contractor developed working plans for piping will require written approval from the AHJ Fire Department. File written approval with Resident Engineer before deviating from approved working plans.

2. Exposed piping must be installed parallel to or at right angles to the column lines of the building. Springing or forcing piping into place will not be permitted. Install piping in such a manner to prevent strain on the equipment.

C. Install unions adjacent to each valve in pipes NPS 2 and smaller. Unions are not required on flanged devices or in piping installations using grooved joints.

D. Install flanges or flange adapters on valves, apparatus, and equipment having NPS 2-1/2 and larger connections.

E. Install listed fire-protection shutoff valves supervised-open, located to control sources of water supply except from fire department connections. Install permanent identification signs indicating portion of system controlled by each valve.

F. Furnish and install all sleeves and fire proofing as required when penetrating inside walls and floors.

G. Install "Inspector's Test Connections" in sprinkler system piping, complete with shutoff valve, sized and located according to NFPA 13.

H. Drains valves must not be located in, or within 10 feet of the trainway.

Auxiliary drains valves must be located 80 inches above the access point in public areas for garages and 9 feet for stations and remain accessible by portable ladder. Auxiliary drains located in public areas must be equipped with locking valves.

I. Auxiliary drains in secured areas must be located at five feet above the access point.

J. Auxiliary drains and other equipment requiring periodic access for maintenance must not located in the trainway at stations.

K. Route pipe through beam sleeve to eliminate the need for auxiliary drains for beam drops. Install sprinkler piping with drains for complete system drainage. Grade piping to eliminate traps and pockets. Where traps cannot be avoided provide auxiliary drains.

L. Install ball drip valves to drain piping between fire department connections and check valves.

M. Main drains associated with sprinkler systems and semiautomatic standpipe automatic flow (deluge) valves must discharge within the riser room to a sanitary sewer sized to accommodate full flow. Provide a 1-inch air gap between the top of the sanitary sewer from the bottom of the drainpipe.

Designer: Coordinate with civil to provide a 6-inch diameter sanitary sewer with an eight in diameter extension to 24 inches above the floor.

N. Provide 2-inch main drains for guideway standpipe systems in accordance with NFPA 14 and to ensure the system can be fully drained in less than 30 minutes. Automatic drains are not permitted as a substitute for manual drains if trapped water exceeds 10 gallons or produces more than 7 PSI of water pressure. Drains points with both manual and automatic drains are permitted. Manual drains must be readily accessible from grade, or the trainway.

O. Install alarm devices and flow switches in piping systems as indicated on the Issued for Construction Drawings.

P. Wet-pipe risers: Install in vertical position in accordance with NFPA 13.

Q. Install pressure gages on riser or feed main and at each sprinkler test connection. Include pressure gages with connection not less than NPS 1/4 and with soft metal seated globe or ball valve, arranged for draining pipe between gage and valve. Install gages to permit removal without a system shutdown.

R. Coordinate the installation of pipes, hangers, valves, and all other items of the fire protection system with the work of all other trades so that all components will be installed to avoid conflicts and provide for proper servicing and maintenance of mechanical and electrical equipment in the ceiling plenums and equipment rooms.

S. Heat Tracing and insulation for supply mains must be installed in accordance with NFPA 13, UL 515, and IEEE515.1.

T. Sprinkler heads may not be located over the dedicated electrical space of electrical panels as defined by the NEC.

3.07 HANGER AND SUPPORT INSTALLATION

A. Pipe hanger and support installation of the pre-engineered pipe hanger and seismic restraint system must conform to the following:

1. Comply with MSS SP 58. Install hangers, supports, clamps, and attachments as required to properly support piping.

2. Design and space supports as indicated in NFPA 13. Comply with NFPA 13 for hanger material selection. Install additional supports for flow induced thrust and other concentrated loads, including valves, flanges, guides, strainers, and expansion joints, and at changes in direction of piping. Install concrete inserts before concrete is placed; fasten inserts to forms.

3. Install expansion anchors in concrete after concrete is placed and completely cured. Install fasteners according to manufacturer's written instructions.

4. Install hangers and supports and seismic bracing in accordance with NFPA 13 or ASCE -10, complete with necessary inserts, bolts, rods, nuts, washers, and other accessories.

5. Install hangers and supports to allow controlled thermal and seismic movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of flexible couplings, expansion loops, expansion bends, and similar units.

6. Load Distribution: Install hangers and supports so that piping live and dead loads and stresses from movement will not be transmitted to connected equipment.

7. Pipe Slopes: Install hangers and supports to provide indicated pipe slopes and so maximum pipe deflections allowed by ASME B31.9 are not exceeded.

B. Piping hanger, support, and brace installation for guideway dry standpipe must account for the following:

1. Thermal expansion of the piping system over the course of the year. Thermal expansion calculation must assume a temperature range of 0F to 140F which accounts for convective and radiative heat gain, and 0F to 120F for tunnels.

2. Reduction in flexible coupling capacity when using couplings for angular deflection in addition to linear thermal movement.

3. Thrust forces and water hammer forces for the piping and fire department connections.

4. Structural expansion joint and the type of piping expansion joint to be used.

5. Seismic forces.

Designer: For guideway dry standpipe systems, the hangers, supports, and bracing must be determined by the fire protection engineer and structural engineer and detailed sufficiently in the IFC drawings so that the engineering technician may complete the design. The structure used to support the piping (stanchion, fence, retaining wall, and guideway structure) must be evaluated for a complete system.

3.08 CONSTRUCTION

A. Welding:

1. Shop-fabricate all major piping assemblies.

2. Field welding, in general, is not permitted. In specific cases and only with the approval of the Resident Engineer may the Contractor be allowed to field-weld. Submit request to field weld with sufficient proof that no other method is feasible.

3. All welds must have 100 percent penetration and smooth lines of fusion on the exterior and interior. Do not exceed 1/16-inch weld reinforcement.

4. Examine welds as defined in Quality Assurance (item 2.05 in this specification).

B. Galvanized Pipe and Surfaces:

1. Shop welding must occur before hot-dipped galvanized pipe for sub-assemblies required to be galvanized. Mechanical tees are permitted for galvanized guideway standpipe systems as indicated in this specification in Products. Apply galvanizing-repair paint at cut-out holes.

2. Where field welding is permitted, clean welds, bolted connections, field cut grooved pipe, and abraded areas on galvanized pipe and apply galvanizing-repair paint as required by the Contract. Repairs must be made in accordance with ASTM A780/A780M

3.09 SPRINKLER APPLICATIONS

A. Drawings indicate sprinkler types to be used. Where specific types are not indicated, use the following sprinkler types, in accordance with NFPA 13, AHJ Fire Department, and approved shop drawings and pipeline layout drawing submitted in accordance with Article 1.06, in this specification:

1. Rooms without Ceilings: Upright sprinklers.

2. Rooms with Suspended Ceilings: Pendent sprinklers.

3. Wall Mounting: Sidewall sprinklers.

4. Sprinkler Finishes:

a. Upright, Pendent, and Sidewall Sprinklers: Chrome plated in finished spaces exposed to view; rough brass in unfinished spaces not exposed to view; wax coated where exposed to acids, chemicals, or other corrosive fumes.

b. Concealed Sprinklers: Rough brass, with factory-painted white cover plate.

c. Flush Sprinklers: Bright chrome, with painted white escutcheon.

d. Recessed Sprinklers: Bright chrome, with bright chrome escutcheon.

3.10 SPRINKLER INSTALLATION

A. Install sprinklers in suspended ceilings in center of narrow dimension of acoustical ceiling panels and tiles and at ¼ intervals for the long dimension. Architectural sensitive areas are shown on Issued for Construction Drawings including the Architectural reflected ceiling plans.

B. Areas subject to freezing:

1. Provide upright sprinkler or dry-type pendant or sidewall sprinklers for dry-pipe systems.

2. Where possible provide dry type heads connected to wet-pipe sprinklers to protect canopies and roof projections, where required.

Designer: Indicate where dry type heads are expected on the IFC drawings for clarity.

3. Provide pendant sprinklers on return bends in accordance with NFPA 13 for dry-pipe systems in heated rooms with ceilings when installed.

Designer: The use of return bends should be noted on the drawing to clarify a separate wet-pipe system is not required when the aggregate area of heated space is small (< 2,000 sf per FLS Set 601 and it is possible effectively drain the system).

4. Heat tracing is not permitted for sprinkler system mains and branch lines.

3.11 HOSE-CONNECTION INSTALLATION

A. Install hose connections adjacent to standpipes, unless otherwise indicated.

B. Freestanding hose connections must be installed to maintain access and minimum passage restriction.

C. Install hose-connection valves without flow-restricting device, unless otherwise indicated.

D. Install wall-mounting-type hose connections in cabinets as required in Specification 10 44 00 - Fire Protection Specialties and Issued for Construction Drawings. Include pipe escutcheons, with finish matching valves, inside cabinet where water-supply piping penetrates cabinets. Install valves at angle required for connection of fire hose in accordance with NFPA14 and as required by the local AHJ.

3.12 FIRE DEPARTMENT CONNECTION INSTALLATION

A. Install wall-type, fire department connections in vertical wall, or free standing, as shown on Issued for Construction Drawings.

B. Install ball drip valve at each check valve for fire department connection.

C. Where FDC system piping connection is grooved joint type, locate the mechanical coupling at least 12 feet above grade to prevent theft and use a threaded connection to brass FDC manifold, where brass manifolds are used.

3.13 CONNECTIONS

A. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to equipment to allow service and maintenance.

C. Connect water-supply piping to fire-suppression piping. Include backflow preventer between potable-water piping and fire-suppression piping. Refer to Water and Utility Distribution Pipe – Specification 33 11 00 and Issued for Construction Drawings.

D. Route 2-inch main drains from wet-pipe-dry-pipe, preaction, and deluge valves to a 30-inch high 8-inch diameter steel funnel drain connected to a 6-inch sanitary server. Provide a 1-inch air gap between the top of the funnel drain and the bottom of the 2-inch drain. Gang all drains together to serve multiple low points.

E. Connect piping to specialty valves, hose valves, specialties, fire department connections, and accessories.

F. Electrical Connections: Power wiring is specified in the requirements of low-voltage electrical power conductors and cables in the Contract.

G. Connect alarm devices to fire alarm.

H. Ground equipment according to the requirements of grounding and bonding for electrical systems as required by the Contract.

I. Connect wiring according to the requirements of low-voltage electrical power conductors and cables as stated in the Contract.

3.14 LABELING AND IDENTIFICATION

A. Comply with the requirements of mechanical identification as stated in the Contract.

B. Install labeling and pipe markers on equipment and piping according to requirements in NFPA 13 and NFPA 14 as required by the Contract..

C. All signage and labels must be secured with fasteners, adhesive, or other approved means as outlined in this specification and as required by the Contract.

D. All signs exposed to moisture, varying temperatures and sunlight must be designed to perform in the environment.

E. Valve/Equipment Labels:

1. Label Content:

a. Include equipment's Issued for Construction Drawing designation or unique equipment number, Contract Drawing numbers where equipment is indicated (plans, details, and schedules).

b. Information indicating the type of valve or equipment, and area served, when fire department interface is expected and when required by codes and standards.

2. Material and Thickness: Multilayer, multicolor, phenolic engraved white lettering on red background, 1/8 inch thick, and having predrilled holes for attachment hardware if the label is to be mounted with fasteners.

3. Identification: Provide a unique identifying number complying with Sound Transit standards and requirements.

4. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 inches by 3/4 inch.

5. Minimum Letter Size: 1 inch and proportionately larger lettering for greater viewing distances. Include secondary lettering (e.g., identification number) two-thirds to three-fourths the size of principal lettering.

6. Fasteners: Stainless-steel rivets or stainless-steel self-tapping screws.

7. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate

F. Valve/equipment labels must be provided for equipment scheduled in the basis of design drawings and the following:

1. Fire Protection Control, Lead In, Segment, and Isolation Valves.

2. Fire Hose Valves.

3. Dry-Pipe, Preaction and Deluge Valves.

4. Alarm Valves associated with Wet-Pipe Systems.

5. Check Valves.

6. Guideway Expansion Joints.

7. Backflow Preventers.

8. Air Compressor.

9. Air Dryers.

10. Air Release / Vacuum Valves.

G. Drain Valve Signs: Provide signs for main drains, auxiliary drains, and automatic drains in accordance with NFPA 13 and NFPA 14. Signs must be aluminum with red background and white letters and may be hung using wire seal or beaded metal chains, or equal as acceptable to the ST specification owner. ST identification numbering is not required for these valves and other trim valves.

H. Hydraulic Information Signs: Provide a hydraulically design information sign in accordance with NFPA 13:

1. Such signs must be placed at the alarm valve, dry pipe valve, preaction valve, or deluge valve supplying the corresponding hydraulically designed area.

2. Signs must be aluminum with laser engraved data.

3. Secure to the system riser.

I. Information Sign: The installing contractor must provide an information sign, or document box, in accordance with NFPA 25:

1. Such signs must include location of the area served, location or auxiliary drains and low-point drains, the presence of heat trace, and other information as required, and be placed at each system control riser. Signs must be aluminum or rigid phenolic plastic with aluminum backing. Document box must accommodate a binder for 8.5x11-inch paper.

J. Fire Department Connection Signs: Signage must be provided at each FDC, complying with Sound Transit and AHJ requirements. Signage must be 10-gauge aluminum sheet metal with 3M Diamond Grade DG reflective sheeting, ASTM Type XI with pre-drilled holes, or equal as acceptable to the ST specification owner. FDC Signs must have red background with minimum 1-inch-tall white lettering unless required to be otherwise by the local AHJ. Signs must indicate the following at a minimum:

1. System Type.

2. Area served including street, station, or other geographical reference for guideway standpipes.

3. Pumping zones and associated fire hose valve numbers for guideway standpipe systems with multiple zones.

4. Required FDC inlet pressure, and flow if required by the AHJ, for systems with an inlet pressure greater than 175 PSI.

5. FDC identification tag if allowed by the AHJ. Otherwise provide a separate sign (black with white letters).

6. Signs must be fastened to a nearby wall or other flat surface using corrosion resistant fasteners. A corrosion resistant bracket may be used to mount to the freestanding FDC when no other nearby flat surface is available.

Designer: The FDC signs outlined above are to be specified for all systems including guideway standpipe systems. Engraved metal signs may substitute for these signs at architecturally sensitive locations at stations when approved by the AHJ. Coordinate with architect to determine the need for architecturally sensitive signs.

K. Fire Hose Cabinets Signs: Identify fire hose cabinets with lettering not less than 1 inches high (2-inch high for cabinets without vision panels) with the ST equipment identification number at ½ inch. If a sign is provided for the cabinet, one is not needed for the valve.

L. All signage, tags, and labeling must be reviewed and approved by Sound Transit and the local AHJ prior to fabrication or installation. See submittal requirements.

3.15 VALVE LIST

A. For guideway standpipe system provide a valve list to be used as a fire department reference in fire command centers and fire control rooms. The list must include fire hose valve and sectional valves. Specific information for each valve must include standpipe segment number, ST valve identification number, trainway mileage marker, mileage distance and note that indicates associated FDCs.

3.16 PAINTING

A. Prepare piping system to be free from grease, oil, rust, and scale, and make ready for the application of paint in compliance with the requirements of painting and coating as required by the Contact. Provide protective covering to keep paint away from the sprinkler heads.

3.17 FIELD QUALITY CONTROL

A. Flushing of Piping: Underground mains and lead in connections to system risers must be completely flushed before connection is made to sprinkler and standpipe piping. The minimum rate of flow must not be less than that indicated in NFPA 13. All flushing water must be dechlorinated and disposed of in a manner acceptable to the Resident Engineer.

B. Testing (General):

1. Testing outlined within this Section are required regardless of testing required by the AHJ. Any AHJ requirements must be in addition to these requirements.

2. Perform 100 percent visual inspection of completed system.

3. Contractor must provide and dispose of the quantity of water necessary for testing.

4. Test installed systems and products hydrostatically, using testing instruments calibrated by an Independent Testing Laboratory in accordance with quality assurance/quality control requirements as required by the contract. Repair leaks and retest the system.

a. Test standpipe hydrostatically for two hours without loss in pressure, using the most convenient outlet connection. The test pressures for the standpipe system are as follows:

1) Minimum 200 pounds per square inch gauge test pressure or 50 pounds per square inch in excess of the maximum working pressure (whichever is greater) that must be maintained without loss for two hours.

2) The guideway standpipe must be tested with the following pressures at the high point of the system:

a) Minimum 200 pounds per square inch gauge test pressure or 50 pounds per square inch in excess of the maximum working pressure (whichever is greater) that must be maintained without loss for two hours.

b. Test all sprinkler system piping and appurtenances subject to system working pressure using a minimum 200 pounds per square inch gauge test pressure or 50 pounds per square inch in excess of the maximum working pressure (whichever is greater) that must be maintained without loss for two hours.

c. In addition to the hydrostatic tests, the dry system will be subjected to an air pressure leakage test for 24 hours using 40 pounds per square inch gauge air with less than 1-1/2 pounds per square inch loss over the test period.

d. After testing, confirm system can be completely drains using main drains, auxiliary drains, and fire hose valves where allowed to be used as a drain.

e. Place system into service for final acceptance when systems are operational or when directed by the Resident Engineer.

5. Conduct [garage, OMF] standpipe system flow test(s) in accordance with NFPA 14 including but not limited to the following:

   a. Standpipe Systems: Flow 250 gallons per minute from each of the two (2) most remote hose valves in the most remote stairwell and 250 gpm at each additional stairwell, up to a maximum of 1,000 gpm with an outlet pressure of [100 psi] to verify residual pressure(s) with pumper truck assist. The contractor must provide a pump, hoses, dichlorination equipment and other necessary equipment for this test.

6. Conduct guideway, station, and garage standpipe system fill-time test and flow test(s) in accordance with NFPA 14, NFPA 130, and additional criteria outlined in Letters of Concurrence and other agreements. The contractor must provide a pump, hoses, dichlorination equipment and other necessary equipment for this test:

   a. Fill-time test (Dry and semi-automatic systems only): The flow test must be conducted at the design fill rate (used to calculate fill time) to confirm the fill time meets NFPA 130 and to demonstrate air release valve performance and resistance from thrust forces and water hammer.

   b. Flow test: Pump the system to the design inlet pressure (greatest pressure for multiple zone systems) and measure water flow and residual pressure at the remote fire hose valves. The number of hose valves must be based up the design criteria. Confirm complete drainage may be achieved by opening main and auxiliary drains following this test. Garage and open station flow test are not required if formally waived by the AHJ as outlined in NFPA 14.

   c. [Tunnel automatic flow control (deluge) valve: Test the function of the semi-automatic standpipe automatic fill valve as with a mode launch.]

   Designer: The fill time using the automatic valve is not required by ST but may be required by the AHJ, please determine requirement and revise this Section as needed.

C. Perform tests in the presence of the Resident Engineer and AHJ Fire Department. Give 48-hour notice prior to test and notify the AHJ Fire Department and AHJ Utilities Department. The Resident Engineer will review certificates and test reports, and will inspect the standpipe and sprinkler system to verify conformance with Standards and other References in the Specifications including NFPA 130, NFPA 14 and NFPA 13.

3.18 TRAINING

A. Engage a factory-authorized service representative to train Sound Transit's maintenance personnel to adjust, operate, and maintain water-based fire suppression systems and equipment.

3.19 COMMISSIONING

A. Testing outlined above must be accounted for in commissioning procedures and test records when commissioning is included in the contract.

END OF SECTION

SECTION 22 05 00

COMMON WORK RESULTS FOR PLUMBING

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for materials and installation common to most piping systems including dielectric fittings, mechanical sleeve seals, sleeves, escutcheons, grout, equipment, concrete bases, and supports and anchorages.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. American Society of Mechanical Engineers (ASME):

a. ASME B1.20.1 Pipe Threads, General Purpose (Inch).

2. ASTM International (ASTM):

a. ASTM B32 Standard Specification for Solder Metal.

b. ASTM B813 Standard Specification for Liquid and Paste Fluxes for Soldering of Copper and Copper Alloy Tube.

c. ASTM B828 Standard Practice for Making Capillary Joints by Soldering of Copper and Copper Alloy Tube and Fittings.

d. ASTM C1107 Standard Specification for Packaged Dry, Hydraulic-Cement Grout (Nonshrink).

e. ASTM D2261 Standard Test Method for Tearing Strength of Fabrics by the Tongue (Single Rip) Procedure (Constant-Rate-of-Extension Tensile Testing Machine).

3. American Welding Society (AWS):

a. AWS A5.8 Specification for Filler Metals for Brazing and Braze Welding.

b. AWS D1.1 Errata for Structural Welding Code – Steel.

c. AWS D10.12 Guide for Welding Mild Steel Pipe.

B. Definitions:

1. Finished Spaces: Spaces other than plumbing and electrical equipment rooms, furred spaces, pipe chases, unheated spaces immediately below roof, spaces above ceilings, unexcavated spaces, crawlspaces, and tunnels.

2. Exposed, Interior Installations: Exposed to view indoors. Examples include finished occupied spaces and plumbing equipment rooms.

3. Exposed, Exterior Installations: Exposed to view outdoors or subject to outdoor ambient temperatures and weather conditions. Examples include rooftop locations.

4. Concealed, Interior Installations: Concealed from view and protected from physical contact by building occupants. Examples include above ceilings and in chases.

5. Concealed, Exterior Installations: Concealed from view and protected from weather conditions and physical contact by building occupants but subject to outdoor ambient temperatures. Examples include installations within unheated shelters

1.03 SUBMITTALS

A. Submit:

1. Provide as-built drawings of all building plans in accordance to Division 01 As-Built Documents specification. As-Built drawings shall include as a minimum the location and performance data on each piece of equipment, general configuration of pipe distribution system, including sizes, and water design flow rates of the actual installation. As-Built drawings shall also incorporate any mechanical work which deviates from the contract drawings, including changes resulting from addenda, Requests for Information, and Change Orders. Neatly draft changes on clean “hard copy” drawings to show the work clearly in the actual locations as built.

a. Operating Instructions:

1) Provide operating and maintenance instructions in accordance with Division 01 Operation and Maintenance Data specification. The training of the appropriate maintenance staff for each equipment type and/or system shall include, as a minimum, the following.

2) System/Equipment overview (what it is, what it does and which other systems and/or equipment does it interface with).

3) Review of the available operations and maintenance (O&M) materials in accordance with Division 01 Operation and Maintenance Data specification.

4) Review of the Record Drawings on the subject system/equipment, including valve schedules and zone distribution.

5) Hands-on demonstration of all normal maintenance procedures, normal operating modes, and all emergency shutdown and startup procedures.

B. Transmit:

1. Drawings:

a. Drawings are diagrammatic, indicating the general arrangement of systems and work. Examine the architectural drawings for exact location of fixtures and equipment. Where they are not definitely located, obtain this information from the Resident Engineer.

1) Follow drawings in laying out work and check drawings of other trades to verify spaces in which work will be installed. Maintain maximum headroom. If space conditions appear inadequate, notify the Resident Engineer before proceeding with the work.

Make reasonable modifications in the work without extra cost as needed to prevent conflict with work of other trades and for proper execution of the work.

2. Product Data: For each type of product indicated.

3. Fire Department Connection, sign layout drawings for each location.

4. Emergency Tunnel Ventilation System Equipment, sign schedule and layout drawings.

5. Documentation.

1.04 QUALITY ASSURANCE

A. Material and Work:

1. Materials and equipment required for the work shall be new and shall be furnished, delivered, erected, installed, connected, and finished in every detail; and shall be selected and arranged to fit properly into the building spaces. Where no specific kind or quality of material is given, an article as approved by the Resident Engineer shall be provided.

2. Furnish the services of an experienced superintendent, who shall be constantly in charge of the work.

B. Coordination:

1. Provide control and electrical wiring details including power supply connections for any dry systems requiring power and control or any electrically activated valves that require interface with control systems.

2. Drawings are diagrammatic, indicating the general arrangement of systems and work. Examine the architectural drawings for exact location of fixtures and equipment. Where they are not definitely located, obtain this information from the Resident Engineer:

    a. Follow drawings in laying out work and check drawings of other trades to verify spaces in which work will be installed. Maintain maximum headroom. If space conditions appear inadequate, notify the Resident Engineer before proceeding with the work. Make reasonable modifications in the work without extra cost as needed to prevent conflict with work of other trades and for proper execution of the work.

C. Cooperation with other trades:

1. Give full cooperation to other tradesand furnish in writing to other trades, with copies to the Resident Engineer, any information necessary to permit the work of all trades to be installed satisfactorily and with the least possible interference or delay.

2. Plumbing contractor must inspect and accept the installation work area and furnish in writing to the prime contractor with copies to Resident Engineer prior to starting the installation work.

3. Where plumbing work will be installed in close proximity to, or will interfere with work of other trades, assist in working out space conditions to make a satisfactory adjustment. If work is installed before coordinating with other trades, or if it causes any interference with work of other trades, make the necessary changes in the work to correct the conditions and bear all costs.

4. Furnish to other trades necessary templates, patterns, setting drawings and shop details for the proper installation of work and for coordinating adjacent work. This includes participation and support of any Building Information Modeling efforts associated with this contract.

D. Record Documentation:

1. As-built drawings shall include as a minimum the location and performance data on each piece of equipment, general configuration of pipe distribution system, including sizes, and water design flow rates of the actual installation. As-built drawings shall also incorporate any mechanical work which deviates from the contract drawings, including changes resulting from addenda, Requests for Information, and Change Orders. Neatly draft changes on clean “hard copy” drawings to show the work clearly in the actual locations as built.

E. Operating Instructions:

1. Provide operating and maintenance instructions in accordance with Specification Section 01 78 23 Operation and Maintenance Data

a. System/Equipment overview (what it is, what it does and which other systems and/or equipment does it interface with).

b. Review of the available operations and maintenance (O&M) materials in accordance with Specification Section 01 78 23 Operation and Maintenance Data.

c. Review of the Record Drawings on the subject system/equipment, including valve schedules and zone distribution.

d. Hands-on demonstration of all normal maintenance procedures, normal operating modes, and all emergency shutdown and startup procedures.

1.05 DELIVERY, STORAGE AND HANDLING

A. Deliver pipes and tubes with factory-applied end caps. Maintain end caps through shipping, storage and handling to prevent pipe end damage and to prevent entrance of dirt, debris, and moisture.

B. Store plastics pipes away from direct sunlight. Support to prevent sagging and bending.

C. Accessibility:

1. Install the work with adequate clearances throughout the project, including being responsible for the sufficiency of the size of shafts, chases, double partitions, and suspended ceilings. Cooperate with other trades where work is in the same space. Such spaces and clearances shall be kept to the minimum size required.

2. Locate all equipment that must be serviced, operated, or maintained in fully accessible positions.

3. The Fire Protection Subcontractor shall provide the General Contractor the exact locations of access panels for each concealed valve, or other device requiring service. Access panels will be provided and installed by the General Contractor and as specified in the other divisions of the specifications. Submit locations of these panels to the General Contractor in sufficient time to be installed in the normal course of work.

1.06 PROJECT CONDITIONS

A. Cutting and patching:

1. Provide drilling, coring, cutting, and patching necessary to install the work specified in this division. Patching shall match adjacent surfaces.

2. No structural members shall be cut without the approval of the Resident Engineer, and cutting shall be done in a manner directed by them. Do not damage or endanger any portion of the project or work of the Owner or any other separate contractor by drilling, coring, cutting, patching, excavating, and backfilling.

3. Inform the General Contractor and other subcontractors affected of requirements for cutting and patching.

B. Boxes, Sleeves and Chases:

1. Inform the General Contractor of requirements for boxes, sleeves, and chases. The General Contractor shall set boxes, sleeves, and chases. Furnish General Contractor with the boxes and sleeves and be responsible for informing General Contractor of required location.

1.07 WARRANTY

A. All work, materials, and equipment to be free from defects as required in Division 00 Procurement and Contracting Requirements.

B. The warranty disregards shorter time limits by any manufacturer of equipment provided.

C. Make all necessary adjustments and corrections during first year of operation. The fact that the Resident Engineer was present during any construction does not relieve the Contractor from responsibility for defects discovered after completion of the work.

PART 2 - PRODUCTS

2.01 MANUFACTURED PRODUCTS

A. Joining Materials:

1. Manufacturers:

a. Capital Manufacturing Co.

b. Central Plastics Company.

c. Watts Industries Inc. Water Products Div.

d. Zurin Industries, Inc. Wilkins Div.

e. Or approved equal.

2. Description:

a. Fittings are to be the same size and compatible with the piping to be joined. Pressure rating for fittings shall at least be equal to the piping that is to be joined.

3. Materials:

a. Unless indicated otherwise the following shall be used as joining materials for plumbing work:

1) Pipe-Flange Gasket Materials: nonmetallic, flat, asbestos-free, 1/8-inch maximum thickness unless thickness or specific material is indicated.

2) See other sections for isolating flange gasket kits.

3) Plastic, Pipe-Flange Gasket, Bolts, and Nuts: Type and material recommended by piping system manufacturer, unless otherwise indicated.

4) Solder Filler Metals: lead-free alloys.

5) Brazing Filler Metals: BCuP Series or BAg1, unless otherwise indicated

6) Solvent Cements for Joining Plastic Piping

a) CPVC Piping: ASTM F493

b) PVC Piping: ASTM D2564. Include primer according to ASTM F656

B. Dielectric Fittings:

1. Description:

a. Combination fitting of copper alloy and ferrous materials with threaded, solder-joint, plain, or weld-neck end connections that match piping system materials.

2. Performance:

a. Dielectric Unions: Factory-fabricated, union assembly, for 250-psig minimum working pressure at 180 degrees F.

b. Dielectric Unions: Factory-fabricated, union assembly, for 250-psig minimum working pressure at 180 degrees F.

c. Dielectric Flanges: Factory-fabricated, companion-flange assembly, for 300-psig minimum working pressure as required to suit system pressures.

d. Dielectric Couplings: Galvanized-steel coupling with inert and noncorrosive, thermoplastic lining; threaded ends; and 300-psig minimum working pressure at 225 degrees F.

e. Dielectric Nipples: Electroplated steel nipple with inert and noncorrosive, thermoplastic lining; plain, threaded, or grooved ends; and 300-psig minimum working pressure at 225 degrees F.

3. Insulating Material :

a. Suitable for system fluid, pressure, and temperature.

C. Floor Plates:

1. Description:

a. One-Piece Floor Plates: Cast iron flange with holes for fasteners.

D. Flexible Expansion Joint:

1. Description for Vent and Roof Drain Pipe Flexible Expansion Joint:

a. Flexible loop capable of 4-inches movement in three planes and consisting of two flexible sections of hose and stainless steel braid, two 90-degree bends and one 180-degree return bend with hanger support nut and drain/air release plug. Provide MetraFlex Metraloop or equal.

b. Performance:

1) 150 psi rated.

2. Description for Domestic Hot and Cold Water Pipe Flexible Expansion Joint:

a. Flexible loop capable of 4-inches movement in three planes and consisting of two flexible sections of bronze hose and braid, two 90-degree bends and one 180-degree return bend with hanger support nut and drain/air release plug. Provide MetraFlex Metraloop or equal.

b. Comply with state codes and standards, where applicable, requiring reduced lead content.

c. Performance:

1) 150 psi rated at 70 degrees F.

E. Access Panels:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. Croker FRP.

b. Mifab.

2. Description:

a. Manufactured stainless steel access panel to provide access to utilities in walls and ceilings.

b. Dimensions: Scheduled.

3. Assembly or Fabrication:

a. Continuous hinge with universal latch. Material shall be minimum 16-gauge door and frame and shall be listed for fire rated applications

PART 3 - EXECUTION

3.01 INSTALLATION

A. Piping Systems:

1. Contract Drawing, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design

considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.

2. Install piping in concealed locations, unless otherwise indicated and except in equipment rooms and service areas.

3. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

4. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

5. Install piping to permit valve servicing.

6. Install piping at indicated slopes.

7. Install piping free of sags and bends.

8. Install fittings for changes in direction and branch connections.

9. Install piping to allow application of insulation, when applicable.

10. Select system components with pressure rating equal to or greater than system operating pressure.

11. Install escutcheons for penetrations of finished walls, ceilings, and floors.

12. Install floor plates for piping penetrations of equipment-room floors. Install floor plates with ID to closely fit around pipe, tube, and insulation of piping and with OD that completely covers opening.

13. Verify final equipment locations for roughing-in.

14. Install flexible expansion joints where indicated on drawings and where piping crosses building seismic joints. Install vertical support hanger within 4 pipe diameters on each side of the flexible joints and seismic joint. Brace each hanger longitudinally and transversely. Install vertical support at 180-degree return bend.

B. Equipment:

1. Install equipment to allow maximum possible headroom unless specific mounting heights are not indicated.

2. Install equipment level and plumb, parallel and perpendicular to other building systems and components in exposed interior spaces, unless otherwise indicated.

3. Install plumbing equipment to facilitate service, maintenance, and repair or replacement of components. Connect equipment for ease of disconnecting, with minimum interference to other installations. Extend grease fittings to accessible locations.

4. Install equipment to allow right of way for piping installed at required slope.

C. Construction:

1. Join pipe and fittings according to the following requirements.

2. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

3. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly:

   a. Threaded Joints: Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:

      1) Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.

      2) Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged.

4. Soldered Joints: Apply water-flushable flux, unless otherwise indicated, to tube end. Construct joints using lead-free solder alloy.

5. Brazed Joints: Construct joints using copper-phosphorus brazing filler metal.

6. Welded Joints: Construct joints according to AWS D10.12, using qualified processes and welding operators according to Part 1 "Quality Assurance" Article:

   a. Damaged Threads: Do not use pipe sections that have cracked or open welds.

7. Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.

D. Pipe Connections: Make connections according to the following, unless otherwise indicated:

1. Install unions, in piping NPS 2 and smaller, adjacent to each valve and at final connection to each piece of equipment.

2. Install flanges, in piping NPS 2-1/2 and larger, adjacent to flanged valves and at final connection to each piece of equipment.

3. Wet Piping Systems: Install dielectric coupling and nipple fittings to connect piping materials of dissimilar metals.

4. Underground, Exterior-Wall Penetrations: Install dielectric couplings and isolating flange gaskets for all underground piping connection the above piping. Coordinate locations and installation with corrosion control systems.

5. Coordinate locations and installation with corrosion control systems.

3.02 CONCRETE BASES

A. Anchor equipment to concrete base according to equipment manufacturer’s written instructions, according to Authority having Jurisdiction Seismic Codes, and Division 03 Anchorage to Concrete Specification

1. Construct concrete bases of dimensions indicated, but not less than 4 inches larger in both directions than supported unit with chamfer edges.

2. Install dowel rods to connect concrete base to concrete floor as shown on structural drawings.

3. Install Type 304 stainless steel anchors for supporting equipment that extends through concrete base, and anchors into structural concrete floor. Provide dieelectric insulation between dissimilar metals.

4. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.

5. Install anchor bolts to elevations required for proper attachment to supported equipment.

6. Install anchor bolts according to anchor-bolt manufacturer's written instructions.

7. Use minimum 4,000-psi, 28-day compressive-strength concrete.

END OF SECTION

SECTION 22 05 17

SLEEVES AND SLEEVE SEALS FOR PLUMBING

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for the following:

a. Sleeves.

b. Stack-sleeve fittings.

c. Sleeve-seal systems.

d. Sleeve-seal fittings.

e. Grout.

1.02 REFERENCES

A. This Section incorportates by reference the latest revisions of the following documents:

1. ASTM International ASTM):

a. ASTM A53.

b. ASTM E84/E814.

c. ASTM A377.

d. ASTM A-653.

e. ASTM A-888.

f. ASTM C1107.

g. ASME B36.10.

2. Underwriters Lab (UL):

a. UL (FRD) – Fire Resistance Directory.

1.03 SUBMITTALS

A. Submit:

1. Product Data: For each type of product indicated (Submittals shall be reviewed by Plumbing ans Structural EOR for applicability.)

PART 2 - PRODUCTS

2.01 COMPONENTS

A. Sleeves:

1. Cast-Iron Wall Pipe Sleeves: ASTM A377, Cast or fabricated of cast or ductile iron and equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop unless otherwise indicated.

2. Cast Iron Pipe sleeves: ASTM A-888 Cast Iron pipe with plain ends.

3. Galvanized-Steel Wall Pipes: ASTM A 53/A 53M, Schedule 40, with plain ends and welded steel collar; zinc coatedor equal corrosion inhibitor coating.

4. Galvanized-Steel-Pipe Sleeves: ASTM A53/A 53M, Type E, Grade B, Schedule 40, zinc coated, with plain ends.

5. Galvanized-Steel-Sheet Sleeves: ASTM A653, 0.0239-inch minimum thickness; round tube closed with welded longitudinal joint.

B. Stack-Sleeve Fittings:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. Jay R. Smith Mfg. Co.

b. Wade.

c. Zurn.

2. Description: Manufactured, cast-iron sleeve with integral clamping flange. Include clamping ring, bolts, and nuts for membrane flashing:

a. Underdeck Clamp: Clamping ring with setscrews.

C. Sleeve-Seal Systems:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. Advance Products & Systems, Inc.

b. CALPICO, Inc.

c. Metraflex Company (The).

d. Link-Seal.

e. Pipeline Seal and Insulator, Inc.

f. Proco Products, Inc.

2. Description: Modular sealing-element unit, designed for field assembly, for filling annular space between piping and sleeve.

a. An assembly consisting of a stainless steel frame, a compression mechanism, and insert modules for pipe, duct and tubing.

b. Comply with F- and T-ratings as required by local codes, code official, and as tested in accordance with ASTM E814 or UL1479.

c. Sealing Elements: EPDM-rubber interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.

d. Designs should be water and gas tight to 14.5 psi.

e. Seals shall be asbestos free, lead free, halogen free.

f. Pressure Plates: Stainless steel.

g. Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements.

D. Sleeve-Seal Fittings:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. Hold Rite.

b. Metraflex Company (The).

c. Pipeline Seal and Insulator, Inc.

2. Description: Manufactured plastic, sleeve-type, waterstop assembly made for imbedding in concrete slab or wall. Unit has plastic or rubber waterstop collar with center opening to match piping OD.

E. Grout:

1. Standard: ASTM C 1107/C 1107M, Grade B, post-hardening and volume-adjusting, dry, hydraulic-cement grout.

2. Characteristics: Nonshrink; recommended for interior and exterior applications.

3. Design Mix: 5000-psi, 28-day compressive strength.

4. Packaging: Premixed and factory packaged.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Sleeve Installation:

1. Install sleeves for piping passing through penetrations in floors, partitions, roofs, and walls. Provide waterproof flashing through exterior above grade roof.

2. For sleeves that will have sleeve-seal system installed, select sleeves of size large enough to provide 1-inch annular clear space between piping and concrete slabs and walls. Sleeves shall be two inches larger than proposed pipe diameter.

a. Sleeves are not required for core-drilled holes.

3. Install sleeves in concrete floors, concrete roof slabs, and concrete walls as new slabs and walls are constructed:

    a. Permanent sleeves are not required for holes in slabs formed by molded-PE or -PP sleeves.

    b. Cut sleeves to length for mounting flush with both surfaces:

        1) Exception: Extend sleeves installed in floors of mechanical equipment areas or other wet areas 2 inches above finished floor level.

    c. Using grout, seal the space outside of sleeves in slabs and walls without sleeve-seal system.

4. Install sleeves for pipes passing through interior partitions:

    a. Cut sleeves to length for mounting flush with both surfaces.

    b. Install sleeves that are large enough to provide 1/4-inch annular clear space between sleeve and pipe or pipe insulation.

    c. Seal annular space between sleeve and piping or piping insulation; use joint sealants appropriate for size, depth, and location of joint. Comply with applicable codes and standards requirements for joint sealants.

5. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials. Comply with applicable codes and standards requirements for firestopping.

B. Stack-Sleeve-Fitting Installation:

1. Install stack-sleeve fittings in new slabs as slabs are constructed:

    a. Install fittings that are large enough to provide 1/4-inch annular clear space between sleeve and pipe or pipe insulation.

    b. Secure flashing between clamping flanges for pipes penetrating floors with membrane waterproofing. Comply with applicable codes and standard for flashing.

    c. Install section of soil pipe to extend sleeve to 2 inches above finished floor level.

    d. Extend sleeve fittings below floor slab as required to secure clamping ring if ring is specified.

    e. Using grout, seal the space around outside of stack-sleeve fittings.

2. Fire-Barrier Penetrations: Maintain indicated fire rating of floors at pipe penetrations. Seal pipe penetrations with firestop materials. Comply with applicable codes and standards requirements for firestopping.

C. Sleeve-Seal-System Installation:

1. Install sleeve-seal systems in sleeves in exterior concrete walls above and below grade and slabs-on-grade at service piping entries into building.

2. Select type, size, and number of sealing elements required for piping material and size and for sleeve ID or hole size. Position piping in center of sleeve. Center piping

in penetration, assemble sleeve-seal system components, and install in annular space between piping and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make a watertight seal.

3. Fire-Barrier Penetrations: Maintain indicated fire rating of wall, floor at pipe penetrations. Seal pipe penetrations with firestop materials. Comply with applicable codes and standards requirements for firestopping.

D. Sleeve-Seal-Fitting Installation:

1. Install sleeve-seal fittings in new walls and slabs as they are constructed.

2. Assemble fitting components of length to be flush with both surfaces of concrete slabs and walls. Position waterstop flange to be centered in concrete slab or wall.

3. Secure nailing flanges to concrete forms.

4. Using grout, seal the space around outside of sleeve-seal fittings.

5. Fire-Barrier Penetrations: Maintain indicated fire rating of floors at pipe penetrations. Seal pipe penetrations with firestop materials. Comply with applicable codes and standards requirements for firestopping.

E. Sleeve And Sleeve-Seal Schedule:

1. Use sleeves and sleeve seals for the following piping-penetration applications:

a. Concrete structural elements (Not covered elsewhere in sleeve and sleeve-seal schedule):

1) Piping Smaller Than NPS 6: Cast-iron pipe sleeves.

2) Piping NPS 6 and Larger: Cast-iron pipe sleeves.

b. Exterior Concrete Walls above Grade:

1) Piping Smaller Than NPS 6: Cast-iron wall pipe sleeves with sleeve-seal system.

a) Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve-seal system.

2) Piping NPS 6 and Larger: Cast-iron wall pipe sleeves with sleeve-seal system.

a) Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve-seal system.

c. Exterior Concrete Walls below Grade:

1) Piping Smaller Than NPS 6: Cast-iron wall pipe sleeves with sleeve-seal system:

a) Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve-seal system.

2) Piping NPS 6 and Larger: Cast-iron wall pipe sleeves with sleeve-seal system:

a) Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve-seal system.

d. Concrete Slabs-on-Grade:

1) Piping Smaller Than NPS 6: Cast-iron wall pipe sleeves with sleeve-seal system:

a) Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve-seal system.

2) Piping NPS 6 and Larger: Cast-iron wall pipe sleeves with sleeve-seal system:

a) Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve-seal system.

e. Concrete Slabs above Grade:

1) Piping Smaller Than NPS 6: Galvanized-steel-pipe sleeves Stack-sleeve fittings.

2) Piping NPS 6 and Larger: Galvanized-steel-pipe sleeves Stack-sleeve fittings.

f. Interior Partitions:

1) Piping Smaller Than NPS 6: Galvanized-steel-pipe sleeves.

2) Piping NPS 6 and Larger: Galvanized-steel-sheet sleeves.

END OF SECTION

SECTION 22 05 50

IDENTIFICATION FOR PLUMBING PIPING AND EQUIPMENT

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Requirements for the following:

a. Equipment labels.

b. Valve tags.

c. Warning signs and labels.

d. Pipe labels.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. ANSI/ASME International:

a. ANSI/ASME A13.1 Scheme for Identification of Piping Systems.

1.03 SUBMITTALS

A. Submit:

1. Product Data: For each type of product indicated.

2. Schedules: Submit valve schedule for each piping system, typewritten and reproduced on 8-1/2 by 11-inch bond paper for mounting. Tabulate valve number, piping system, system abbreviations as shown on tag, location of valve, and variations for identification. Mark valves that are intended for emergency shut-off and similar special uses with “flags” in the margin of schedule. In addition to mounted copies, furnish copies as required for maintenance manuals.

3. Equipment Label Schedule: For each item of equipment to be labeled, on 8-1/2 by 11-inch bond paper. Tabulate equipment identification number and identify Contract Drawing numbers where equipment is indicated (plans, details, and schedules), plus the Contract Specifications Section number and title where equipment is specified. Equipment schedule shall be included in operation and maintenance data.

4. Samples: Submit samples of each color, lettering style, and other graphic representation required for each identification material or system.

1.04 QUALITY ASSURANCE

A. Material and Work:

1. Materials and equipment required for the work shall be new and shall be furnished, delivered, erected, installed, connected, and finished in every detail; and shall be selected and arranged to fit properly into the building spaces. Where no specific kind or quality of material is given, an article as approved by the Resident Engineer shall be provided.

2. Equipment and materials shall be installed with the approval of the Resident Engineer in accordance with the recommendations of the manufacturer.

B. Coordination:

1. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied.

2. Coordinate installation of identifying devices with locations of access panels and doors.

3. Install identifying devices before installing acoustical ceilings and similar concealment.

PART 2 - PRODUCTS

2.01 COMPONENTS

A. Equipment Labels:

1. Description:

a. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 inches by 3/4 inch.

b. Minimum Letter Size: 1/2 inch for name of units for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. If needed, include secondary lettering two-thirds to three-fourths the size of principal lettering.

c. Label Content: Include equipment’s Contract Drawing designation or unique equipment number.

2. Materials:

a. Material and Thickness: Multilayer, multicolor, rigid plastic polymer labels for mechanical engraving, 1/8 inch thick, or Stainless steel, 0.025 inch thick, and having predrilled holes for attachment hardware if the label shall be mounted with fasteners.

3. Label Letter and Background Color:

a. Letter Color.

4. Plastic: White.

5. Metal: Black.

6. Background Color:

a. Plastic: Black.

b. Metal: Natural.

7. Label Attachment Options:

   a. Fasteners: Stainless-steel rivets or stainless-steel self-tapping screws.

   b. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.

8. Valve Tags:

   A. Description:

      1) Valve Tags: 1-1/2 inches round, stamped or engraved with 1/4-inch letters for piping system abbreviation and 1/2-inch numbers.

9. Materials:

   a. Tag Material: Brass or Stainless steel, 0.032-inch minimum thickness, and having predrilled or stamped holes for attachment hardware.

   b. Valve Tag Letter and Background Color:

      1) Letter Color: Black.

      2) Background Color: Natural.

10. Attachment Method:

   a. Fasteners: Brass wire-link or beaded chain.

B. Warning Signs and Labels for Back of House

1. Description:

   a. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 inches by 3/4 inch.

   b. Minimum Letter Size:1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. If needed, include secondary lettering two-thirds to three-fourths the size of principal lettering.

   c. Label Content: Include caution and warning information, plus emergency notification instructions.

2. Material:

   a. Multilayer, multicolor, plastic labels for mechanical engraving, 1/8 inch thick, and having predrilled holes for attachment hardware:

      1) Letter Color: White.

      2) Background Color: Red.

3. Performance:

   a. Maximum Temperature: Able to withstand temperatures up to 160 degrees F.

4. Sign and Label Attachment Options:

   a. Fasteners: Stainless-steel rivets or self-tapping screws.

b. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.

C. Pipe Labels:

1. Description:

a. Preprinted, color-coded, with lettering indicating service, and showing flow direction.

2. Materials:

a. Pretensioned Pipe Labels: Precoiled, semirigid plastic formed to cover full circumference of pipe and to attach to pipe without fasteners or adhesive. 8 inches and larger pipe, labels shall be adhered with oversized nylon straps.

b. Self-Adhesive Pipe Labels: Printed plastic with contact-type, permanent-adhesive backing.

3. Pipe Label Contents: Include identification of piping system service using same designations or abbreviations as used on contract drawings, and an arrow indication flow direction.

a. Flow-Direction Arrows: integral with piping system service lettering to accommodate both directions or as separate unit on each pipe label to indicate flow direction.

b. Lettering Size: Minimum text height per ANSI/ASME A13.1.

1) Letter Color: Follow ANSI/ASME A13.1 color scheme.

2) Pipe Color: Follow ANSI/ASME A13.1 color scheme.

4. Pipe Label Color Schedule:

a. Domestic Water Piping:

1) Background Color: Green.

2) Letter Color: White.

3) Note type, e.g. “hot water”, “cold water”, “hot water recirc”, etc.

b. Sanitary Waste and Vent Piping:

1) Background Color: Brown.

2) Letter Color: White.

c. Storm Drainage and Rain Leader Piping:

1) Background Color: Black.

2) Letter Color: White.

d. Condensate Piping:

1) Background Color: Grey.

2) Letter Color: White.

PART 3 - EXECUTION

3.01 PREPARATION

A. Clean piping and equipment surfaces of substances that could impair bond of identification devices, including dirt, oil, grease, release agents, and incompatible primers, paints, and encapsulants.

B. Coordinate installation with piping insulation and heat trace installation as required.

3.02 INSTALLATION

A. Equipment Label Installation:

1. Install or permanently fasten labels on each major item of mechanical equipment.

2. Locate equipment labels where accessible and visible.

B. Valve Tag Installation:

1. Install tags on valves and control devices in piping systems, except check valves; valves within factory-fabricated equipment units; shutoff valves; faucets; convenience and lawn- watering hose connections; and similar roughing-in connections of end-use fixtures and units. List tagged valves in a valve schedule.

C. Pipe Label Installation

1. Locate pipe label where piping is exposed or above accessible ceilings in finished spaces; machine rooms; accessible maintenance spaces such as shafts, tunnels, and plenums; and exterior exposed locations as follows:

a. Near each valve and control device.

b. Near each branch connection, excluding short takeoffs for fixtures and terminal units. Where flow pattern is not obvious, mark each pipe at branch.

c. Near penetrations through walls, floors, ceilings, and inaccessible enclosures.

d. At access doors, manholes, and similar access points that permit view of concealed piping.

e. Near major equipment items and other points of origination and termination.

f. Spaced at maximum intervals of 50 feet along each run. Reduce intervals to 25 feet in areas of congested piping and equipment.

g. On piping above removable acoustical ceilings. Omit intermediately spaced labels.

END OF SECTION

SECTION 22 08 00

COMMISSIONING OF PLUMBING

NOTE TO DESIGNER:

SECTIONS WITH BRACKETS. E.G. (TEXT) ARE TO BE MODIFIED OR DELETED IF NOT APPLICABLE. ITALICIZED TEXT PROVIDES INSTRUCTION TO THE DESIGNER TO INCLUDE LANGUAGE ON SPECIFIC TOPIC WHEN APPLICABLE. THE INSTRUCTIONS ARE TO BE DELETED WHEN THE SPECIFICATION IS FINALIZED. LANGUAGE NOT IN BRACKETS IS TO BE USED AS IS WITHOUT MODIFICATION OR WITH AN APPROVED SPECIFICATION MODIFICATION REQUEST.

DESIGNER TO DELETE TEXT ABOVE FOR FINAL SECTION

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for Commissioning process for Plumbing, including:

a. Level 1 commissioning activities for plumbing.

b. Level 2 commissioning activities for plumbing.

c. Support for Level 3 commissioning activities related to plumbing.

d. Support for Level 4 commissioning activities related to plumbing.

B. Refer to the general commissioning requirements as stated elsewhere in the Contract Documents for general commissioning process requirements, including definitions, submittals, scheduling, execution of commissioning activities, and reporting.

1.02 REFERENCES

A. Definitions:

1. See general commissioning requirements as stated elsewhere in the Contract Documents for commissioning definitions.

2. Command: When used in the description of a commissioning activity, command means to use the station human machine interface (HMI) for the building management system (BMS) to control systems, equipment and components.

3. Human Machine Interface (HMI): Equipment, software, and functional programming at the locations shown on the Plans and according to field control system (FCS) as stated elsewhere in the Contract Documents.

4. Systems, Equipment, and Components: Where these terms are used together or separately, they shall mean "as-built" systems, equipment, and components.

1.03 COORDINATION

A. See general commissioning requirements as stated elsewhere in the Contract Documents for general coordination requirements related to commissioning.

1.04 COMMISSIONING ACTIVITIES

A. Furnish labor and material to accomplish building commissioning as referred in the general commissioning requirements as stated elsewhere in the Contract Documents, and herein, including:

1. Provide to the Sound Transit Testing and Commissioning Manager preliminary O&M information for use in developing commissioning test procedures.

2. Assist the Sound Transit Testing and Commissioning Manager in developing commissioning activity procedures and data forms submittals for work specified in this Section.

3. Provide information to the Testing and Commissioning Manager needed for control interface wiring diagrams submittals for the work of this Section.

4. Perform Level 1 and Level 2 commissioning activities specified in this Section, including installation verification, static tests, start-up, component tests, equipment tests, systems tests, and intrastation system interface tests.

5. Provide support for Level 3 commissioning activities, including jointly with the communications system contractor field testing points in the interface terminal strips, being present during level 3 testing with adequate labor and support personnel to adjust equipment and troubleshoot system failures that might arise. When material or equipment provided by this Division is found to be in conflict with specified criteria, adjust or replace said material or equipment, with the assistance of manufacturer as needed.

6. Operate equipment and system during commissioning activities as required by the Testing and Commissioning Manager .

7. Perform and document commissioning tests to verify readiness for commissioning test demonstration. Commissioning tests are specified herein.

8. Correct issues and repeat commissioning tests when results do not meet acceptance criteria.

9. Commissioning Test Demonstrations: Comply with general commissioning requirements, Level 1 and Level 2 commissioning activity commissioning test demonstrations as stated elsewhere in the Contract Documents:

   a. Repeat commissioning tests on a sample basis to demonstrate acceptable performance: Level 1 Component, Equipment, and System Commissioning Tests, and for Level 2 Intra-station system interface tests.

   b. Record and submit commissioning test demonstration data and issues.

   c. Correct issues and repeat commissioning test demonstration when results do not meet Acceptance Criteria.

10. Attend commissioning meetings as requested by the Sound Transit Testing and Commissioning Manager .

11. Report any inconsistencies or issues in system operations or performance.

12. Provide personnel to support commissioning test demonstration specified herein as requested by the Sound Transit Commissioning Coordinator.

13. In the event that a commissioning test demonstration fails, assist in determining the cause of failure. Make corrections as necessary.

B. Cooperate with Sound Transit Testing and Commissioning Manager to make equipment and systems ready for commissioning tests specified herein as early in the construction schedule as possible.

1.05 QUALITY ASSURANCE

A. Coordinate completion of Install Verification forms, by the Quality Control Inspector, as identified in the Contractors Quality Control Inspection and Test Plan.

PART 2 - PRODUCTS

2.01 TEST EQUIPMENT

A. Provide test equipment and instrumentation, including consumable supplies, required to execute commissioning activities. Unless noted otherwise, test equipment and instrumentation remain the property of the Contractor.

B. Provide proprietary test instruments or tools required by the equipment manufacturer. Provide and operate the proprietary test instruments or tools as required for commissioning work.

PART 3 - EXECUTION

3.01 LEVEL 1 COMMISSIONING ACTIVITIES REQUIREMENTS

A. Level 1 commissioning activities scope: Technical requirements for commissioning of plumbing are specified herein.

B. Provide technicians, instrumentation, and tools to perform commissioning activities in accordance with accepted commissioning activity procedures at the direction of the Sound Transit Testing and Commissioning Manager.

C. Scope of plumbing commissioning activities applies to all portions of the plumbing installation described in the test. Where sampling is specified, it applies only to the commissioning test demonstration.

D. Upon approval of product submittals associated with the Technical requirements and the scope of Commissioning develop and submit for approval Install Verification Checklist forms for the quality criteria of the Work specified herein.

E. Preparation:

1. Certify that plumbing systems, equipment, and materials have been completed, calibrated, and started; and are operating in accordance with Contract Documents.

2. Testing Instrumentation: Install measuring instruments and logging devices to record test data in accordance with accepted commissioning test procedures as directed by the Testing and Commissioning Manager.

3. Certify that plumbing instrumentation and control systems have been completed and calibrated; are operating according to the Contract Documents; and that pretest set points have been recorded.

F. Test all operating modes, interlocks, control responses, and responses to abnormal or emergency conditions, and verify proper response of building automation system controllers and sensors.

G. Perform tests using design conditions whenever possible. If tests cannot be completed because of a deficiency outside the scope of the Equipment system, document the deficiency and report it to Sound Transit. After deficiencies are resolved, reschedule tests.

H. Simulated conditions may need to be imposed using an artificial load when it is not practical to test under design conditions. Provide equipment to simulate loads. Set simulated conditions in accordance with accepted commissioning test procedures as directed by the Testing and Commissioning Manager. Document simulated conditions and methods of simulation. After tests, return settings to normal operating conditions.

I. Request approval to alter set points when simulating conditions is not practical. Request approval to alter sensor values with a signal generator when design or simulating conditions and altering set points are not practical.

J. If tests cannot be completed because of a deficiency outside the scope of the plumbing system, document the deficiency and report it to Sound Transit. After deficiencies are resolved, reschedule tests.

K. Where seasonal testing is specified, complete appropriate initial commissioning tests and documentation within the Construction Period. Schedule and execute seasonal tests when specified conditions are expected.

3.02 LEVEL 1 AND LEVEL 2 COMMISSIONING ACTIVITY PROCEDURES

A. Submit Level 1 commissioning activity test procedures and data forms for the following types of commissioning activities, requirements for which are specified herein:

1. Level 1 commissioning activities:

a. Installation verification.

b. Static tests.

c. Start-up procedures.

d. Component tests.

e. Equipment tests.

f. System tests.

2. Level 2 commissioning activities:

a. Intra-station system interface tests.

3.03 LEVEL 1 INSTALLATION VERIFICATION CHECKLIST REQUIREMENTS

A. Installation verification checklist forms shall include the following:

1. Organized to prompt the installer to check off quality criteria for each discrete portion of the Work.

2. Identify the system or features to which the installation verification checklist applies at the top of the form.

3. Section for verification of delivery of accepted materials.

4. Section for condition of materials at delivery.

5. Section for verification that installation meets contract documentation and any special installation instructions by respective manufacture.

6. Space at the end of the form for the installer to print their name, fill in the date, and sign or initial.

7. Space at the end of the form for the Quality Control inspector designated for the scope to review and accept installation verification. QC Inspector must perform Install Verification and verify each element identified in form has been reviewed for conformance with contract documents and in accordance with the Contractors Quality Control Inspection and Test Plan as part of Section 01 45 00 – Quality Assurance / Quality Control.

8. Space to identify the area of work for which the installer is executing the Installation Verification Checklist.

9. Description of the quality criteria as it pertains to the specific work. Include a check-box for each criterion.

10. Example checklists/test forms can be provided upon request.

B. Quality Criteria: Installation verification checklists shall address the following quality criteria:

1. Make and model match accepted submittals, including for motors, full load amperage rating and winding insulation class.

2. Equipment is installed without visible damage.

3. Location is as indicated on drawings.

4. Equipment is accessible for maintenance using safe work practices.

5. There is sufficient space to remove and replace components intact without demolishing other work.

6. Equipment surfaces are clean and free of dust, dirt, oil and other contaminants.

7. Equipment is accessible for adjustment, maintenance, and testing, including replacement of components or the entire assembly.

8. Piping is properly supported and seismically braced.

9. Equipment is installed level, or pitched per manufacturer's requirements.

10. Waste and vent piping is installed with required pitch without reverse pitch.

11. Vibration isolation devices are adjusted to required static deflection and support the equipment level.

12. Before performing a commissioning test, installation verification checklists must be performed and completed by QC inspector designated for the appropriate area specified here in and within the Contractors Quality Control Inspection and Test

Plan as part of Section 01 45 00 – Quality Assurance / Quality Control. Submit completed installation verification checklists for work included in the commissioning test. Erection / Installation / Application

C. Fill out and sign installation verification checklists for plumbing while the Work is being installed. The intent is to fill out and sign the installation verification checklist as work proceeds to improve the quality of the installation. Retain completed installation verification checklists on site for review.

3.04 LEVEL 1 INSTALLATION VERIFICATION

A. Installation Verification checklists are required to include the following, at a minimum:

1. 2208-IV-01 Meters and Gages for Plumbing Piping:
    a. Metal-case, liquid-in-glass thermometers.
    b. Bimetallic-actuated dial thermometers.
    c. Pressure gages.
2. 2208-IV-02 General-duty valves for plumbing piping.
3. 2208-IV-03 Domestic Water Piping:
    a. Domestic water piping.
4. 2208-IV-04 Domestic Water Piping Specialties:
    a. Reduced pressure backflow preventers.
    b. Double check valves.
    c. Water pressure reducing valves – water regulators.
    d. Trap-seal primer valves.
    e. Balancing Valves.
    f. Vibration and seismic controls for plumbing piping and equipment.
5. 2208-IV-05 Sanitary Waste and Vent Piping:
    a. Sanitary and vent piping.
    b. Oil/water separator.
    c. Vibration and seismic controls for plumbing piping and equipment.
6. 2208-IV-06 Pumping Station Piping and Appurtenances:
    a. Drainage pumping station piping and appurtenances.
7. 2208-IV-07 Facility Storm Drainage and Drainage System for Structure Piping:
    a. Storm drainage piping.
    b. Vibration and seismic controls for plumbing piping and equipment.
8. 2208-IV-08 Sump Pumps:
    a. Pumps and pump controls for the wastewater pump station.

9. 2208-IV-09 Electric Domestic Water Heaters:

   a. Electric domestic water heater and controls.

10. 2208-IV-10 Heat Tracing for Plumbing, including:

    a. Heating cable installation, securement, termination.

    b. Heater trace circuit controller.

    c. Remote temperature sensor.

11. 2208-IV-10 Plumbing Fixtures:

    a. Lavatories.

    b. Mop Sinks.

    c. Service sinks.

    d. Urinals.

    e. Water closets.

    f. Drinking Fountains.

    g. Hose Bibbs.

3.05 LEVEL 1 STATIC TESTS

A. Static Test checklists are required to include the following, at a minimum:

1. 2208-ST-01: Water Piping Leak Test:

   a. System/Equipment to be Tested:

      1) Domestic water piping: Refer to the domestic water piping as stated elsewhere in the Contract Documents.

   b. Functions to be Tested:

      1) See "Test domestic water piping" as stated elsewhere in the Contract Documents.

   c. Conditions of the Test:

      1) See "Test domestic water piping" as stated elsewhere in the Contract Documents.

   d. Acceptable Results:

      1) See "Test domestic water piping" as stated elsewhere in the Contract Documents.

2. 2208-ST-02: Sanitary Waste and Vent Pipe Leak Test:

   a. System/Equipment to be Tested:

      1) For waste and vent piping refer to the sanitary waste and vent piping as stated elsewhere in the Contract Documents, including Sanitary Waste Sump and associated access door.

   b. Functions to be Tested:

      1) Leakage under gravity pressure.

c. Conditions of the Test:

1) Test shall be successfully completed before covering piping.

2) Plug openings and fill system with water such that all pipe joints and fittings are subjected to 10 feet of water head pressure. Exception: piping that penetrates the roof shall be filled to fullest height.

3) One hour after the system or section has been filled; visually inspect the piping for evidence of leakage.

4) Include in Static Test Procedures and Data Forms submittal:

a) Leakage testing plan showing how piping will be divided if testing will be performed in sections.

d. Acceptable Results:

1) No visible evidence of leakage.

3. 2208-ST-03: Storm Drainage Pipe Leak Test

a. System/Equipment to be Tested:

1) Storm drainage piping: Comply with facility storm drainage piping as stated elsewhere in the Contract Documents.

b. Functions to be Tested:

1) Leakage under gravity pressure.

c. Conditions of the Test:

1) Test shall be successfully completed before covering piping.

2) Plug openings and fill system with water such that all pipe joints and fittings are subjected to 10 feet of water head pressure. Exception: piping that penetrates the roof shall be filled to fullest height.

3) One hour after the system of section has been filled: visually inspect the piping for evidence of leakage.

4) Include in Static Test Procedures and Data Forms submittal:

a) Leakage testing plan showing how piping will be divided if testing will be performed in sections.

d. Acceptable Results:

1) No visible evidence of leakage.

3.06 LEVEL 1 START-UP

A. Start-up checklists are required to include the following, at a minimum:

1. 2208-SU-01: Domestic Water Heater Start-up:

a. System/Equipment to be Tested:

1) Domestic water heater and associated controls.

b. Functions to be Tested:

1) For installation of water heater refer to the electric domestic water heaters as stated elsewhere in the Contract Documents.

2) Installation and start-up per manufacturer's recommendations.

c. Conditions of the Test:

1) Perform start-up according to manufacturer's procedures. Start-up by manufacturer-authorized personnel. Use manufacturer's data forms to record start-up results.

d. Acceptable Results:

1) Installation and start-up meet the manufacturer's requirements.

2. 2208-SU-02: Submersible Sewage Pumps:

a. System/Equipment to be Tested:

1) Submersible Sewage Pumps and associated pump controls.

b. Functions to be Tested:

1) For installation refer to the sump pumps as stated elsewhere in the Contract Documents.

2) Installation and start-up per manufacturer's recommendations.

c. Conditions of the Test:

1) Perform start-up according to manufacturer's procedures. Start-up by manufacturer-authorized personnel. Use manufacturer's data forms to record start-up results.

d. Acceptable Results:

1) Installation and start-up meet the manufacturer's requirements.

3. 2208-SU-03: Trap Seal Primers:

a. System/Equipment to be Tested:

1) All Trap Seal Primers and associated controls.

b. Functions to be Tested:

1) Installation per trap seal primers as stated elsewhere in the Contract Documents.

2) Installation and start-up per manufacturer's recommendations.

c. Conditions of the Test:

1) Perform start-up according to manufacturer's procedures. Start-up by manufacturer-authorized personnel. Use manufacturer's data forms to record start-up results.

d. Acceptable Results:

1) Installation and start-up meet the manufacturer's requirements.

3.07 LEVEL 1 COMPONENT TESTS

A. Component Test checklists are required to include the following, at a minimum:

1. 2208-C-01: Water Pressure Gauge Calibration:

a. System/Equipment to be Tested:

1) For fluid pressure gauges in plumbing systems refer to the meters and gages for plumbing piping requirements as stated elsewhere in the Contract Documents.

b. Functions to be Tested:

1) Accuracy of fluid pressure indication.

c. Conditions of the Test:

1) Systems in which pressure gauges are installed shall operate at their normal flow rates and pressures during the test.

a) Subject pressure gauge to pressure at or near the high pressure at which the system is scheduled to operate. Subject calibration instrument to the same pressure. Record pressures indicated by both instruments.

b) Subject pressure gauge to pressure at or near the low pressure at which the system is scheduled to operate. Subject calibration instrument to the same pressure. Record pressures indicated by both instruments.

c) With system pressure stable, install calibration instrument in place of the pressure gauge. Record calibration instrument pressure. Install the pressure gauge in the same location. Record pressure gauge pressure.

d. Acceptable Results:

1) Pressure gauge pressures recorded at each stage shall be within plus or minus 2.0 percent of calibration instrument pressures.

2. 2208-C-02: Trap Primers:

a. System/Equipment to be Tested:

1) For trap seal primer valve stations and controls refer to the domestic water piping specialties requirements as stated elsewhere in the Contract Documents.

b. Functions to be Tested:

1) Priming of floor drain traps.

2) Control timer operation.

c. Conditions of the Test:

1) Operate each trap primer station by activating the override. Observe and record results at each primed drain.

2) Observe operation of each trap primer station timer.

d. Acceptable Results:

1) Each primed floor drain trap receives water from the trap primer when the override is actuated.

2) Trap primer valve opens for 10 seconds once in 24 hours.

3. 2208-C-03: Backflow Preventers:

a. System/Equipment to be Tested:

1) For reduced-pressure-principle backflow preventers in plumbing systems refer to the domestic water piping specialties requirements as stated elsewhere in the Contract Documents.

2) For double-check backflow prevention assemblies in plumbing systems refer to the domestic water piping specialties requirements as stated elsewhere in the Contract Documents.

b. Functions to be Tested:

1) Backflow assembly functions mandated by the authority having jurisdiction (AHJ).

c. Conditions of the Test:

1) Perform field test of backflow preventers in accordance with requirements of the local AHJ.

d. Acceptable Results:

1) Backflow preventer functions as required by AHJ.

4. 2208-C-04: Actuated Drain Valves:

a. System/Equipment to be Tested:

1) For all pumping station actuated drain valves refer to the pumping station piping and appurtenances as stated elsewhere in the Contract Documents.

b. Functions to be Tested:

1) Opening and closing of valves.

c. Conditions of the Test:

1) Command valve closed. Fill force main with water.

2) Command valve open for 10 seconds.

3) Command valve closed.

d. Acceptable Results:

1) Valve closes and does not leak when force main is filled.

2) Valve opens and water drains freely.

3) Valve closes and does not leak.

5. 2208-C-05: Water Pressure-Reducing Valves:

   a. System/Equipment to be Tested:

      1) For water regulators in plumbing systems refer to the domestic water piping specialties requirements as stated elsewhere in the Contract Documents.

   b. Functions to be Tested:

      1) Control of outlet pressure under varying flows.

   c. Conditions of the Test: During the test, ensure that only test personnel operate water valves in the system.

      1) With all valves closed, observe water pressure downstream of regulators.

      2) Open one lavatory valve. Observe water pressure downstream of regulators for one minute.

      3) Open sufficient valves to increase flow to approximately 10 percent of design flow. Observe water pressure downstream of regulators for one minute.

      4) Open sufficient valves to increase flow to approximately 50 percent of design flow. Observe water pressure downstream of regulators for one minute.

      5) Continue opening valves to increase flow to approximately 100 percent of design flow. Observe water pressure downstream of regulators for one (1) minute.

   d. Acceptable Results:

      1) For all conditions, downstream pressure is stable within plus or minus 2 pounds per square inch of setpoint (60 pounds per square inch initially).

6. 2208-C-06: Oil Separators:

   a. System/Equipment to be Tested:

      1) Oil Separators in plumbing systems; refer to sanitary waste and vent piping requirements as stated elsewhere in the Contract Documents.

   b. Functions to be Tested:

      1) Ability to capture and prevent the migration of oil past the interceptor.

   c. Conditions of the Test: During the test, ensure that only test personnel operate the components of the interceptor.

      1) Verify that the interceptor is provided with all baffles and components required for correct operation.

      2) Verify that the interceptor is level to within the manufacturer's tolerances for proper operation.

      3) Introduce a small amount of oil into the inlet side of the interceptor while waste water is actively flowing through it.

d. Acceptable Results:

1) With water flowing through the unit, oil remains trapped in the containment chamber without passing through to the exit side of the unit.

3.08 LEVEL 1 EQUIPMENT TESTS

A. Equipment Test checklists are required to include the following, at a minimum:

1. 2208-E-01: Sump Pump Controller:

a. System/Equipment to be Tested:

1) For sanitary sewage pumps and associated pump controls for sanitary sewage pump stations refer to the sump pumps as stated elsewhere in the Contract Documents.

b. Functions to be Tested:

1) Pump controller digital point LED display.

2) Pump controller analog point display.

3) Pump controller operator interface display.

c. Conditions of the Test:

1) Switch the status of each digital point and observe the corresponding LED display.

2) Vary the input or output value of each analog point and observe the corresponding display.

3) Demonstrate dynamic display of process parameters, process equipment and all associated controlled and monitored process variables being monitored by the PLC processor.

4) Modify a randomly selected sample of ten process parameters being monitored by the PLC processor. Restore original values at the completion of the step.

d. Acceptable Results:

1) LED display is present and correctly reflects status of digital points.

2) Display is present and correctly reflects value of analog points.

3) Process parameters, process equipment and all associated controlled and monitored process variables display correct dynamic values.

4) Selected parameters are capable of being changed and saved to memory.

2. 2208-E-02: Sump Pump Operation:

a. System/Equipment to be Tested:

1) All sanitary sewage pumps and associated pump controls for sanitary sewage pump stations, refer to sump pumps requirements as stated elsewhere in the Contract Documents.

b. Functions to be Tested:

1) Sump pump control and alarm functions.

c. Conditions of the Test:

1) Determine water volume in sump between high level alarm signal level and low level cutoff level.

2) With all pumps disabled, verify rising water levels at which each pump is commanded to start, and the level at which the high level alarm signal is initiated at the pump control panel.

3) With one pump enabled, verify falling water levels at which the high level alarm signal is cancelled and the level at which each pump is commanded to stop.

4) Fill to normal “pump on” elevation with all pumps enabled.

5) Repeat and fill to normal “pump on” elevation with all pumps enabled.

6) Fill to high water level while both pumps are disabled and then re-enable the pumps to operate.

7) Turn the electrical disconnect off to one of the pumps.

8) Loss of building normal electrical power.

d. Acceptable Results:

1) Switch and alarm action occurs within plus or minus 1.0 inch of scheduled level.

2) Switch and alarm action occurs within plus or minus 1.0 inch of scheduled level.

3) The pump controller automatically changes the designation of the lead and lag pumps (automatic alternation of lead pump) and the newly-designated lead pump turns on and then automatically shuts off at the “pump off” elevation.

4) With water at high water level, and pumps re-enabled, both pumps start and then stop when the water level reaches the “pump off” elevation.

5) The pump that still has electrical service to its controller operates continues to operate correctly when the other pump has lost electrical service.

6) The sump pumps continue to operate under emergency power with no operator intervention or nuisance alarms when pumps switch between normal to emergency power and then back again from emergency to normal power.

3. 2208-E-03: Sump Pump Removal and Reinstallation:

a. System/Equipment to be Tested:

1) For sanitary sewage pumps and associated pump controls for sanitary sewage pump stations refer to the sump pumps as stated elsewhere in the Contract Documents.

b. Functions to be Tested:

1) Ability to remove sump pump from sump without entering sump.

2) Ability to reinstall sump pump in sump without entering sump.

c. Conditions of the Test: Prerequisite:

1) Following manufacturer's instructions, remove sump pump from sump without entering sump.

2) Following manufacturer's instructions, reinstall sump pump in sump without entering sump.

3) Restore automatic control equipment and functions to normal operating condition. Fill the sump with water until the pump starts automatically. Measure the pump-down time.

d. Acceptable Results:

1) Pump removal, using manufacturer's recommended tools and methods, proceeds without incident.

2) Pump reinstallation, using manufacturer's recommended tools and methods, proceeds without incident.

3) Pump starts and stops automatically. Pump runs normally. Pump-down time is the same as noted during Level 1 test 2208-E-02, Sump Pump Operation

4. 2208-E-04: Heat Tracing Control for Plumbing:

a. System/equipment to be tested:

1) Self-Regulating, Parallel-Resistance Heating Cables.

2) Heater Trace Circuit Controller.

b. Functions to be tested:

1) Response to ambient temperature below freeze protection setpoint.

2) Heating cable fault alarm.

c. Conditions of the test:

1) Subject temperature sensor to temperature approximately 3 degrees Fahrenheit above freeze protection setpoint (initial setpoint 41 degrees Fahrenheit). Monitor sensed temperature with a calibration-grade thermometer. Gradually change setpoint or sensed temperature until freeze protection circuit is energized.

2) Simulate an electrical fault on the heating cable.

d. Acceptance Criteria:

1) Freeze protection circuit is energized at setpoint temperature minus 2 degrees Fahrenheit.

2) Heater trace circuit controller initiates an alarm of cable fault. Alarm is correctly reported at BMS panel.

5. 2208-E-05: Trap Seal Primers:

   a. System/Equipment to be Tested:

      1) All Trap Seal Primers and associated controls.

   b. Functions to be Tested:

      1) Installation per trap seal primers as stated elsewhere in the Contract Documents.

      2) Installation and start-up per manufacturer's recommendations.

   c. Conditions of the Test:

      1) Perform start-up according to manufacturer's procedures. Start-up by manufacturer-authorized personnel. Use manufacturer's data forms to record start-up results.

   d. Acceptable Results:

      1) Installation and start-up meet the manufacturer's requirements.

6. 2208-E-06: Domestic Water Heaters:

   a. System/Equipment to be Tested:

      1) Domestic water heater and associated controls.

   b. Functions to be Tested:

      1) For installation of water heater refer to the electric domestic water heaters as stated elsewhere in the Contract Documents.

      2) Installation and start-up per manufacturer's recommendations.

   c. Conditions of the Test:

      1) Perform start-up according to manufacturer's procedures. Start-up by manufacturer-authorized personnel. Use manufacturer's data forms to record start-up results.

   d. Acceptable Results:

      1) Installation and start-up meet the manufacturer's requirements.

3.09 LEVEL 1 SYSTEM TESTS

A. System Test checklists are required to include the following, at a minimum:

1. 2208-S-01: Sanitary Sewage Pumps: System:

   a. System/Equipment to be Tested:

      1) All Track Drainage Pumps and associated pump controls for the sanitary sewage pump station and sump pumps.

   b. Functions to be Tested:

      1) Sequence of operation.

c. Conditions of the Test: Start the test with all controls in normal, automatic control, and all pumps enabled. Pumps may be temporarily disabled while filling the sump to the required level.

1) Sump fluid level below the “Low Level Alarm” level. Lead pump: ”Off”.

2) Sump fluid level above the “Low Level Alarm” level and below the first pump “On” level.

3) Disconnect communication link with BMS. Sump fluid level above the first pump “On” level and below the second pump “On” level.

4) Sump fluid level above the second pump “On” level and below the “High Water Alarm” level.

5) Restore communication link with BMS. Sump fluid level above the “High Water Alarm” level.

6) Verify response to failure of a pump by failing each pump in turn while it is operating as the lead pump. Restore each pump to normal control after verifying response to failure and before failing the next pump.

d. Acceptable Results:

1) “Low Level Alarm” is activated and communicated to the BMS. All pumps are “Off.”

2) “Low Level Alarm” is cleared and communicated to the BMS. All pumps are “Off.”

3) Loss of communication with BMS does not impair local control. Lead pump is “On,” and “Stops” after water level falls below the “All Pumps Off” level. The lead pump is ”Off”.

4) Lead pump, and lag pump are “On,” and “Stop” after water level falls below the “All Pumps Off” level. The lead pump is ”Off”.

5) Restoration of communication link with BMS does not impair control. The “High Water Alarm” is activated and communicated to the BMS. Lead pump and lag pump are “On,” and “Stop” after water level falls below the “All Pumps Off” level. The “High Water Alarm” is cleared and communicated to the BMS after water level falls below “High Water Alarm” level. The lead pump is ”Off”.

6) When a pump fails, the next pump in the operating sequence shall start and a common alarm shall be annunciated at the Operations Control Center.

2. 2208-S-02: Sanitary Sewage Pump – System:

a. System/Equipment to be Tested:

1) For track drainage pumps, and associated pump controls for the sanitary sewage pump station, refer to the sump pumps as stated elsewhere in the Contract Documents.

b. Functions to be Tested:

1) Sequence of operation.

c. Conditions of the Test: Start the test with all controls in normal, automatic control, and pump enabled. Pump may be temporarily disabled while filling the sump to the required level.

1) Sump fluid level below the “Low Level Alarm” level.

2) Sump fluid level above the “Low Level Alarm” level and below pump “On” level.

3) Disconnect communication link with BMS. Sump fluid level above pump “On” level and below the “High Water Alarm” level.

4) Restore communication link with BMS. Sump fluid level above the “High Water Alarm” level.

5) Verify response to failure of pump by failing pump while it is operating. Restore pump to normal control after verifying response to failure.

d. Acceptable Results:

1) “Low Level Alarm” is activated and communicated to the BMS. Pump is “Off.”

2) “Low Level Alarm” is cleared and communicated to the BMS. Pump is “Off.”

3) Loss of communication with BMS does not impair local control. Pump is “On,” and “Stops” after water level falls below the “Pump Off” level.

4) Restoration of communication link with BMS does not impair control. The “High Water Alarm” is activated and communicated to the BMS. Pump is “On,” and “Stops” after water level falls below the “Pump Off” level. The “High Water Alarm” is cleared and communicated to the BMS after water level falls below “High Water Alarm” level.

5) When pump fails, a common alarm shall be annunciated at the Operations Control Center.

SECTION 22 13 16

SANITARY WASTE AND VENT PIPING

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for the following soil and waste, sanitary drainage, and vent piping inside the building:

a. Pipe, tube, and fittings.

b. Special pipe fittings.

1.02 REFERENCES

A. This section incorporates by reference the latest revisions of the following documents:

1. ASTM International (ASTM):

a. ASTM A53 Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.

b. ASTM A74 Standard Specification for Cast Iron Soil Pipe and Fittings.

c. ASTM A106 Standard Specification for Seamless Carbon Steel Pipe for High-Temperature Service.

d. ASTM A733 Standard Specification for Welded and Seamless Carbon Steel and Austenitic Stainless Steel Pipe Nipples.

e. ASTM A888 Standard Specification for Hubless Cast Iron Soil Pipe and Fittings for Sanitary and Storm Drain, Waste, and Vent Piping Applications.

f. ASTM B32 Standard Specification for Solder Metal.

g. ASTM B306 Standard Specification for Copper Drainage Tube (DWV).

h. ASTM B813 Standard Specification for Liquid and Paste Fluxes for Soldering of Copper and Copper Alloy Tube.

i. ASTM B828 Standard Practice for Making Capillary Joints by Soldering of Copper and Copper Alloy Tube and Fittings.

j. ASTM C564 Standard Specification for Rubber Gaskets for Cast Iron Soil Pipe and Fittings.

k. ASTM C1277 Standard Specification for Shielded Couplings Joining Hubless Cast Iron Soil Pipe and Fittings.

2. American Society of Sanitary Engineering (ASSE):

a. ASSE 1043 Performance Requirements for Cast Iron Sanitary Drainage Systems.

3. Manufacturers Standardization Society (MSS):

a. MSS SP-69 Pipe Hangers and Supports – Selection and Applications.

1.03 SUBMITTALS

A. Submit:

1. Shop Drawings.

2. Inspection Reports.

3. Field quality-control inspection and test reports.

1.04 QUALITY ASSURANCE

A. Piping materials shall bear label, stamp, or other markings of an independent testing laboratory.

PART 2 - PRODUCTS

2.01 PIPING MATERIALS

A. Hub-and-Spigot, Cast-Iron Pipe and Fittings: ASTM A74, Service class:

1. Gaskets: ASTM C564, rubber.

B. Hubless Cast-Iron Pipe and Fittings: ASTM A888 or CISPI 301:

1. Stack Fittings: ASME B16.45 or ASSE 1043, hubless, cast-iron aerator and deaerator drainage fittings.

2. Shielded Couplings: ASTM C1277 or CISPI 301 assembly of metal shield or housing, corrosion-resistant fasteners, and rubber sleeve with integral, center pipe stop:

a. Heavy-Duty, Shielded, Stainless-Steel Couplings: With stainless-steel shield, stainless-steel bands and tightening devices, and ASTM C564, rubber sleeve.

C. Steel Pipe: ASTM A53/A53M, Type E or S, Grade A or B, Schedule 40, galvanized. Include ends matching joining method:

1. Drainage Fittings: ASME B16.12, galvanized, threaded, cast-iron drainage pattern.

2. Pressure Fittings:

a. Steel Pipe Nipples: ASTM A733, made of ASTM A53/A53M or.

b. ASTM A106, Schedule 40, galvanized, seamless steel pipe; include ends matching joining method.

c. Malleable-Iron Unions: ASME B16.39; Class 150; hexagonal-stock body with ball-and-socket, metal-to-metal, bronze seating surface; and female threaded ends.

d. Gray-Iron, Threaded Fittings: ASME B16.4, Class 125, galvanized, standard pattern.

e. Cast-Iron Flanges: ASME B16.1, Class 125.

f. Cast-Iron, Flanged Fittings: ASME B16.1, Class 125, galvanized.

D. Copper DWV Tube: ASTM B306, drainage tube, drawn temper:

1. Copper Drainage Fittings: ASME B16.23, cast copper or ASME B16.29, wrought-copper, solder-joint fittings.

PART 3 - EXECUTION

3.01 APPLICATION

A. Special pipe fittings with pressure ratings at least equal to piping pressure ratings may be used in applications below, unless otherwise indicated.

B. Flanges and unions may be used on aboveground pressure piping, unless otherwise indicated.

C. Aboveground, soil, waste, and vent piping shall be any of the following: Hubless cast-iron soil pipe and fittings; heavy-duty shielded, stainless-steel couplings; and hubless- coupling joints:

1. Underground, soil, waste, and vent piping NPS 4 and smaller shall be any of the following:

a. Service class, hub-and-spigot, cast-iron soil pipe and fittings; gaskets; and compression joints.

b. Hubless cast-iron soil pipe and fittings; heavy-duty shielded, stainless-steel couplings; and hubless-coupling joints.

D. Underground, soil and waste piping NPS 5 and larger shall be any of the following:

1. Service class, cast-iron soil pipe and fittings; gaskets; and compression joints.

2. Hubless cast-iron soil pipe and fittings; heavy-duty shielded, stainless-steel couplings; and hubless-coupling joints.

3.02 INSTALLATION

A. Piping Installation:

1. Install cleanouts at grade and extend to where building sanitary drains connect to building sanitary sewers.

2. Install cast-iron sleeve with water stop and mechanical sleeve seal at each service pipe penetration through foundation wall. Select number of interlocking rubber links required to make installation watertight. Sleeves and mechanical sleeve seals, and wall sleeves shall apply. Install cast-iron soil piping according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook," Chapter IV, "Installation of Cast Iron Soil Pipe and Fittings."

3. Make changes in direction for soil and waste drainage and vent piping using appropriate branches, bends, and long-sweep bends. Sanitary tees and short-sweep 1/4 bends may be used on vertical stacks if change in direction of flow is from horizontal to vertical. Use long-turn, double Y-branch and 1/8-bend fittings if two fixtures are installed back to back or side by side with common drain pipe. Straight tees, elbows, and crosses may be used on vent lines. Do not change direction of flow more than 90 degrees. Use proper size of standard increasers and reducers if pipes of different sizes are connected. Reducing size of drainage piping in direction of flow is prohibited.

4. Lay buried building drainage piping beginning at low point of each system. Install true to grades and alignment indicated, with unbroken continuity of invert. Place hub ends of piping upstream. Install required gaskets according to manufacturer's written instructions for use of lubricants, cements, and other installation requirements. Maintain swab in piping and pull past each joint as completed.

5. Install soil and waste drainage and vent piping at the following minimum slopes, unless otherwise indicated:

    a. Building Sanitary Drain: 2 percent downward in direction of flow for piping NPS 4 and smaller; for pipe larger than NPS 4 1 percent downward in direction of flow for piping is allowed.

    b. Horizontal Sanitary Drainage Piping: 2 percent downward in direction of flow.

    c. Vent piping: 2 percent down toward vertical fixture vent or toward vent stack unless indicated otherwise.

6. Sleeves are not required for cast iron soil piping passing through concrete slabs-on-grade if slab is without membrane waterproofing.

7. Do not enclose, cover, or put piping into operation until it is inspected and approved by authorities having jurisdiction.

B. Joint Construction:

1. Cast-Iron, Soil-Piping Joints: Make joints according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook," Chapter IV, "Installation of Cast Iron Soil Pipe and Fittings."

2. Gasketed Joints: Make with rubber gasket matching class of pipe and fittings.

3. Hubless Joints: Make with rubber gasket and sleeve or clamp.

4. Soldered Joints: Use ASTM B813, water-flushable, lead-free flux; ASTM B32, lead-free- alloy solder; and ASTM B828 procedure, unless otherwise indicated.

C. Valve Installation:

1. Shutoff Valves: Install shutoff valve on each sewage pump discharge.

    a. Use gate or full-port ball valve for piping NPS 2 and smaller.

    b. Use gate valve for piping NPS 2-1/2 and larger.

2. Check Valves: Install swing check valve, downstream from shutoff valve, on each sewage pump discharge.

3. Backwater Valves: Install backwater valves in piping subject to sewage backflow:

a. Horizontal Piping: Horizontal backwater valves. Use normally closed type, unless otherwise indicated.

b. Floor Drains: Drain outlet backwater valves, unless drain has integral backwater valve.

c. Install backwater valves in accessible locations.

D. Hanger and Support Installation:

1. Pipe Hangers:

a. Vertical Piping MSS Type 8 or Type 42, clamps.

b. Individual, Straight, Horizontal Piping Runs: According to the following:

1) 100 Feet and Less: MSS Type 1, adjustable, steel clevis hangers.

2) Longer than 100 Feet: MSS Type 43, adjustable roller hangers.

3) Longer than 100 Feet, if indicated: MSS Type 49, spring cushion rolls.

2. Install supports as required.

3. Support vertical piping and tubing at base and at each floor.

4. Rod diameter may be reduced one size for double-rod hangers, with 3/8-inch minimum rods.

5. Install hangers for cast-iron soil piping, steel piping and copper tubing with the following maximum horizontal spacing and minimum rod diameters as specified in UPC:

a. Install supports for vertical cast-iron soil piping, steel piping and copper piping as specified in UPC.

6. Support piping and tubing not listed above according to MSS SP-69 and manufacturer’s written instructions and meet the requirements of UPC.

E. Connections:

1. Connect soil and waste piping to exterior sanitary sewerage piping. Use transition fitting to join dissimilar piping materials.

2. Connect drainage and vent piping to the following:

a. Plumbing Fixtures: Connect drainage piping in sizes indicated, but not smaller than required by plumbing code.

b. Equipment: Connect atmospheric vent piping in sizes indicated, but not smaller than required by authorities having jurisdiction.

c. Plumbing Specialties: Connect drainage and vent piping in sizes indicated, but not smaller than required by plumbing code and specification section of Sanitary Waste Piping Specialties.

d. Equipment: Connect drainage piping as indicated. Provide shutoff valve, if indicated, and union for each connection. Use flanges instead of unions for connections NPS 2-1/2 and larger.

3.03 FIELD QUALITY CONTROL

A. During installation, notify Resident Engineer at least 24 hours before inspection shall be performed. Perform tests specified below in presence of Resident Engineer and the Authority having Jurisdiction (AHJ):

1. Roughing-in Inspection: Arrange for inspection of piping before concealing or closing-in after roughing-in and before setting fixtures.

2. Final Inspection: Arrange for final inspection by Resident Engineer and the AHJ to observe tests specified below and to ensure compliance with requirements.

3. Installation Verification shall apply prior to and before commissioning. Refer to commissioning of plumbing in other sections for verification documentation.

B. Reinspection: If Resident Engineer and the AHJ find that piping will not pass test or inspection, make required corrections and arrange for reinspection.

C. Reports: Prepare inspection reports and have them signed by Resident Engineer and the AHJ.

D. Test sanitary drainage and vent piping according to manufacturers' procedures of Resident Engineer and the AHJ:

1. Test installed drainage lines and equipment according to Section 22 08 00 - Commissioning of Plumbing. Provide and dispose of water required for testing.

2. Prepare reports for tests and required corrective action.

E. Components and installation shall be capable of withstanding the following minimum working pressure, unless otherwise indicated:

1. Soil, Waste, and Vent Piping: 10-foot head of water.

3.04 CLEANING

A. Clean interior of piping. Remove dirt and debris as work progresses.

B. Protect drains during remainder of construction period to avoid clogging with dirt and debris and to prevent damage from traffic and construction work.

C. Place plugs in ends of uncompleted piping at end of day and when work stops.

3.05 TRAINING

A. Engage a factory-authorized service representative to train Sound Transit's maintenance personnel to adjust, operate, and maintain Sanitary Waste and Vent Piping systems and equipment See Section 22 08 00 - Commissioning of Plumbing for commissioning requirements pertaining to the work of this section.

B. Engage a factory-authorized service representative to train Sound Transit's maintenance personnel to adjust, operate, and maintain Sanitary Waste and Vent Piping systems and equipment. See commissioning of plumbing in other sections for commissioning requirements pertaining to the work of this Section.

END OF SECTION

SECTION 23 05 00

COMMON WORK RESULTS FOR HVAC

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for the following:

a. Piping materials and installation instructions common to most piping systems.

b. Dielectric fittings.

c. Mechanical sleeve seals.

d. Sleeves.

e. Escutcheons.

f. Grout.

g. Equipment installation requirements common to equipment sections.

h. Concrete bases.

i. Supports and anchorages.

B. Any LEED execution requirements for HVAC are in accordance with the LEED certification requirements (including the LEED specifications matrix requirements) as stated elsewhere in the Contract Documents.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. ASME International (ASME):

a. ASME B1.20.1 Pipe Threads, General Purpose (Inch).

b. ASME B16.21 Nonmetallic Flat Gaskets for Pipe Flanges.

c. ASME B31.1 Power Piping.

2. ASTM International (ASTM):

a. ASTM A53/A53M Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.

b. ASTM B32 Standard Specification for Solder Metal.

c. ASTM B813 Standard Specification for Liquid and Paste Fluxes for Soldering of Copper and Copper Alloy Tube.

d. ASTM B828 Standard Practice for Making Capillary Joints by Soldering of Copper and Copper Alloy Tube and Fittings.

e. ASTM C1107/C1107M Standard Specification for Packaged Dry, Hydraulic-Cement Grout (Nonshrink).

f. ASTM D1785 Standard Specification for Poly(Vinyl Chloride) (PVC) Plastic Pipe, Schedules 40, 80 and 120.

g. ASTM D2564 Standard Specification for Solvent Cements of Poly(Vinyl Chloride) (PVC) Plastic Piping Systems.

h. ASTM D2657 Standard Practice for Heat Fusion Joining of Polyolefin Pipe and Fittings.

i. ASTM D2672 Standard Specification for Joints for IPS PVC Pipe Using Solvent Cement.

j. ASTM D2846/D2846M Standard Specification for Chlorinated Poly(Vinyl Chloride) (CPVC) Plastic Hot- and Cold-Water Distribution Systems.

k. ASTM D2855 Standard Practice for Making Solvent-Cemented Joints with Poly(Vinyl Chloride) (PVC) Pipe and Fittings.

l. ASTM D3139 Standard Specification for Joints for Plastic Pressure Pipes Using Flexible Elastomeric Seals.

m. ASTM D3212 Standard Specification for Joints for Drain and Sewer Plastic Pipes Using Flexible Elastomeric Seals.

n. ASTM F402 Standard Practice for Safe Handling of Solvent Cements, Primers, and Cleaners Used for Joining Thermoplastic Pipe and Fittings.

o. ASTM F493 Standard Specification for Solvent Cements for Poly(Vinyl Chloride) (PVC) Plastic Pipe and Fittings.

p. ASTM F656 Standard Specification for Primers for Use in Solvent Cement Joints of Poly(Vinyl Chloride) (PVC) Plastic Pipe and Fittings.

3. American Welding Society (AWS):

a. AWS A5.8/A5.8M Specification for Filler Metals for Brazing and Braze Welding.

b. AWS D1.1/D1.1M Structural Welding Code – Steel.

c. AWS D10.12M/D10.12 Guide for Welding Mild Steel Pipe.

4. Washington Association of Building Officials (WABO):

a. WABO Welder and Welding Operator Performance Qualification Standard (No. 27-13).

B. Definitions:

1. Finished Spaces: Spaces other than mechanical and electrical equipment rooms, furred spaces, pipe and duct chases, unheated spaces immediately below roof, spaces above ceilings, unexcavated spaces, and crawlspaces.

2. Exposed, Interior Installations: Exposed to view indoors. Examples include finished occupied spaces and mechanical equipment rooms.

3. Exposed, Exterior Installations: Exposed to view outdoors or subject to outdoor ambient temperatures and weather conditions. Examples include rooftop locations.

4. Concealed, Interior Installations: Concealed from view and protected from physical contact by building occupants. Examples include above ceilings and chases.

5. Concealed, Exterior Installations: Concealed from view and protected from weather conditions and physical contact by building occupants but subject to outdoor ambient temperatures. Examples include installations within unheated shelters.

1.03 SUBMITTALS

A. Submit the following:

1. Sustainability Submittals in accordance with the LEED certification requirements (including the LEED specifications matrix requirements), and Sound Transit Sustainability Checklist as stated elsewhere in the Contract Documents.:

a. Low Emitting Materials - Product data for all adhesives, sealants, paints and coatings applied within the weather barrier indicating:

1) Product meets California Department of Public Health (CDPH) standard method v1.1-2010 testing requirements.

2) VOC content in g/L meeting SCAQMD Rules #1168 (adhesives and sealants) and #1113 (paints and coatings) VOC requirements.

3) Amount of product to be used within the weather barrier.

B. Transmit the following:

1. Welding certificates.

2. Shop drawings.

1.04 QUALITY ASSURANCE

A. Materials and Work:

1. Materials and equipment required for the work shall be new and shall be furnished, delivered, erected, installed, connected, and finished in every detail; and shall be selected and arranged to fit properly into the building spaces. Where no specific kind or quality of material is given, an article as approved by the Resident Engineer shall be provided.

2. Furnish the services of an experienced superintendent, who shall be constantly in charge of the work.

B. Shop Drawings: Provide scaled shop drawings, indicating coordination with other trades, maintenance clearance and adequate room for equipment installation.

C. Steel Support Welding: Certified WABO welders. Qualify processes and operators according to WABO Standard No. 27-13.

D. Steel Pipe Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications.":

1. Comply with provisions in ASME B31.1.

2. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.

E. Coordination:

1. Provide control and electrical wiring details including power supply connections for any dry systems requiring power and control or any electrically activated valves that require interface with control systems.

2. Drawings are diagrammatic, indicating the general arrangement of systems and work. Examine the architectural drawings for exact location of fixtures and equipment. Where they are not definitely located, obtain this information from the Resident Engineer.

3. Follow drawings in laying out work and check drawings of other trades to verify spaces in which work will be installed. Maintain maximum headroom. If space conditions appear inadequate, notify the Resident Engineer before proceeding with the work. Make reasonable modifications in the work without extra cost as needed to prevent conflict with work of other trades and for proper execution of the work.

F. Cooperation with Other Trades

1. Give full cooperation to other trades and furnish in writing to other trades, with copies to the Resident Engineer, any information necessary to permit the work of all trades to be installed satisfactorily and with the least possible interference or delay.

2. Plumbing contractor must inspect and accept the installation work area and furnish in writing to the prime contractor with copies to Resident Engineer prior to starting the installation work.

3. Where plumbing work will be installed in close proximity to, or will interfere with work of other trades, assist in working out space conditions to make a satisfactory adjustment. If work is installed before coordinating with other trades, or if it causes any interference with work of other trades, make the necessary changes in the work to correct the conditions and bear all costs.

4. Furnish to other trades necessary templates, patterns, setting drawings and shop details for the proper installation of work and for coordinating adjacent work. This includes participation and support of any Building Information Modeling efforts associated with this contract.

G. Record Documentation:

1. "As-built" drawings shall comply with as-built specification section 01 78 39 in this contract and shall include as a minimum the location and performance data on each piece of equipment, general configuration of pipe and ductwork distribution system, including sizes, and design flow rates of the actual installation. "As-built" drawings shall also incorporate any mechanical work which deviates from the contract drawings, including changes resulting from addenda, Requests for Information, and Change Orders. As-built drawings must show the work clearly in the actual locations as built.

H. Operating Instructions:

1. Provide operating and maintenance instructions in accordance with Division 01 Operation and Maintenance Data specification:

a. System/Equipment overview (what it is, what it does and which other systems and/or equipment does it interface with).

b. Review of the available operations and maintenance (O&M) materials in accordance with Division 01 Operation and Maintenance Data specification.

c. Review of the Record Drawings on the subject system/equipment, including valve schedules and zone distribution.

2. Hands-on demonstration of all normal maintenance procedures, normal operating modes, and all emergency shutdown and startup procedures.

I. Electrical Characteristics for HVAC Equipment: Equipment of higher electrical characteristics may be furnished provided such proposed equipment is approved in writing and connecting electrical services, circuit breakers, and conduit sizes are appropriately modified. If minimum energy ratings or efficiencies are specified, equipment shall comply with requirements.

PART 2 - PRODUCTS

2.01 PIPE, TUBE, AND FITTINGS

A. Refer to HVAC requirements as stated elsewhere in the Contract Documents for pipe, tube, and fitting materials and joining methods.

B. Pipe Threads: ASME B1.20.1 for factory-threaded pipe and pipe fittings.

2.02 JOINING MATERIALS

A. Refer to HVAC requirements as stated elsewhere in the Contract Documents for special joining materials not listed below.

B. Pipe-Flange Gasket Materials: ASME B16.21, nonmetallic, flat, asbestos-free, 1/8-inch maximum thickness unless thickness or specific material is indicated.

C. Plastic, Pipe-Flange Gasket, Bolts, and Nuts: Type and material recommended by piping system manufacturer, unless otherwise indicated.

D. Solder Filler Metals: ASTM B32, lead-free alloys. Include water-flushable flux according to ASTM B813.

E. Brazing Filler Metals: AWS A5.8/A5.8M, BCuP Series or BAg1, unless otherwise indicated.

F. Welding Filler Metals: Comply with AWS D10.12M/D10.12.

G. Solvent Cements for Joining Plastic Piping:

1. CPVC Piping: ASTM F493.

2. PVC Piping: ASTM D2564. Include primer according to ASTM F656.

H. Adhesives and sealants applied within the weather barrier shall meet VOC and general emissions testing requirements in accordance with the LEED certification requirements (including the LEED specifications matrix requirements), and Sound Transit Sustainability Checklist as stated elsewhere in the Contract Documents.:

2.03 DIELECTRIC FITTINGS

A. Description: Combination fitting of copper alloy and ferrous materials with threaded, solder-joint, plain, or weld-neck end connections that match piping system materials.

B. Insulating Material: Suitable for system fluid, pressure, and temperature.

C. Dielectric Unions: Factory-fabricated, union assembly, for 250 pounds per square inch gauge minimum working pressure at 180 degrees Fahrenheit.

D. Dielectric Flanges: Factory-fabricated, companion-flange assembly, for 150 or 300 pounds per square inch gauge minimum working pressure as required to suit system pressures.

E. Dielectric Couplings: Galvanized-steel coupling with inert and noncorrosive, thermoplastic lining; threaded ends; and 300 pounds per square inch gauge minimum working pressure at 225 degrees Fahrenheit.

F. Dielectric Nipples: Electroplated steel nipple with inert and noncorrosive, thermoplastic lining; plain, threaded, or grooved ends; and 300 pounds per square inch gauge minimum working pressure at 225 degrees Fahrenheit.

2.04 MECHANICAL SLEEVE SEALS

A. Description: Modular sealing element unit, designed for field assembly, to fill annular space between pipe and sleeve.

B. Sealing Elements: EPDM interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.

C. Pressure Plates: Stainless steel. Include two for each sealing element.

D. Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements. Include one for each sealing element.

2.05 SLEEVES

A. Galvanized-Steel Sheet: 0.0239-inch minimum thickness; round tube closed with welded longitudinal joint.

B. Steel Pipe: ASTM A53/A53M, Type E, Grade B, Schedule 40, galvanized, plain ends.

C. Cast Iron: Cast or fabricated "wall pipe" equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop, unless otherwise indicated.

D. Stack Sleeve Fittings: Manufactured, cast-iron sleeve with integral clamping flange. Include clamping ring and bolts and nuts for membrane flashing.

E. Underdeck Clamp: Clamping ring with set screws.

F. Molded PE: Reusable, PE, tapered-cup shaped, and smooth-outer surface with nailing flange for attaching to wooden forms.

2.06 ESCUTCHEONS

A. Description: Manufactured wall and ceiling escutcheons and floor plates, with an ID to closely fit around pipe, tube, and insulation of insulated piping and an OD that completely covers opening.

B. One-Piece, Deep-Pattern Type: Deep-drawn, box-shaped brass with polished chrome- plated finish.

C. One-Piece, Cast-Brass Type: With set screw:

1. Finish: Polished chrome-plated and rough brass.

D. Split-Casting, Cast-Brass Type: With concealed hinge and set screw:

1. Finish: Polished chrome-plated.

2.07 GROUT

A. Description: ASTM C1107/C1107M, Grade B, nonshrink and nonmetallic, dry hydraulic-cement grout.

1. Characteristics: Post-hardening, volume-adjusting, nonstaining, noncorrosive, nongaseous, and recommended for interior and exterior applications.

2. Design Mix: 5000 pounds per square inch, 28-day compressive strength.

3. Packaging: Premixed and factory packaged.

B. Grout applied within the weather barrier shall meet VOC and general emissions testing requirements in accordance with LEED certification requirements (including the LEED specifications matrix requirements) and Sound Transit Sustainability Checklist as stated elsewhere in the Contract Documents

PART 3 - EXECUTION

3.01 PIPING SYSTEMS – COMMON REQUIREMENTS

A. Install piping according to HVAC requirements as stated elsewhere in the Contract Documents specifying piping systems.

B. Contract Drawings, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.

C. Install piping in concealed locations, unless otherwise indicated and except in equipment rooms and service areas.

D. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

E. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

F. Install piping to permit valve servicing.

G. Install piping at indicated slopes.

H. Install piping free of sags and bends.

I. Install fittings for changes in direction and branch connections.

J. Install piping to allow application of insulation.

K. Select system components with pressure rating equal to or greater than system operating pressure.

L. Install escutcheons for penetrations of walls, ceilings, and floors.

M. Install sleeves for pipes passing through concrete and masonry walls, gypsum-board partitions, and concrete floor and roof slabs.

N. Aboveground, Exterior-Wall Pipe Penetrations: Seal penetrations using sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.

1. Install steel pipe for sleeves smaller than 6 inches in diameter.

2. Install cast-iron "wall pipes" for sleeves 6 inches and larger in diameter.

3. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

O. Underground, Exterior-Wall Pipe Penetrations: Install cast-iron "wall pipes" for sleeves. Seal pipe penetrations using mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.

P. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

Q. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials. Refer to firestopping requirements as stated elsewhere in the Contract Documents, for materials.

R. Verify final equipment locations for roughing-in.

S. Refer to equipment specifications in other Sections of these Contract Documents for roughing-in requirements.

3.02 PIPING JOINT CONSTRUCTION

A. Join pipe and fittings according to HVAC requirements as stated elsewhere in the Contract Documents specifying piping systems.

B. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

C. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

D. Soldered Joints: Apply ASTM B813, water-flushable flux, unless otherwise indicated, to tube end. Construct joints according to ASTM B828 or Copper Development Association's "Copper Tube Handbook," using lead-free solder alloy complying with ASTM B32.

E. Brazed Joints: Construct joints according to AWS's "Brazing Handbook," "Pipe and Tube" Chapter, using copper-phosphorus brazing filler metal complying with AWS A5.8/A5.8M.

F. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:

1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.

2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

G. Welded Joints: Construct joints according to AWS D10.12M/D10.12, using qualified processes and welding operators according to Article 1.04, herein.

H. Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.

I. Plastic Piping Solvent-Cement Joints: Clean and dry joining surfaces. Join pipe and fittings according to the following:

1. Comply with ASTM F402, for safe-handling practice of cleaners, primers, and solvent cements.

2. CPVC Piping: Join according to ASTM D2846/D2846M Appendix.

3. PVC Pressure Piping: Join schedule number ASTM D1785, PVC pipe and PVC socket fittings according to ASTM D2672. Join other-than-schedule-number PVC pipe and socket fittings according to ASTM D2855.

4. PVC Nonpressure Piping: Join according to ASTM D2855.

J. Plastic Pressure Piping Gasketed Joints: Join according to ASTM D3139.

K. Plastic Nonpressure Piping Gasketed Joints: Join according to ASTM D3212.

L. PE Piping Heat-Fusion Joints: Clean and dry joining surfaces by wiping with clean cloth or paper towels. Join according to ASTM D2657.

1. Plain-End Pipe and Fittings: Use butt fusion.

2. Plain-End Pipe and Socket Fittings: Use socket fusion.

M. Fiberglass Bonded Joints: Prepare pipe ends and fittings, apply adhesive, and join according to pipe manufacturer's written instructions.

3.03 PIPING CONNECTIONS

A. Make connections according to the following, unless otherwise indicated:

1. Install unions, in piping NPS 2 and smaller, adjacent to each valve and at final connection to each piece of equipment.

2. Install flanges, in piping NPS 2-1/2 and larger, adjacent to flanged valves and at final connection to each piece of equipment.

3. Dry Piping Systems: Install dielectric unions and flanges to connect piping materials of dissimilar metals.

4. Wet Piping Systems: Install dielectric coupling and nipple fittings to connect piping materials of dissimilar metals.

3.04 EQUIPMENT INSTALLATION – COMMON REQUIREMENTS

A. Install equipment to allow maximum possible headroom unless specific mounting heights are not indicated.

B. Install equipment level and plumb, parallel and perpendicular to other building systems and components in exposed interior spaces, unless otherwise indicated.

C. Install HVAC equipment to facilitate service, maintenance, and repair or replacement of components. Connect equipment for ease of disconnecting, with minimum interference to other installations. Extend grease fittings to accessible locations.

D. Install equipment to allow right of way for piping installed at required slope.

3.05 CONCRETE BASES

A. Anchor equipment to concrete base according to equipment manufacturer's written instructions and according to Authority having Jurisdiction Seismic Codes, and Division 03 Anchorage to Concrete Specification.

1. Construct concrete bases of dimensions indicated, but not less than 4 inches larger in both directions than supported unit with chamfer edges.

2. Install dowel rods to connect concrete base to concrete floor as shown on structural drawings.

3. Install Type 304 stainless steel anchors for supporting equipment that extends through concrete base, and anchors into structural concrete floor. Provide dielectric insulation between dissimilar metals.

4. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.

5. Install anchor bolts to elevations required for proper attachment to supported equipment.

6. Install anchor bolts according to anchor-bolt manufacturer's written instructions.

7. Use 4,000-psi, 28-day compressive-strength concrete.

B. Contractor responsible for anchoring equipment to pad according to vibration and seismic controls for HVAC piping and equipment specification of this project.

3.06 ERECTION OF METAL SUPPORTS AND ANCHORAGES

A. Refer to metal fabrications requirements as stated elsewhere in the Contract Documents, for structural steel.

B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor HVAC materials and equipment.

C. Field Welding: Comply with AWS D1.1/D1.1M.

3.07 ERECTION OF WOOD SUPPORTS AND ANCHORAGES

A. Cut, fit, and place wood grounds, nailers, blocking, and anchorages to support, and anchor HVAC materials and equipment.

B. Select fastener sizes that will not penetrate members if opposite side will be exposed to view or will receive finish materials. Tighten connections between members. Install fasteners without splitting wood members.

C. Attach to substrates as required to support applied loads.

3.08 GROUTING

A. Mix and install grout as specified in the requirements of non-shrink grouting as stated elsewhere in the Contract Documents, for HVAC equipment base bearing surfaces, pump and other equipment base plates, and anchors.

B. Clean surfaces that will come into contact with grout.

C. Provide forms as required for placement of grout.

D. Avoid air entrapment during placement of grout.

E. Place grout, completely filling equipment bases.

F. Place grout on concrete bases and provide smooth bearing surface for equipment.

G. Place grout around anchors.

H. Cure placed grout.

3.09 COMMISSIONING

A. See commissioning of HVAC systems requirements as stated elsewhere in the Contract Documents, for commissioning requirement pertaining to the work of this Section.

B. In addition to commissioning required elsewhere in the Contract Documents, the systems and equipment included in this section shall be subject to commissioning process activities in accordance to LEED requirements for commissioning of HVAC (including the LEED specifications matrix requirements) as stated elsewhere in the Contract Documents

END OF SECTION

SECTION 23 05 17

SLEEVES AND SLEEVE SEALS FOR HVAC PIPING

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for the following:

a. Sleeves.

b. Stack-sleeve fittings.

c. Sleeve-seal systems.

d. Sleeve-seal fittings.

e. Grout.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. ASTM International (ASTM):

a. ASTM A53.

b. ASTM E84/E814.

c. ASTM A377.

d. ASTM A-653.

e. ASTM A-888.

f. ASTM C1107.

g. ASME B36.10.

2. Underwriter Laboratories (UL):

a. UL (FRD) – Fire Resistance.

1.03 SUBMITTALS

A. Transmit:

1. Product Data: For each type of product indicated.(Submittals shall be reviewed by HVAC and Structurak EOR for applicability.)

PART 2 - PRODUCTS

2.01 COMPONENTS

A. Sleeves:

1. Cast-Iron Wall Pipes: ASTM A377, Cast or fabricated of cast or ductile iron and equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop unless otherwise indicated.

2. Cast Iron Pipe sleeves: ASTM A-888 Cast Iron pipe with plain ends.

3. Galvanized-Steel Wall Pipes: ASTM A 53/A 53M, Schedule 40, with plain ends and welded steel collar; zinc coated Or equal corrosion inhibitor coating.

4. Galvanized-Steel-Pipe Sleeves: ASTM A 53/A 53M, Type E, Grade B, Schedule 40, zinc coated, with plain ends.

5. Galvanized-Steel-Sheet Sleeves: ASTM A653, 0.0239-inch minimum thickness; round tube closed with welded longitudinal joint.

B. Stack-Sleeve Fittings:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. Jay R Smith. Mfg. Co.

b. Wade.

c. Zurn.

2. Description: Manufactured cast-iron sleeve with integral clamping flange. Include clamping ring, bolts, and nuts for membrane flashing:

a. Underdeck Clamp: Clamping ring with setscrews.

C. Sleeve-Seal Systems:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. Advance Products & Systems, Inc.

b. CALPICO, Inc.

c. Metraflex Company (The).

d. Link-Seal.

e. Pipeline Seal and Insulator, Inc.

f. Proco Products, Inc.

2. Description: Modular sealing-element unit, designed for field assembly, for filling annular space between piping and sleeve:

a. An assembly consisting of a stainless steel frame, a compression mechanism, and insert modules for pipe, duct and tubing.

b. Comply with F- and T-ratings as required by local codes, code official, and as tested in accordance with ASTM E814 or UL1479.

c. Sealing Elements: EPDM-rubber interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.

d. Designs should be water and gas tight to 14.5 psi.

e. Seals shall be asbestos free, lead free, halogen free

f. Pressure Plates: Reinforced Nylon Polymer or Stainless steel.

g. Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements.

D. Sleeve-Seal Fittings:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. HoldRite.

b. The Metraflex Company.

c. Pipeline Seal and Insulator, Inc.

2. Description: Manufactured plastic, sleeve-type, waterstop assembly made for imbedding in concrete slab or wall. Unit has plastic or rubber waterstop collar with center opening to match piping OD.

E. Grout:

1. Standard: ASTM C 1107/C 1107M, Grade B, post-hardening and volume-adjusting, dry, hydraulic-cement grout.

2. Characteristics: Nonshrink; recommended for interior and exterior applications.

3. Design Mix: 5000-psi, 28-day compressive strength.

4. Packaging: Premixed and factory packaged.

PART 3 - EXECUTION

3.01 SLEEVE INSTALLATION

A. Install sleeves for piping passing through penetrations in floors, partitions, roofs, and walls. Provide waterproof flashing through exterior above grade roof.

B. For sleeves that will have sleeve-seal system installed, select sleeves of size large enough to provide 1-inch annular clear space between piping and concrete slabs and walls. Sleeves shall be two inches larger than proposed pipe diameter:

1. Sleeves are not required for core-drilled holes.

C. Install sleeves in concrete floors, concrete roof slabs, and concrete walls as new slabs and walls are constructed:

1. Permanent sleeves are not required for holes in slabs formed by molded-PE or -PP sleeves.

2. Cut sleeves to length for mounting flush with both surfaces:

   a. Exception: Extend sleeves installed in floors of mechanical equipment areas or other wet areas 2 inches above finished floor level.

3. Using grout, seal the space outside of sleeves in slabs and walls without sleeve-seal system.

D. Install sleeves for pipes passing through interior partitions:

1. Cut sleeves to length for mounting flush with both surfaces.

2. Install sleeves that are large enough to provide 1/4-inch annular clear space between sleeve and pipe or pipe insulation.

3. Seal annular space between sleeve and piping or piping insulation; use joint sealants appropriate for size, depth, and location of joint. Comply with applicable codes and standards requirements for sealants.

E. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials. Comply with applicable codes and standards requirements for fire stopping.

3.02 STACK-SLEEVE-FITTING INSTALLATION

A. Install stack-sleeve fittings in new slabs as slabs are constructed:

1. Install fittings that are large enough to provide 1/4-inch annular clear space between sleeve and pipe or pipe insulation.

2. Secure flashing between clamping flanges for pipes penetrating floors with membrane waterproofing. Comply with requirements for flashing as specified elsewhere in the Contract Documents. applicable codes and standard for flashing.

3. Install section of cast-iron soil pipe to extend sleeve to 2 inches above finished floor level.

4. Extend cast-iron sleeve fittings below floor slab as required to secure clamping ring if ring is specified.

5. Using grout, seal the space around outside of stack-sleeve fittings. Comply with applicable codes and standards requirements for joint sealants.

B. Fire-Barrier Penetrations: Maintain indicated fire rating of floors at pipe penetrations. Seal pipe penetrations with firestop materials. Comply with applicable codes and standards requirements for fire stopping.

3.03 SLEEVE-SEAL-SYSTEM INSTALLATION

A. Install sleeve-seal systems in sleeves in exterior concrete walls above and below grade and slabs-on-grade at service piping entries into building.

B. Select type, size, and number of sealing elements required for piping material and size and for sleeve ID or hole size. Position piping in center of sleeve. Center piping in penetration, assemble sleeve-seal system components, and install in annular space between piping and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make a watertight seal.

C. Fire-Barrier Penetrations: Maintain indicated fire rating of wall, floor at pipe penetrations. Seal pipe penetrations with firestop materials. Comply with requirements for firestopping as specified in this specification section.

3.04 SLEEVE-SEAL-FITTING INSTALLATION

A. Install sleeve-seal fittings in new walls and slabs as they are constructed.

B. Assemble fitting components of length to be flush with both surfaces of concrete slabs and walls. Position waterstop flange to be centered in concrete slab or wall.

C. Secure nailing flanges to concrete forms.

D. Using grout, seal the space around outside of sleeve-seal fittings.

E. Fire-Barrier Penetrations: Maintain indicated fire rating of wall, floor at pipe penetrations. Seal pipe penetrations with firestop materials. Comply with applicable codes and standards requirements for firestopping.

3.05 SLEEVE AND SLEEVE-SEAL SCHEDULE

A. Use sleeves and sleeve seals for the following piping-penetration applications:

1. Concrete structural elements (Not covered elsewhere in sleeve and sleeve-seal schedule):

a. Piping Smaller Than NPS 6: Cast-iron pipe sleeves.

b. Piping NPS 6 and Larger: Cast-iron pipe sleeves.

2. Exterior Concrete Walls above Grade:

a. Piping Smaller Than NPS 6: Cast-iron wall pipe sleeves with sleeve-seal system.

B. Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve seal system:

a. Piping NPS 6 and Larger: Cast-iron wall pipe sleeves with sleeve-seal system

C. Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve seal system:

1. Exterior Concrete Walls below Grade:

a. Piping Smaller Than NPS 6: Cast-iron wall pipe sleeves with sleeve-seal system:

1) Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve-seal system.

b. Piping NPS 6 and Larger: Cast-iron wall pipe sleeves with sleeve-seal system:

1) Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve-seal system.

2. Concrete Slabs-on-Grade:

   a. Piping Smaller Than NPS 6: Cast-iron pipe wall sleeves with sleeve-seal system:

      1) Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve-seal system.

   b. Piping NPS 6 and Larger: Cast-iron wall pipe sleeves with sleeve-seal system:

      1) Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve-seal system.

3. Concrete Slabs above Grade:

   a. Piping Smaller Than NPS 6: Galvanized-steel-pipe sleeves Stack-sleeve fittings.

   b. Piping NPS 6 and Larger: Galvanized-steel-pipe sleeves Stack-sleeve fittings.

4. Interior Partitions:

   a. Piping Smaller Than NPS 6: Galvanized-steel-pipe sleeves.

   b. Piping NPS 6 and Larger: Galvanized-steel-sheet sleeves.

END OF SECTION

SECTION 23 05 53

IDENTIFICATION FOR HVAC PIPING AND EQUIPMENT

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for the following:

a. Equipment labels.

b. Warning signs and labels.

c. Pipe labels.

d. Duct labels.

e. Stencils.

f. Valve tags.

g. Valve Labels.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. ANSI/ASME International:

a. ANSI/ASME A13.1 Scheme for Identification of Piping Systems.

1.03 SUBMITTALS

A. Submit:

1. Product Data: For each type of product indicated.

2. Samples: For color, letter style, and graphic representation required for each identification material and device.

3. Equipment Label Schedule: Include a listing of all equipment to be labeled with the proposed content for each label.

4. Valve Schedules with numbering scheme: For each piping system to include in maintenance manuals.

1.04 QUALITY ASSURANCE

A. Coordination:

1. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied.

2. Coordinate installation of identifying devices with locations of access panels and doors.

3. Install identifying devices before installing acoustical ceilings and similar concealment.

PART 2 - PRODUCTS

2.01 COMPONENTS

A. Equipment Labels:

1. Material and Thickness: Multilayer, multicolor, plastic labels for mechanical engraving, 1/8 inch thick, and having predrilled holes for attachment hardware if the label is to be mounted with fasteners.

2. Letter Color: Black.

3. Background Color: White.

4. Maximum Temperature: Able to withstand temperatures up to 160 degrees Fahrenheit.

5. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch.

6. Minimum Letter Size: 1/2 inch for name of units for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. If needed include secondary lettering two-thirds to three-fourths the size of principal lettering.

7. Fasteners: Stainless-steel self-tapping screws.

8. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.

9. Label Content: Include equipment’s Contract Drawing designation or unique equipment number.

B. Warning and Labels:

1. Material and Thickness: Multilayer, multicolor, plastic labels for mechanical engraving, 1/8 inch thick, and having predrilled holes for attachment hardware if the label is to be mounted with fasteners.

2. Letter Color: White.

3. Background Color: Red.

4. Maximum Temperature: Able to withstand temperatures up to 160 degrees Fahrenheit.

5. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch.

6. Minimum Letter Size: 1/2 inch for name of units for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. If needed include secondary lettering 2/3 to 3/4 the size of principal lettering.

7. Fasteners: Stainless-steel self-tapping screws.

8. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.

9. Label Content: Include caution and warning information, plus emergency notification instructions.

C. Pipe Labels:

1. General Requirements for Manufactured Pipe Labels: Preprinted, color-coded, with lettering indicating service, and showing flow direction.

2. Pretensioned Pipe Labels: Precoiled, semirigid plastic formed to partially cover circumference of pipe and to attach to pipe without fasteners or adhesive.

3. Self-Adhesive Pipe Labels: Printed plastic with contact-type, permanent-adhesive backing.

4. Pipe Label Schedule:

a. Label Letter Color: Follow color scheme per ANSI/ASME standard A13.1:

1) Label Background Color: Follow color scheme per ANSI/ASME standard A13.1

5. Pipe Label Contents: Include identification of piping service using same designations or abbreviations as used on Drawings, pipe size, and an arrow indicating flow direction.

a. Flow-Direction Arrows: Integral with piping system service lettering to accommodate both directions or as separate unit on each pipe label to indicate flow direction.

D. Lettering Size: Minimum text height per ANSI/ASME 13.1Duct Labels:

1. Material and Thickness: Multilayer, multicolor, plastic-laminated self-adhesive labels, 1/8 inch thick.

2. Letter Color: White.

3. Background Color in the following color codes:

a. Blue: Supply air and mixed-air ducts.

b. Yellow: Hot-air supply ducts.

c. Green: For exhaust, outside-, relief-, and return ducts.

d. ANSI/ASME A13.1 Colors and Designs: For hazardous material exhaust.

4. Maximum Temperature: Able to withstand temperatures up to 160 degrees Fahrenheit.

5. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch.

6. Minimum Letter Size: 1/2 inch for name of units for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. If needed include secondary lettering 2/3 to 3/4 the size of principal lettering.

7. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.

8. Duct Label Contents: Include identification of duct service using same designations or abbreviations as used on Drawings, duct size, and an arrow indicating flow direction:

    a. Flow-Direction Arrows: Integral with duct system service lettering to accommodate both directions or as separate unit on each duct label to indicate flow direction.

E. Stencils:

1. Stencils: Prepared with letter sizes according to ANSI/ASME A13.1 for piping; minimum letter height of 1-1/4 inches for ducts; and minimum letter height of 3/4 inch for access panel and door labels, equipment labels, and similar operational instructions:

    a. Stencil Material: Aluminum.

    b. Stencil Paint: Exterior, gloss, alkyd enamel black unless otherwise indicated. Paint may be in pressurized spray-can form.

    c. Identification Paint: Exterior, alkyd enamel in colors according to ANST/ASME A13.1 unless otherwise indicated.

F. Valve Tags:

1. Valve Tags: Stamped or engraved with 1/4-inch letters for piping system abbreviation and 1/2-inch numbers:

    a. Tag Material: Brass, 0.032-inch minimum thickness, and having predrilled or stamped holes for attachment hardware.

    b. Fasteners: Brass wire-link or beaded chain; or S-hook.

2. Valve-Tag Application Schedule: Tag valves according to size, shape, and color scheme and with captions similar to those indicated in the following subparagraphs:

    a. Valve-Tag Size and Shape:

        1) Hydronic and Refrigerant: 1-1/2 inches, round.

    b. Valve-Tag Color:

        1) Hydronic and Refrigerant: Natural.

    c. Letter Color:

        1) Hydronic and Refrigerant: Black.

3. Valve Schedules: For each piping system, on 8-1/2-by-11-inch bond paper. Tabulate valve number, piping system, system abbreviation (as shown on valve tag), location of valve (room or space), normal-operating position (open, closed, or modulating), and variations for identification. Mark valves for emergency shutoff and similar special uses:

    a. Valve-tag schedule shall be included in operation and maintenance data and hard copy on site, final location to be determined by ST.

G. Valve Labels:

1. Material and Thickness: Multilayer, multicolor, plastic-laminated labels for mechanical engraving, 1/8 inch thick, self-adhesive label or having predrilled holes for attachment hardware if the label to be mounted with fasteners.

2. Valve Label Schedule Valve Label Application Schedule: Valves label according to size, shape, and color scheme and with captions similar to those indicated in the following subparagraphs:

a. Valve Label Size and Shape:

1) Hydronic and Refrigerant: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch.

2) Minimum Letter Size: 1/2 inch for name of valves for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. If needed include secondary lettering two-thirds to three-fourths the size of principal lettering.

3. Maximum Temperature: Able to withstand temperatures up to 160 degrees Fahrenheit.

4. Fasteners: Stainless-steel self-tapping screws.

5. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate

PART 3 - EXECUTION

3.01 IDENTIFICATION INSTALLATION PREPARATION

A. Clean piping and equipment surfaces of substances that could impair bond of identification devices, including dirt, oil, grease, release agents, and incompatible primers, paints, and encapsulants.

3.02 IDENTIFICATION INSTALLATION

A. Equipment Label Installation:

1. Install or permanently fasten labels on each major item of mechanical equipment.

2. Locate equipment labels where accessible and visible.

B. Pipe Label Installation:

1. Piping Color-Coding: Painting of piping shall be per the requirements of high-performance coatings as specified elsewhere in the Contract Documents.

2. Stenciled Pipe Label Option: Stenciled labels may be provided instead of manufactured pipe labels, at Installer's option. Install stenciled pipe labels, complying with ANSI/ASME A13.1, on each piping system:

a. Identification Paint: Use for contrasting background.

b. Stencil Paint: Use for pipe marking.

3. Locate pipe labels where piping is exposed or above accessible ceilings in finished spaces; machine rooms; accessible maintenance spaces such as shafts, tunnels, and plenums; and exterior exposed locations as follows:

   a. Near each valve and control device.

   b. Near each branch connection, excluding short takeoffs for fixtures and terminal units. Where flow pattern is not obvious, mark each pipe at branch.

   c. Near penetrations through walls, floors, ceilings, and inaccessible enclosures.

   d. At access doors, manholes, and similar access points that permit view of concealed piping.

   e. Near major equipment items and other points of origination and termination.

   f. Spaced at maximum intervals of 50 feet along each run. Reduce intervals to 25 in areas of congested piping and equipment.

   g. On piping above removable acoustical ceilings. Omit intermediately spaced labels.

C. Duct Label Installation:

1. Install plastic-laminated self-adhesive duct labels with permanent adhesive on air ducts.

2. Stenciled Duct Label Option: Larger sized stenciled labels, showing service and flow direction may be provided instead of plastic-laminated duct labels, at Installer's option, if lettering larger than 1 inch high is needed for proper identification because of distance from normal location of required identification.

3. Locate labels near points where ducts enter into concealed spaces and at maximum intervals of 50 feet in each space where ducts are exposed or concealed by removable ceiling system. Reduced intervals to 25 feet in areas of congested piping and equipment.

D. Valve-Tag And Valve Label Installation:

1. Valve-Tag Installation:

   a. Install tags on valves and control devices in piping systems, except check valves; valves within factory-fabricated equipment units; shutoff valves; faucets; convenience and lawn-watering hose connections; and HVAC terminal devices and similar roughing-in connections of end-use fixtures and units. List tagged valves in a valve schedule.

2. Valve Label Installation:

   a. As an option, valve label in place of valve tags can be installed on wall or column not more than 6 inches behind the valve. Install valve label for valves and control devices in piping systems, except check valves; valves within factory-fabricated equipment units; shutoff valves, and HVAC terminal devices and similar roughing-in connections of end-use fixtures and units. List valve labels in a valve schedule.

END OF SECTION

SECTION 23 08 00

COMMISSIONING OF HVAC SYSTEMS

NOTE TO DESIGNER:

SECTIONS WITH BRACKETS. E.G. (TEXT) ARE TO BE MODIFIED OR DELETED IF NOT APPLICABLE. ITALICIZED TEXT PROVIDES INSTRUCTION TO THE DESIGNER TO INCLUDE LANGUAGE ON SPECIFIC TOPIC WHEN APPLICABLE. THE INSTRUCTIONS ARE TO BE DELETED WHEN THE SPECIFICATION IS FINALIZED. LANGUAGE NOT IN BRACKETS IS TO BE USED AS IS WITHOUT MODIFICATION OR WITH AN APPROVED SPECIFICATION MODIFICATION REQUEST.

DESIGNER TO DELETE TEXT ABOVE FOR FINAL SECTION

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Requirements for the commissioning process for HVAC, including:

a. Level 1 commissioning activities for HVAC.

b. Level 2 commissioning activities for HVAC.

c. Support for Level 3 commissioning activities related to HVAC.

d. Support for Level 4 commissioning activities related to HVAC.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. American Society of Heating, Refrigerating and Air Conditioning Engineers (ASHRAE):

a. ASHRAE Guideline 0-2005, The Commissioning Process (including Amendments).

2. Sheet Metal and Air Conditioning Contractors' National Association (SMACNA):

a. SMACNA HVAC Air Duct Leakage Test Manual (1st Edition).

B. Definitions:

1. See general commissioning requirements as stated elsewhere in the Contract Documents for commissioning definitions.

2. Systems, Equipment, and Components: Where these terms are used together or separately, they shall mean "as-built" systems, equipment, and components.

3. Command: When used in the description of a commissioning activity, command means to use the station human machine interface (HMI) for the building management system (BMS) to control systems, equipment and components.

4. Human Machine Interface (HMI): Equipment, software, and functional programming at the locations shown on the Plans.

1.03 COORDINATION

A. See general commissioning requirements Section 01 91 13 – General Systems Testing and Commissioning Requirements and as stated elsewhere in the Contract Documents for general coordination requirements related to commissioning.

1.04 COMMISSIONING ACTIVITIES

A. Furnish labor and material to accomplish building commissioning as specified in general commissioning requirements as stated elsewhere in the Contract Documents, and herein, including:

1. Provide to the Testing and Commissioning Manager preliminary O&M information for use in developing commissioning test procedures.

2. Assist the Testing and Commissioning Manager in developing commissioning activity procedures and data forms submittals for work specified in this Section.

3. Provide information to the Testing and Commissioning Manager needed for control interface wiring diagrams submittals for the work of this Section.

4. Perform Level 1 and Level 2 commissioning activities specified in this Section, including installation verification, static tests, start-up, component tests, equipment tests, systems tests, and intrastation system interface tests.

5. Provide support for Level 3 commissioning activities, including jointly with the communications system contractor field testing points in the interface terminal strips, being present during level 3 testing with adequate labor and support personnel to adjust equipment and troubleshoot system failures that might arise. When material or equipment provided by this Division is found to be in conflict with specified criteria, adjust or replace said material or equipment, with the assistance of manufacturer as needed.

6. Operate equipment and system during commissioning activities as required by the Testing and Commissioning Manager .

7. Perform and document commissioning tests to verify readiness for commissioning test demonstration. Commissioning tests are specified herein.

8. Correct issues and repeat commissioning tests when results do not meet acceptance criteria.

9. Commissioning Test Demonstrations: General requirements for commissioning test demonstrations are specified in general commissioning requirements, as stated elsewhere in the Contract Documents:

    a. Repeat commissioning tests on a sample basis to demonstrate acceptable performance: Level 1 Component, Equipment, and System Commissioning Tests, and for Level 2 Intra-station system interface tests.

    b. Record and submit commissioning test demonstration data and issues.

    c. Correct issues and repeat commissioning test demonstration when results do not meet Acceptance Criteria.

10. Attend commissioning meetings as requested by the Testing and Commissioning Manager .

11. Report any inconsistencies or issues in system operations or performance.

12. Provide personnel to support commissioning test demonstration specified herein as requested by the Testing and Commissioning Manager .

13. In the event that a commissioning test demonstration fails, assist in determining the cause of failure. Make corrections as necessary.

14. Cooperate with Testing and Commissioning Manager to make equipment and systems ready for commissioning tests specified herein as early in the construction schedule as possible.

1.05 QUALITY ASSURANCE

A. Coordinate completion of Install Verification forms, by the Quality Control Inspector, as identified in the Contractors Quality Control Inspection and Test Plan.

PART 2 - PRODUCTS

2.01 TEST EQUIPMENT

A. Provide test equipment and instrumentation, including consumable supplies, required to execute commissioning activities. Unless noted otherwise, test equipment and instrumentation remain the property of the Contractor.

B. Provide proprietary test instruments or tools required by the equipment manufacturer. Provide and operate the proprietary test instruments or tools as required for commissioning work.

PART 3 - EXECUTION

3.01 LEVEL 1 COMMISSIONING ACTIVITIES REQUIREMENTS

A. Level 1 commissioning activities scope: Technical requirements for commissioning of Equipment are specified herein.

B. Provide technicians, instrumentation, and tools to perform commissioning activities in accordance with accepted commissioning activity procedures at the direction of the Testing and Commissioning Manager.

C. Scope of Equipment commissioning activities applies to all portions of the installation described in the test. Where sampling is specified, it applies only to the commissioning test demonstration.

D. Upon approval of product submittals associated with the Technical requirements and the scope of Commissioning develop and submit for approval Install Verification Checklist forms for the quality criteria of the Work specified herein.

E. Preparation:

1. Certify that Equipment, subsystems, and equipment have been completed, calibrated, and started; and are operating in accordance with Contract Documents.

2. Testing Instrumentation: Install measuring instruments and logging devices to record test data in accordance with accepted commissioning test procedures as directed by the Testing and Commissioning Manager.

3. Certify that Equipment instrumentation and control systems have been completed and calibrated; are operating according to the Contract Documents; and that pretest set points have been recorded.

F. Test all operating modes, interlocks, control responses to abnormal or emergency conditions, and verify proper response of building automation system controllers and sensors.

G. Perform tests using design conditions whenever possible. If tests cannot be completed because of a deficiency outside the scope of the Equipment system, document the deficiency and report it to Sound Transit. After deficiencies are resolved, reschedule tests.

H. Simulated conditions may need to be imposed using an artificial load when it is not practical to test under design conditions. Provide equipment to simulate loads. Set simulated conditions in accordance with accepted commissioning test procedures as directed by the Testing and Commissioning Manager. Document simulated conditions and methods of simulation. After tests, return settings to normal operating conditions.

I. Request approval to alter set points when simulating conditions is not practical. Request approval to alter sensor values with a signal generator when design or simulating conditions and altering set points are not practical.

J. Where seasonal testing is specified, complete appropriate initial commissioning tests and documentation within the Construction Period. Schedule and execute seasonal tests when specified conditions are expected.

3.02 LEVEL 1 AND LEVEL 2 COMMISSIONING ACTIVITY PROCEDURES

A. Submit Level 1 commissioning activity test procedures and data forms for the following types of commissioning activities, requirements for which are specified herein:

1. Level 1 commissioning activities:

a. Installation verification.

b. Static tests.

c. Start-up procedures.

d. Component tests.

e. Equipment tests.

f. System tests.

2. Level 2 commissioning activities:

a. Intra-station system interface tests.

3.03 LEVEL 1 INSTALLATION VERIFICATION REQUIREMENTS

A. Scope: Installation verification requirements as stated elsewhere in the Contract Documents apply to the following:

1. 2308-IV-01 - Vibration and seismic controls for HVAC piping and equipment.

2. 2308-IV-02 – Instrumentation and control for HVAC.

3. 2308-IV-03 - Refrigerant piping.

4. 2308-IV-04 – Metal ducts.

5. 2308-IV-05 - Air duct accessories.

6. 2308-IV-06 – HVAC fans.

7. 2308-IV-07 - Diffusers, registers and grilles.

8. 2308-IV-08 – Particulate air filtration.

9. 2308-IV-09 - HVAC Insulation.

10. 2308-IV-10 – Air Handling Units.

11. 2308-IV-11 – Split system Air conditioning or heat pump units.

12. [2308-IV-10 – Air-Cooled Chiller/Heat Pumps.]

13. [2308-IV-11 – Hydronic Circulation Pumps.]

14. 2308-IV-12 – Electric heaters.

15. 2308-IV-13 - Electric duct heaters.

B. Installation Verification Checklist is the responsibility of the installing contractor and is required to include the following, at a minimum:

1. Organized to prompt the installer to check off quality criteria for each discrete portion of the Work.

2. Identify the system or features to which the Installation Verification Checklist applies at the top of the form.

3. Section for verification of delivery of approved materials.

4. Section for condition of materials at delivery.

5. Section for description of installation steps. Include manufacturer's installation instructions.

6. Section for start-up. Include start-up instructions and start-up data forms. Use manufacturer's start-up data forms if available.

7. Space at the end of the form for the installer to print their name and company name, fill in the date, and sign or initial.

8. Space at the end of the form for the Quality Control inspector designated for the scope to review and accept installation verification. QC Inspector must perform Install Verification and verify each element identified in form has been reviewed for conformance with contract documents and in accordance with the Contractors Quality Control Inspection and Test Plan as part of Section 01 45 00 – Quality Assessment / Quality Control.

9. Space to identify the area of work for which the installer is executing the Installation Verification Checklist.

10. Description of the quality criteria as it pertains to the specific work. Include a check-box for each criterion.

11. Example checklists/test forms can be provided upon request.

C. Quality Criteria: Installation Verification Checklists shall address the following quality criteria:

1. Make and model match approved submittals.

2. Equipment is installed without visible damage.

3. Location is as indicated on drawings.

4. Equipment is accessible for maintenance using safe work practices.

5. There is sufficient space to remove and replace components intact without demolishing other work.

6. Equipment surfaces are clean and free of dust, dirt, oil and other contaminants.

7. Surfaces exposed to supply and return air flows are as clean as when they were manufactured.

8. Air filters fit tight to avoid air leakage around the filters. Special attention to tight closure of the space between the edges of slide-out filter frames and the access door.

9. Equipment is accessible for adjustment, maintenance, and testing, including replacement of components or the entire assembly.

10. Piping is properly supported and seismically braced.

11. Equipment is installed level or pitched per manufacturer's requirements.

12. Vibration isolation devices are adjusted static deflection and support the equipment level.

13. Before performing a Commissioning Test, installation verification checklists must be performed and completed by QC inspector designated for the appropriate area specified here in and within the Contractors Quality Control Inspection and Test Plan as part of Section 01 45 00 – Quality Assessment / Quality Control. Submit completed Installation Verification Checklists for work included in the Commissioning Test.

D. Fill out, sign, and submit the Installation Verification Checklists for HVAC weekly while the Work is being installed. The intent is to fill out and sign the Installation Verification Checklist as work proceeds to improve the quality of the installation.

3.04 LEVEL 1 COMMISSIONING TESTING REQUIREMENTS

A. Commissioning Testing Scope: Technical requirements for Commissioning Testing of HVAC are specified herein.

B. Provide technicians, instrumentation, and tools to perform Commissioning Tests in accordance with approved Commissioning Test Procedures at the direction of the Testing and Commissioning Manager.

C. Scope of HVAC Commissioning Tests applies to all portions of the HVAC installation described in the test, from central equipment for heat generation and refrigeration through distribution systems to each conditioned space. It shall include measuring capacities and effectiveness of operational and control functions. Where sampling is specified, it applies only to the Commissioning Test Demonstration.

D. Testing Preparation:

1. Certify that HVAC, subsystems, and equipment have been completed, calibrated, and started; are operating according to the Contract Documents.

2. Testing Instrumentation: Install measuring instruments and logging devices to record test data in accordance with approved Commissioning Test Procedures as directed by the Testing Commissioning Manager.

3. Certify that HVAC instrumentation and control systems have been completed and calibrated; are operating according to the Contract Documents; and that pretest set points have been recorded.

4. Set systems, subsystems, and equipment into operating mode to be tested (e.g., normal shut down, normal auto position, normal manual position, unoccupied cycle, emergency power, and alarm conditions) in accordance with approved Commissioning Test Procedures as directed by the Testing and Commissioning Manager.

E. Test all operating modes, interlocks, control responses, responses to abnormal or emergency conditions, and verify proper response of building automation system controllers and sensors.

F. Tests shall be performed using design conditions whenever possible.

G. Simulated conditions may need to be imposed using an artificial load when it is not practical to test under design conditions. Provide equipment to simulate loads. Set simulated conditions in accordance with approved Commissioning Test Procedures as directed by the Testing and Commissioning Manager. Document simulated conditions and methods of simulation. After tests, return settings to normal operating conditions.

H. Request approval to alter set points when simulating conditions is not practical.

I. Request approval to alter sensor values with a signal generator when design or simulating conditions and altering set points are not practical.

J. If tests cannot be completed because of a deficiency outside the scope of the HVAC system, document the deficiency and report it to Sound Transit. After deficiencies are resolved, reschedule tests.

K. Where seasonal testing is specified, complete appropriate initial performance tests and documentation within the Construction Period. Schedule and execute seasonal tests when specified conditions are expected.

3.05 LEVEL 1 COMMISSIONING TEST PROCEDURES

A. Submit Test Procedures and Data Forms for the following types of tests, requirements for which are specified herein:

1. Static Tests.

2. Start-up.

B. The Testing and Commissioning Manager will provide Test Procedures and Data Forms for the following types of tests, requirements for which are specified herein:

1. System and Equipment Testing.

3.06 LEVEL 1 STATIC TEST REQUIREMENTS

A. Static Test checklists are required to include the following, at a minimum:

1. 2308-ST-01: Duct and Duct Accessory Leakage:

a. System/Equipment to be tested:

1) Air handling ducts in accordance with metal ducts requirements as stated elsewhere in the Contract Documents.

b. Functions to be tested:

1) Ductwork and air handling unit casing leakage.

a) ST or Construction Management team must select each class of duct ± 10 percent of site ductwork to be tested. If does not pass leakage test, select additional percent.

b) AHU and ACU operate at 1-inch wg. or higher casing to be tested for leakage.

c) AHU and ACU operating at less than 1-inch wg., casing is not required to be tested for leakage.

d) ACU and FCU not connected to ductwork are not required to be tested for leakage.

c. Conditions of the test:

1) Include in Static Test Procedures and Data Forms submittal:

a) Instrumentation to be used must be able to measure airflow ±5 percent accuracy of the measure leakage airflow rate.

b) Leakage testing plan showing how ductwork will be divided if testing will be performed in sections.

c) Calculations showing the maximum allowable leakage for each unit and for each section of ductwork to be tested.

2) Test in accordance with SMACNA HVAC Air Duct Leakage Test Manual (1st Edition).

3) Seal off each system or section if applicable, securely blanking off inlets and discharges to the section.

4) Attach a formed collar in one of the blank-offs in the section to be tested.

5) Connect a leak test unit to the formed collar. Leak test unit shall include a pressurization fan and calibrated orifice to measure flow.

6) Positively pressurize ductwork and air handling unit casings to the pressures indicated below for each class of ductwork:

a) The test pressure shall be equal to the duct work construction pressure class (highest level if more than one pressure construction class applies to a particular test section).

b) The sealing class shall be as required by the Washington State Energy Code or Authority having Jurisdiction Energy Code.

c) The leakage class and total allowable leakage rate shall be based on the SMACNA dust leakage testing manual charts.

7) Record duct leakage as static pressure differential and corresponding flow rate in CFM using the orifice calibration chart.

8) Air handling units shall be tested to the same criteria as ductwork of the same pressure class.

d. Acceptable Results:

1) Leakage rates are not to exceed the values based on the pressure classifications stated to SMACNA Air Duct Leakage Test Manual, Figure 4.1 (2nd Edition).

2) The following formula shall be used to determine maximum allowable leakage rates per 100 square feet of duct:

$C_L = F/P^{0.65}$

Where:

CL = leakage class and is a constant

F = leakage rate cfm/100 square feet of duct surface

P = static pressure

3) The above criteria shall also apply if the system is tested in sections.

4) Leakage concentrated at one point may result in objectionable noise, even if the system meets the leakage criteria. Locate the point source(s) of noisy leakage and correct the offending condition.

2. [2308-ST-02: Hydronic piping leakage:]

a. [System/Equipment to be Tested:]

1) [Hydronic piping: Refer to the hydronic piping as stated elsewhere in the Contract Documents.]

b. [Functions to be Tested:]

1) [See “Test hydronic piping” as stated elsewhere in the Contract Documents.”]

c. [Conditions of the Test:]

1) [See “Test hydronic piping” as stated elsewhere in the Contract Documents.]

d. [Acceptable Results:]

1) [See “Test hydronic piping” as stated elsewhere in the Contract Documents.]

3. 2308-ST-02: Refrigerant piping leakage:

a. System to be tested:

1) All field installed refrigerant piping.

b. Conditions of the test:

1) Pressure test to 1 ½ times working pressure with compressed air.

2) Provide documentation verifying calibration of test equipment and final results.

3) Repeat procedure as needed until all leaks have been eliminated.

3.07 LEVEL 1 START-UP REQUIREMENTS

A. Start-up checklists are required to include the following, at a minimum:

1. 2308-SU-01: Air Handling Unit (AHU) Start-up:

a. System/Equipment to be tested:

1) Air handling (indoor) units in accordance with the requirements of split system heat pump units as stated elsewhere in the Contract Documents as scheduled.

b. Functions to be tested:

1) Start-up of air handling units.

c. Conditions of the test:

1) Complete 2308-ST-01: Duct and Duct Accessory Leakage with acceptable results before start-up.

2) Air handling units and ductwork shall be clean, and filters installed before start-up.

3) Verify installation and perform startup of units in accordance with manufacturer's written installation and startup procedures.

4) Verify installation and perform startup of units in accordance with startup service requirements for split system air-conditioning units and air-source unitary heat pumps as stated elsewhere in the Contract Documents.

5) Manufacturer-approved personnel shall start-up air handling units in accordance with manufacturer's written procedures. Record results on manufacturer's approved forms.

6) Verify and confirm power supply requirements and motor control equipment under Division 26 Commissioning specification.

d. Acceptable Results:

1) Documented acceptable installation and startup in accordance with manufacturer's requirements.

2. 2308-SU-02: Air Conditioning Unit (ACU) and Compressor Unit (CU) Start-Up

a. System/equipment to be tested:

1) Air conditioning and compressor units in accordance with the requirements of computer room air conditioners and condensers, and split system heat pump units as scheduled.

b. Functions to be tested:

1) Start-up of air conditioning and compressor units.

c. Conditions of the test:

1) Complete 2308-ST-01: Duct and Duct Accessory Leakage with acceptable results before start-up.

2) Air conditioning and compressor units and ductwork shall be clean, and filters installed before start-up.

3) Verify installation and perform startup of units in accordance with manufacturer's written installation and startup procedures.

4) Verify installation and perform startup of units in accordance with startup service requirements for computer room air conditioners and condensers, split system air-conditioning units, rooftop heat pump units and air-sourced unitary heat pump as stated elsewhere in the Contract Documents.

5) Manufacturer-approved personnel shall start-up air handling units in accordance with manufacturer's written procedures. Record results on manufacturer's approved forms.

6) Verify and confirm power supply requirements and motor control equipment under Division 26 Commissioning specification.

d. Acceptable Results:

1) Documented acceptable installation and startup in accordance with manufacturer's requirements.

3. [2308-SU-03: Air-Cooled Chiller/Heat Pumps:]

a. [System/Equipment to be Tested:]

1) [Air-Cooled Chiller/Heat Pumps in accordance with the requirements of Air-Cooled Chiller/Heat Pumps as stated elsewhere in the Contract Documents as scheduled.]

b. [Functions to be Tested:]

1) [Start-up of Air-Cooled Chiller/Heat Pumps.]

c. [Conditions of the Test:]

1) [Verify installation and perform startup of units in accordance with manufacturer's written installation and startup procedures.]

2) [Verify installation and perform startup of units in accordance with startup service requirements for Air-Cooled Chiller/Heat Pumps as stated elsewhere in the Contract Documents.]

3) [Manufacturer-approved personnel shall start-up Air-Cooled Chiller Heat Pumps in accordance with manufacturer's written procedures. Record results on manufacturer's approved forms.]

4) [Verify and confirm power supply requirements and motor control equipment under Division 26 Commissioning specification.]

d. [Acceptable Results:]

1) [Documented acceptable installation and startup in accordance with manufacturer’s requirements.]

4. [2308-SU-04: Hydronic Circulation Pumps:]

a. [System/Equipment to be Tested:]

1) [Hydronic Circulation Pumps in accordance with the requirements of Circulation Pumps as stated elsewhere in the Contract Documents as scheduled.]

b. [Functions to be Tested:]

1) [Start-up of Hydronic Circulation Pumps.]

c. [Conditions of the Test:]

1) [Verify installation and perform startup of units in accordance with manufacturer’s written installation and startup procedures.[

2) [Verify installation and perform startup of units in accordance with startup service requirements for Air-Cooled Chiller/Heat Pumps as stated elsewhere in the Contract Documents.]

3) [Manufacturer-approved personnel shall start-up Hydronic Circulation Pumps in accordance with manufacturer’s written procedures. Record results on manufacturer’s approved forms.]

4) [Verify and confirm power supply requirements and motor control equipment under Division 26 Commissioning specification.]

d. [Acceptable Results:]

1) [Documented acceptable installation and startup in accordance with manufacturer’s requirements.]

5. 2308-SU-03: Fan Start-Up:

a. System/equipment to be tested:

1) Fans in accordance with HVAC fans requirements as stated elsewhere in the Contract Documents as scheduled.

b. Functions to bet:

1) Start-up of fans.

c. Conditions of the test:

1) Complete 2308-ST-01: Duct and Duct Accessory Leakage with acceptable results before start-up.

2) Exhaust fans and ductwork shall be clean, and filters installed before start-up.

3) Verify installation and perform startup of units in accordance with manufacturer’s written installation and startup procedures.

4) Verify installation and perform startup of units in accordance with startup service requirements of HVAC fans as stated elsewhere in the Contract Documents.

5) Manufacturer-approved personnel shall start-up air handling units in accordance with manufacturer's written procedures. Record results on manufacturer's approved forms.

6) Verify and confirm power supply requirements and motor control equipment under Division 26 Commissioning specification.

d. Acceptable Results:

1) Documented acceptable installation and startup in accordance with manufacturer's requirements.

3.08 LEVEL 1 COMPONENT TESTING REQUIREMENTS

A. Component Testing checklists are required to include the following, at a minimum:

1. 2308-C-01: Backdraft Dampers:

a. System/Equipment to be tested:

1) Backdraft dampers in accordance with the requirements of air duct accessories as stated elsewhere in the Contract Documents.

b. Functions to be tested:

1) Tight closure against backdraft.

2) Low resistance to forward flow.

c. Conditions of the test: Systems in which backdraft dampers are installed shall operate at their normal flow rates, pressures, and temperatures during the test. During test continuously monitor static pressure difference between locations immediately upstream and downstream of damper.

1) Start the fan connected to the duct in which the damper is mounted. Observe damper operation.

2) Stop the fan. Observe damper operation.

3) Create a backdraft at the damper location. Observe damper operation.

d. Acceptable Results:

1) When the fan runs, the damper begins to open at less than 0.02 inches water gauge pressure drop. The damper opens completely with less than 0.2 inches water gauge pressure drop.

2) With the fan off, the damper closes completely.

3) The damper remains closed under backdraft conditions.

2. 2308-C-02: Fire Dampers:

a. System/Equipment to be tested:

1) Fire dampers in accordance with the requirements of air duct accessories as stated elsewhere in the Contract Documents.

b. Functions to be tested:

1) Fire damper accessibility.

2) Fire damper operation.

c. Conditions of the test: Systems in which dampers are installed shall operate at their normal flow rates and temperatures during the test.

1) With fan system operating in normal mode, remove the fusible link from fire dampers, allowing them to close unassisted. When satisfactory operation has been verified, reopen dampers and reinstall the fusible links.

d. Acceptable Results:

1) Dampers close tight immediately upon release of the fusible link, without intervention or assistance. Dampers and fusible links are accessible.

3. 2308-C-03: Combination Fire/Smoke Dampers:

a. System/Equipment to be tested:

1) Combination fire and smoke dampers in accordance with the requirements of air duct accessories as stated elsewhere in the Contract Documents.

b. Functions to be tested:

1) Combination fire and smoke damper accessibility.

2) Combination fire and smoke damper operation.

3) For commandable combination fire/smoke dampers perform the following testing.

a) Time taken for damper blades to close.

b) Damper blades close upon loss of AC power.

c. Conditions of the test: Systems in which combination fire and smoke dampers are installed shall operate at their normal flow rates and temperatures during the test.

1) With fan system operating in normal mode, expose duct smoke detectors to smoke.

2) Clear the smoke and reset the smoke detectors.

[Designer: For room protected by clean agent, FSD must be closed by room clean agent control panel in accordance with NFPA 2001.]

3) Actuate the heat link on combination fire and smoke dampers, allowing them to close unassisted. When satisfactory operation has been verified, reopen dampers and reset the heat links.

a) Prior to executing conditions listed below for the combination fire/smoke dampers, disconnect control signal. Observe the position of the damper and of the controlled device.

b) Prior to executing conditions listed below for the combination fire/smoke dampers disconnect power. Observe the position of the actuator and of the controlled device.

c) During tests listed below for the combination fire/smoke dampers, actuator shall be connected to the output terminal of the controller as required for final, permanent installation. If for any reason, the connection of the actuator to the controller is opened prior to Functional Completion, this test shall be repeated.

d) Initiate commands from supervisory logic controller.

e) Command fire/smoke damper full open; observe response of actuator; directly observe position of damper blade(s) and the position of the damper shaft end marking.

f) Command damper full closed; observe response of actuator; directly observe position of damper blade(s).

d. Acceptable Results:

1) Upon loss of control signal or control power, actuator drives combination fire/smoke dampers close.

2) When commanded open, the actuator fully opens the damper; all damper blades and damper sections; damper shaft end marking corresponds with damper position.

3) When commanded closed, the actuator fully closes the damper; damper blades are observed to be fully closed.

4) Dampers close tight upon activation in accordance to UL555S.

5) Dampers open fully upon activation in accordance UL 555S.

6) Dampers close tight immediately upon actuation of the heat link, without intervention or assistance.

4. 2308-C-04: Motorized Dampers (MDPR):

a. System/equipment to be tested:

1) Motorized Dampers (per plans), actuators and associated controls in accordance with the requirements of instrumentation and control for HVAC as stated elsewhere in the Contract Documents as scheduled.

b. Functions to be tested:

1) Damper operation.

2) Time taken for dampers to actuate.

3) Damper accessibility.

4) Performance of actuator in the absence of control signal.

5) Normal position of actuator in the absence of control power.

6) Actuator response to control signals.

7) Damper modulation, for modulating dampers

c. Conditions of the test:

1) Prior to executing conditions listed below for this equipment, disconnect control signal. Observe the position of the actuator and of the controlled device.

2) Prior to executing conditions listed below for this equipment, disconnect power. Observe the position of the actuator and of the controlled device.

3) During tests listed below for this equipment, actuator shall be connected to the output terminal of the controller as required for final, permanent installation. If for any reason, the connection of the actuator to the controller is opened prior to Functional Completion, this test shall be repeated.

4) Initiate commands from the operator's terminal or supervisory logic controller.

5) Controlled fluids shall be flowing at or near design temperature, velocity and pressure.

6) Command damper full open; observe response of actuator; directly observe position of damper blade(s) and the position of the damper shaft end marking.

7) Command damper full closed; observe response of actuator; directly observe position of damper blade(s) or measure and record flow in circuit controlled by damper.

8) For modulating damper, command damper to 20 percent open; observe damper response.

9) For modulating damper, command damper to 60 percent open; observe damper response.

d. Acceptance Criteria:

1) Upon loss of control signal or control power, actuator drives controlled device to specified position.

2) When commanded open, the actuator fully opens the damper; all damper blades and damper sections; damper shaft end marking corresponds with damper position.

3) When commanded closed, the actuator fully closes the damper; damper blades are observed to be fully closed, or flow volume is observed to be zero.

4) Dampers close tight upon activation within 10 seconds.

5) Dampers open fully upon activation within 10 seconds.

6) When commanded 20 percent open, the actuator opens the damper approximately 20 percent.

7) When commanded 60 percent open, the actuator opens the damper approximately 60 percent.

5. 2308-C-05: Temperature Sensors and Transmitters:

a. System/equipment to be tested:

1) RTD and thermistor temperature sensors and transmitters in accordance with the requirements of instrumentation and control for HVAC as stated elsewhere in the Contract Documents.

b. Functions to be tested:

1) Accuracy of calibration.

c. Conditions of the test:

1) Compare temperature indication at Operator Workstation with calibration-grade instrument temperature when subjected to the same steady-state conditions at the following temperatures.

a) At or near the high limit of the normal operating range to which the sensor will be subjected. Bench test is acceptable.

b) At or near the low limit of the normal operating range to which the sensor will be subjected. Bench test is acceptable.

c) With the sensor installed in its final, permanent position, compare the temperatures indicated by the sensor and the calibrator at midrange of the normal operating condition.

2) Exception: For room temperature sensors, compare at room temperature not greater than 70 degrees Fahrenheit. Demonstrate a random sample of 15 percent of room temperature sensors.

d. Acceptance Criteria:

1) For conditions 1) and 2), temperature indication at Operator Workstation shall be within plus/minus 0.5 degree Fahrenheit of the calibration-grade instrument temperature. For condition 3), temperature indication at Operator Workstation shall be within plus/minus 1.0 degrees Fahrenheit of the calibration-grade instrument temperature.

2) Room temperature sensor temperature indication at Operator Workstation shall be within plus/minus 0.5 degrees Fahrenheit of the calibration-grade instrument temperature. If the Contractor fails to demonstrate acceptable results for all sample sensors, the sample will be rejected and the Contractor shall, after making corrections, demonstrate a repeat sample of double the number

of sensors in the failed sample, at no additional cost to Sound Transit.

6. 2308-C-06: Pressure Transmitters/Transducers:

   a. System/equipment to be tested:

      1) Pressure transmitters/transducers used for air static pressure, water pressure, water differential pressure, and status sensors in accordance with the requirements of instrumentation and control for HVAC as stated elsewhere in the Contract Documents.

      [Designer: Follow manufacturer instructions when air filter pressure sensors are supplied with the units.]

   b. Functions to be tested:

      1) Accuracy of calibration.

   c. Conditions of the test: All systems, equipment, and components shall be complete and functional at the time of this test:

      1) Compare temperature indication at Operator Workstation with calibration-grade instrument pressure when subjected to the same steady-state conditions at the following pressures:

         a) At or near the high limit of the normal operating range to which the sensor will be subjected. Bench test is acceptable.

         b) At or near the low limit of the operating range to which the sensor will be subjected. Bench test is acceptable.

         c) With the sensor installed in its final, permanent position, compare the pressures indicated by the sensor and the calibrator at midrange of the normal operating condition.

   d. Acceptance Criteria:

      1) At all conditions, error is less than plus or minus 1.2 percent of full scale.

7. 2308-C-07: Status Sensors:

   a. System/equipment to be tested:

      1) Status sensors in accordance with the requirements of instrumentation and control for HVAC as stated elsewhere in the Contract Documents.

   b. Functions to be tested:

      1) Accuracy of change of status indication.

   c. Conditions of the test: All systems, equipment, and components shall be complete and functional at the time of this test:

      1) Execute this test after completion of testing, adjusting, and balancing for the associated fan.

2) For fans:

a) Operate fan at lowest design flow as balanced. Adjust sensor to indicate fan running at a differential pressure approximately 10 percent below differential pressure at low design flow as balanced.

b) Shut down fan.

c) Restart fan.

d. Acceptance Criteria:

1) For Fans:

a) Operator Workstation indicates fan is running.

b) Operator Workstation indicates fan is stopped.

c) Operator Workstation indicates fan is running.

8. 2308-C-08: Heaters and Duct Heaters:

a. Equipment to be tested:

1) Wall mounted room heaters and ductwork mounted heaters.

b. Functions to be tested:

1) Enabling and disabling of heaters based on internal thermostats or duct mounted thermostats.

2) Change in air temperature during operation (Duct Heaters only).

3.09 LEVEL 1 EQUIPMENT TESTING REQUIREMENTS

A. Equipment checklists are required to include the following, at a minimum:

1. 2308-E-01: Air Handling Unit Control (AHU):

a. Equipment to be tested:

1) Air handling (indoor) units in accordance as scheduled elsewhere in the Contract Documents:

b. Functions to be tested:

c. Starting and stopping by local control Acceptance Criteria:

1) All functions and communications indicated in the sequence of operation operate correctly. Refer to the control diagrams on Mechanical -HVAC Contract Drawings for sequences of operation. Drawing numbers vary for stations and facilities.

2) All integral manufacturer’s controls shall operate correctly per the manufacturer’s sequence of operation and safety responses.

2. 2308-E-02: Fan Control:

a. System/equipment to be tested:

1) Fans in accordance with HVAC fans as stated elsewhere in the Contract Documents as scheduled.

b. Functions to be tested:

1) Starting and stopping by local control.

c. Acceptance Criteria:

1) All functions and communications indicated in the sequence of operation operate correctly. Refer to the control diagrams on Mechanical -HVAC Contract Drawings for sequences of operation. Drawing numbers vary for stations.

3. 2308-E-03: Air Conditioning Unit (ACU) and Compressor Unit (CU) Control:

a. System/equipment to be tested:

1) Air conditioning and compressor units in accordance with split-system heat pump units as stated elsewhere in the Contract Documents and as scheduled.

b. Functions to be tested:

1) Starting and stopping by local control.

c. Acceptance Criteria:

1) All functions and communications indicated in the sequence of operation operate correctly. Refer to the control diagrams on Mechanical -HVAC Contract Drawings for sequences of operation. Drawing numbers vary for stations and facilities.

d. All integral manufacturer's controls shall operate correctly per the manufacturer's sequence of operation and safety responses.

4. 2308-E-04: Electric Heaters Control:

a. System/equipment to be tested:

1) Electric Heaters in accordance with electric heaters requirements as stated elsewhere in the Contract Documents.

b. Functions to be tested:

1) Starting and stopping by local control.

c. Conditions of the test:

1) Refer to plan sheets for sequence of operations.

d. Acceptance Criteria: All functions and communications indicated in the sequence of operation operate correctly.

3.10 LEVEL 1 SYSTEM TESTING REQUIREMENTS

A. Systems checklists are required to include the following, at a minimum:

1. 2308-S-01: Air moving Systems Sequences of Operation:

a. Systems to be tested:

1) All air moving systems and associated equipment listed in the Equipment Testing Requirements.

b. Systems functions to be tested:

1) Sequence of Control including all integral manufacturer's controls (controls that are provided as part of the equipment).

c. Conditions of the test:

1) Refer to the control diagrams on Mechanical -HVAC Contract Drawings for sequences of operation. Drawing numbers vary for stations, garages, and facilities.

d. Acceptance Criteria:

1) All functions and communications indicated in the sequence of operation operate correctly.

2. [2308-S-02 Hydronic Systems Sequence of Operation:]

a. [Systems to be tested:]

1) [All hydronic circulation systems and associated equipment listed in the Equipment Testing Requirements.]

b. [Systems functions to be tested:]

1) [Sequence of Control including all integral manufacturer's controls (controls that are provided as part of the equipment).]

c. [Conditions of the test:]

1) [Refer to the control diagrams on Mechanical -HVAC Contract Drawings for sequences of operation. Drawing numbers vary for stations, garages, and facilities.]

d. [Acceptance Criteria:]

1) All functions and communications indicated in the sequence of operation operate correctly.]

3. 2308-S-03: Verification of Testing, Adjusting, and Balancing for HVAC:

a. System/equipment to be tested:

1) Equipment and systems included in the testing, adjusting, and balancing for HVAC as stated elsewhere in the Contract Documents.

b. Functions to be tested:

1) Verification of final report of testing, adjusting, and balancing (TAB) data and measured TAB data.

c. Conditions of the test:

1) Commissioning Test Demonstration: Present a copy of final TAB report. The final TAB report consists of final TAB field data forms, after systems have been balanced within the tolerances of testing,

adjusting, and balancing for HVAC as stated elsewhere in the Contract Documents, but before they are “cleaned up” for submittal as the final TAB report.

2) Commissioning Test Demonstration: Repeat readings in the presence of Sound Transit’s Witness of a sample of 10 percent of the data recorded in the pre-final TAB report.

3) Commissioning Garage Ventilation: Garage supply and exhaust fans shall be balanced to match performance at a given level during air balancing.

4) Commissioning Test Demonstration: Sound Transit’s Witness will select the sample at the time of the test.

d. Acceptance Criteria:

1) Commissioning Test Demonstration: Not more than 20 percent of the sampled readings shall deviate by more than 10 percent from the recorded readings in the pre-final TAB report.

2) Commissioning Test Demonstration: No sample readings shall deviate by more than 15 percent from the recorded readings in the pre-final TAB report.

3) Commissioning Test Demonstration: If the pre-final TAB report is rejected for excessive deviation between readings and reported conditions, make corrections to the system balance at no additional cost to Sound Transit. When corrections are complete, notify the A/E in writing that the system is ready for revalidation. Reimburse Sound Transit for direct expenses incurred as the result of repeating the validation process.

3.11 LEVEL 2 INTRA-STATION SYSTEM INTERFACE TESTING REQUIREMENTS

A. 2308-IS-01: Air Handling Unit (AHU) and Dampers Control Interface with BMS and Fire Alarm System (FA):

1. System/equipment to be tested:

B. Air handling indoor or outdoor units in accordance as scheduled elsewhere in the Contract Documents:

C. Combination fire and smoke dampers (FSD) in accordance with the requirements of air duct accessories as stated elsewhere in the Contract Documents.

D. Motorized Dampers (MDPR) in accordance with the requirements of instrumentation and control for HVAC as stated elsewhere in the Contract Documents as scheduled.

1. System Function to be tested:

a. Normal Operation: AHU start and stop by local control and open/close MDPR/FSD remotely by BMS.

1) FA Shutdown Operation:

2) AHU Fans and Supply/Exhaust Fans (SFAN/EFAN) shutdown by duct smoke detector and FA closed FSD/MDPR serving the protected area.

[Notes to EOR: For Space Protected by Clean Agent: AHU Fans and SFAN/EFAN shutdown and close MDPR by BMS and FA closed FSD serving the protected area.]

3) Operation under emergency power, where applicable.

2. Acceptance Criteria:

a. All functions and communications indicated in the sequence of operation operate correctly. Refer to the control diagrams on Mechanical -HVAC Contract Drawings for sequences of operation. Drawing numbers vary for stations and facilities.

b. All integral manufacturer's controls shall operate correctly per the manufacturer's sequence of operation and safety responses.

c. AHU Fans and SFAN/EFAN start and stop in accordance with BMS command or stop by smoke detector or FA. FSD/MDPR open/close in accordance with BMS command or smoke detector or FA.

d. FSD: FA and LOS report the alarm. Combination fire and smoke dampers close. Supply (and return) fan(s) stop. After the appropriate time delay, outside (and return) air dampers close.

e. For equipment provided with emergency electrical power service, the BMS and fan equipment automatically restart after power is transferred to an emergency power source without nuisance alarms or the need for operator intervention. When normal power is restored and power is transferred back to the normal power source, the BMS and fan equipment continue to operate without nuisance alarms or the need for operator intervention.

E. 2308-IS-02: Air Conditioning Unit (ACU) and Compressor Unit (CU) Control Interface with BMS and FA:

1. System/equipment to be tested:

a. Air conditioning and compressor units in accordance with split-system heat pump units as stated elsewhere in the Contract Documents and as scheduled.

b. Combination fire and smoke dampers (FSD) in accordance with the requirements of air duct accessories as stated elsewhere in the Contract Documents.

c. Motorized Dampers in accordance with the requirements of instrumentation and control for HVAC as stated elsewhere in the Contract Documents as scheduled.

2. System Function to be tested:

a. Normal Operation: ACU/CU start/stop and dampers open/close by local control and remotely by BMS.

3. FA Shutdown Operation:

a. ACU Fans and Supply/Exhaust Fans (SFAN/EFAN) shutdown by duct smoke detector and FA closed FSD serving the protected area.

[Notes to EOR: For Space Protected by Clean Agent: ACU Fans and SFAN/EFAN shutdown by BMS and FA closed FSD serving the protected area.]

4. Operation under emergency power, where applicable.

   a. Acceptance Criteria

      1) All functions and communications indicated in the sequence of operation operate correctly. Refer to the control diagrams on Mechanical -HVAC Contract Drawings for sequences of operation. Drawing numbers vary for stations and facilities.

      2) All integral manufacturer’s controls shall operate correctly per the manufacturer’s sequence of operation and safety responses.

      3) ACU Fans and SFAN/EFAN start and stop in accordance to BMS command or stop by smoke detector or FA. FSD/MDPR open/close in accordance to BMS command or smoke detector or FA.

      4) For equipment provided with emergency electrical power service, the BMS and fan equipment automatically restart after power is transferred to an emergency power source without nuisance alarms or the need for operator intervention. When normal power is restored and power is transferred back to the normal power source, the BMS and fan equipment continue to operate without nuisance alarms or the need for operator intervention.

F. 2308-IS-03: Supply Fan (SFAN) and Exhaust Fan (EFAN) Control Interface with BMS and Fire Alarm

1. System/equipment to be tested:

   a. Fans in accordance with HVAC fans as stated elsewhere in the Contract Documents as scheduled.

2. System Function to be tested:

   a. Starting and stopping remotely by BMS or Fire Alarm Control Panel (FACP) when smoke detector(s) is install in return air duct serving by this fan.

   b. Operating under emergency power, where applicable.

3. Acceptance Criteria:

   a. All functions and communications indicated in the sequence of operation operate correctly. Refer to the control diagrams on Mechanical -HVAC Contract Drawings for sequences of operation. Drawing numbers vary for stations and facilities.

   b. Fan start and stop in accordance with BMS command or stop by smoke detector/FACP.

   c. For fan provided with emergency electrical power service, the BMS and fan equipment automatically restart after power is transferred to an emergency power source without nuisance alarms or the need for operator intervention. When normal power is restored and power is transferred back to the normal power source, the BMS and fan continue to operate without nuisance alarms or the need for operator intervention.

G. 2308-IS-04: Electric Heaters Control

1. System/equipment to be tested:

   a. Electric Heaters in accordance with electric heaters requirements as stated elsewhere in the Contract Documents.

2. System Function to be tested:

   a. Starting and stopping remotely by BMS.

   b. Operation under emergency power, where applicable.

3. Conditions of the test:

   a. All functions and communications indicated in the sequence of operation operate correctly. Refer to the control diagrams on Mechanical -HVAC Contract Drawings for sequences of operation. Drawing numbers vary for stations and facilities.

4. Acceptance Criteria:

   a. All functions and communications indicated in the sequence of operation operate correctly. For equipment provided with emergency electrical power service, the BMS and fan equipment automatically restart after power is transferred to an emergency power source without nuisance alarms or the need for operator intervention. When normal power is restored and power is transferred back to the normal power source, the BMS and fan equipment continue to operate without nuisance alarms or the need for operator intervention.

H. 2308 IS-05: Hydronic Systems Control Interface with BMS:

1. System/equipment to be tested:

   a. Hydronic systems equipment to operate as stated elsewhere in the Contract Documents and as scheduled.

2. System Function to be tested:

   a. Hydronic systems equipment start/stop by local control and remotely by BMS.

   b. Operating under emergency power, where applicable.

3. Acceptance Criteria:

   a. All functions and communications indicated in the sequence of operation operate correctly. Refer to the control diagrams on Mechanical -HVAC Contract Drawings for sequences of operation. Drawing numbers vary for stations, and facilities.

   b. All integral manufacturer’s controls shall operate correctly per the manufacturer’s sequence of operation and safety responses.

   c. Hydronic equipment starts and stops in accordance to BMS command.

   d. For equipment provided with emergency electrical power service, the BMS and hydronic equipment automatically restart after power is transferred to an emergency power source without nuisance alarms or the need for operator intervention. When normal power is restored and power is transferred back to the normal power source, the BMS and continue to operate without nuisance alarms or the need for operator intervention.

INSTALLATION VERIFICATION CHECKLIST – GENERAL

No.	Checklist Item	Notes	Pass?		Date
			Yes	No	
1.1	Conditions of materials at time of delivery is acceptable:		☐	☐	
1.2	The make and model of the materials and/or equipment matches the product submittals:		☐	☐	
1.3	The installed materials and/or equipment does not have visible damage, including finishes:		☐	☐	

INSTALLATION VERIFICATION CHECKLIST – GENERAL

No.	Checklist Item	Notes	Pass? Yes	Pass? No	Date
1.4	The equipment and/or distribution materials matches the locations shown on the design drawings:		☐	☐	
1.5	The equipment and/or distribution materials matches the locations shown on the as-built drawings:		☐	☐	
1.6	The manufacturer’s recommended and required maintenance clearances are maintained:		☐	☐	

Notes:

(1)

INSTALLATION VERIFICATION CHECKLIST – IN-LINE FANS

No.	Checklist Item	Notes	Pass? Yes	Pass? No	Date
	MANUFACTURER’S INSTALLATION INSTRUCTIONS				
1.1	Verify that the installation follows all directions and recommendations per the attached manufacturer’s installation directions:		☐	☐	

Notes:

(1)

No.	Checklist Item	Notes	Pass? Yes	Pass? No	Date
	HVAC IN-LINE FANS				
2.1	The equipment is installed level and plumb.		☐	☐	
2.2	Isolation hangers are adjusted to level the unit as well as adjusted for proper seismic snubber gap (1/4”) and to prevent the rod hanger from short circuiting (by contacting the rod to the spring hanger housing)		☐	☐	
2.3	The motor is readily accessible for maintenance and inspection.		☐	☐	
2.4	The fan is supported independently from appropriate building structure.		☐	☐	

INSTALLATION VERIFICATION CHECKLIST – IN-LINE FANS

No.	Checklist Item	Notes	Pass? Yes	Pass? No	Date
2.5	Seismic bracing is installed and verified to be correct.		☐	☐	
2.6	Electrical clearances at motor connections are per NEC (36” clear minimum)		☐	☐	
2.7	Access doors are provided in the ductwork per specification.		☐	☐	
2.8	The unit permanent ID tag is installed securely.		☐	☐	
2.9			☐	☐	
2.10			☐	☐

END OF EXHIBITS

SECTION 23 41 00

PARTICULATE AIR FILTRATION

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for factory-fabricated air-filter devices and media used to remove particulate matter from air for HVAC applications.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents.

1. Air-Conditioning and Refrigeration Institute (ARI):

a. ARI 850 Performance Rating of Commercial and Industrial Air Filter Equipment.

2. American Society of Heating, Refrigeration, and Air Conditioning Engineers (ASHRAE):

a. ASHRAE 52.1 Gravimetric and Dust-Spot Procedures for Testing Air-Cleaning Devices Used in General Ventilation for Removing Particulate Matter.

b. ASHRAE 52.2 Method of Testing General Ventilation Air-Cleaning Devices for Removal Efficiency by Particle Size.

3. International Code Council:

a. Current International Mechanical Code with state and local amendments.

4. National Fire Protection Association (NFPA):

a. NFPA 70 National Electric Code.

b. NFPA 90A Standard for the Installation of Air Conditioning and Ventilating Systems.

c. NFPA 90B Standard for the Installation of Warm Air Heating and Air-Conditioning Systems.

1.03 SUBMITTALS

A. Submit the following:

1. Shop Drawings: Include plans, elevations, sections, and details to illustrate component assemblies and attachments.

a. Show filter rack assembly, dimensions, materials, and methods of assembly of components.

B. Include setting drawings, templates, and requirements for installing anchor bolts and anchorages. Transmit the following:

1. Product Data: Include dimensions; required clearances and access; rated flow capacity, including initial and final pressure drop at rated airflow; efficiency and test method; fire classification; furnished specialties; and accessories for each unit indicated.

2. Operation and maintenance data.

1.04 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by an Independent Testing Laboratory acceptable to authorities having jurisdiction and marked for intended use.

B. Comply with ARI 850.

C. Comply with ASHRAE 52.1 and ASHRAE 52.2 for method of testing and rating air-filter units.

D. Comply with NFPA 90A and NFPA 90B.

E. Regulatory Requirements: Comply with all applicable City, County, and State Codes and ordinances. In case of conflict with drawings or specifications, the codes and ordinances govern.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. AAF International.

2. Air Filter International.

3. Airguard Industries, Inc.

4. Barnebey & Sutcliffe Corp.

5. Columbus Industries, Inc.

6. CRS Industries, Inc.; CosaTron Div.

7. D Mark Inc.

8. Farr Co.

9. Flame Gard, Inc.

10. Flanders/CSC Corp.

11. Flanders Filters, Inc.

12. General Filters Inc.

13. International Air Filtration Corporation Koch Filter Corporation.

14. LakeAir International, Inc.

15. NiCon Filter Corp.; Continental Air Filter Div.

16. Purafil, Inc.

17. Research Products Corp.

B. Air Filtration:

1. Supply air units shall be provided with replaceable media filters arranged in banks as appropriate with holding frames. Air filter media shall be rated UL Class I. Filters shall be 30 percent MERV 7 unless scheduled otherwise.

2. Filter shall not be less than MERV 4 for ductless mini-split systems.

3. Where shown on plans, use MERV 7 prefilters upstream of MERV 13 final filters. Frame shall be galvanized steel with filter sealing gasket and fasteners. Fans shall be sized for design airflow with filters as scheduled.

4. Air handling units with outside air intake or dedicated outside air units shall be provided with a filter box capable of housing a filter with minimum of MERV 13 as indicated on drawings or as required by the AHJ. Units that condition and recirculate room air do not require MERV 13 filter box.

5. A high pressure drop alarm shall be transmitted to the Building Management System for ducted systems, where noted on the control diagrams.

C. Filter Box:

1. Provide in-line galvanized steel filter box with minimum 4” filter slot as scheduled on drawings. Filter box shall include snap clips and access door for removal of filter. Famco or equal. Provide with filter sizes as scheduled.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Position each filter unit with clearance for normal service and maintenance. Anchor filter holding frames to substrate.

B. Install temporary filters during construction period. Replace with permanent filters at Substantial Completion.

C. Install filters in position to prevent passage of unfiltered air.

D. Install filter-boxes to be in-line in the ductwork upstream of protected equipment. Provide required flanges and accessories to attach to upstream and downstream ducts.

E. Coordinate filter installations with duct and HVAC unit installations.

3.02 COMMISSIONING

A. Commissioning particulate air filtration as required elsewhere in the Contract Documents.

END OF SECTION

SECTION 25 08 50

COMMISSIONING OF FACILITY CONTROLS

NOTE TO DESIGNER:

SECTIONS WITH BRACKETS. E.G., [TEXT] ARE TO BE MODIFIED OR DELETED IF NOT APPLICABLE. ITALICIZED TEXT PROVIDES INSTRUCTION TO THE DESIGNER TO INCLUDE LANGUAGE ON SPECIFIC TOPICS WHEN APPLICABLE. THE INSTRUCTIONS ARE TO BE DELETED WHEN THE SPECIFICATION IS FINALIZED. LANGUAGE NOT IN BRACKETS IS TO BE USED AS IS WITHOUT MODIFICATION OR WITH AN APPROVED SPECIFICATION MODIFICATION REQUEST.

DESIGNER TO DELETE TEXT ABOVE FOR FINAL SECTION

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Requirements for the commissioning process for Facility and Garage Building Management System (BMS):

a. Level 1 commissioning activities for BMS.

b. Level 2 commissioning activities for interface verification between systems within this Contract.

c. Support for Level 3 commissioning activities for interface verification between systems provided under this Contract with systems provided by others.

d. Support for Level 4 commissioning activities related to pre-revenue testing.

B. Any LEED execution requirements for commissioning of BMS are in accordance with the LEED certification requirements (including the LEED specifications matrix requirements) as stated in the Contract Documents.

1. Integration of submeters into central Energy and Power Monitoring System (EPMS) is an activity which will require coordination with Division 22 and Division 26 Work.

C. Definitions:

1. See general commissioning definitions as stated in Contract Documents or Reference Documents.

2. Command: When used in relation to BMS commissioning activity, command refers to an instruction or signal sent from a human machine interface (HMI) for the BMS to control systems or specific equipment.

3. Human Machine Interface (HMI): The user interface comprised of equipment, software, and functional programming shown on the Plans and as specified in requirements for building management system – garage, as stated in the Contract Documents.

4. Systems, Equipment, and Components: Where these terms are used together or separately, they shall mean "as-built" systems, equipment, and components.

1.02 COORDINATION

A. See general commissioning requirements as stated in the Contract Documents for general coordination requirements related to commissioning.

1.03 COMMISSIONING ACTIVITIES

A. Commissioning work furnishes labor and material to accomplish BMS commissioning as specified in general commissioning requirements, as stated in the Contract Documents and herein, including:

1. Provide to the Testing and Commissioning Manager preliminary O&M information for use in developing commissioning test procedures.

2. Assist the Testing and Commissioning Manager in developing commissioning activity procedures and data forms submittals for work specified in this Section.

3. Provide information to the Testing and Commissioning Manager needed for control interface wiring diagrams submittals for the work of this Section.

4. Perform Level 1 and Level 2 commissioning activities specified in this Section, including installation verification, static tests, start-up, component tests, equipment tests, systems tests, and intrastation system interface tests.

5. Provide support for Level 3 commissioning activities:

a. Provide field testing points in the interface terminal cabinets (ITCs) and communications distribution cabinets (DCs), being present during Level 3 testing with adequate labor and support personnel to adjust equipment and troubleshoot system failures that might arise. When material or equipment provided in this contract is found to be in conflict with specified criteria, adjust or replace said material or equipment, with the assistance of manufacturer as needed.

6. Provide support for Level 4 commissioning activities, including providing adequate labor and support personnel to adjust equipment, modify logic and troubleshoot and repair system failures that might arise during pre-revenue testing.

7. Operate equipment and system during commissioning activities as required by the Testing and Commissioning Manager.

8. Perform and document commissioning tests to verify readiness for commissioning test demonstration. Commissioning tests are specified herein.

9. Correct issues and repeat commissioning tests when results do not meet acceptance criteria.

10. Commissioning Test Demonstrations: General requirements for commissioning test demonstrations are specified in the Contract Documents:

a. Repeat commissioning tests on a sample basis to demonstrate acceptable performance: Level 1 Component, Equipment, and System Commissioning Tests, and for Level 2 Intra-station system interface tests.

b. Record and submit commissioning test demonstration data and issues.

c. Correct issues and repeat commissioning test demonstration when results do not meet Acceptance Criteria.

11. Attend commissioning meetings as requested by the Testing and Commissioning Manager.

12. Report inconsistencies or issues in system operations or performance.

13. Provide personnel to support commissioning test demonstration specified herein as requested by the Testing and Commissioning Manager.

14. In the event that a commissioning test demonstration fails, assist in determining the cause of failure. Make corrections as necessary.

15. Cooperate with Testing and Commissioning Manager to make equipment and systems ready for commissioning tests specified herein as early in the construction schedule as possible.

16. Provide and maintain System alarm logs.

B. Cooperate with Testing and Commissioning Manager to accomplish commissioning work on schedule and in coordination with other trades.

C. Coordinate completion of Install Verification forms, by the Quality Control Inspector, as identified in the Contractors Quality Control Inspection and Test Plan.

1.04 SYSTEM ALARM LOGS

A. Daily at the start of days following a day in which commissioning tests or commissioning test demonstrations were performed, record log of alarms which occurred since the last log:

1. The intent of this requirement is to discover control system points or sequences left in manual or disabled conditions, abnormal set points, equipment left disconnected, or similar conditions which may have resulted from failure to fully restore systems to normal, automatic control following commissioning tests.

2. Evaluate alarms to determine if the previous day’s work resulted in any conditions that would not be considered “normal operation.”

3. Conditions that would not be considered “normal operation” shall be reported on a commissioning issue report attached to the alarm log. Resolve as necessary.

1.05 QUALITY ASSURANCE

A. Coordinate completion of Install Verification forms, by the Quality Control Inspector, as identified in the Contractors Quality Control Inspection and Test Plan.

PART 2 - PRODUCTS

2.01 TEST EQUIPMENT

A. Provide test equipment, instruments and tools, including consumable supplies, required to execute commissioning activities.

B. Provide proof of calibration of test equipment. Test equipment shall be calibrated within one year of use. A sticker from the calibration laboratory shall be affixed to the test equipment indicating date of calibration.

C. Provide any proprietary test instruments or tools required by the equipment manufacturer. Provide and operate the proprietary test instruments or tools as required for commissioning work.

PART 3 - EXECUTION

3.01 LEVEL 1 COMMISSIONING ACTIVITIES REQUIREMENTS

A. Level 1 commissioning activities scope: Technical requirements for commissioning of BMS are specified herein.

B. Provide technicians, instrumentation, and tools to perform commissioning activities in accordance with accepted commissioning activity procedures at the direction of the Testing and Commissioning Manager.

C. Scope of BMS commissioning activities applies to all portions of the BMS installation described in the test.

D. Upon approval of product submittals associated with Technical requirements and the scope of Commissioning develop and submit for approval Installation Verification Checklist forms for the quality criteria of the Work specified herein.

E. Preparation

1. Certify that BMS, subsystems, and equipment have been completed, calibrated, and started; and are operating in accordance with Contract Documents.

2. Testing Instrumentation: Install measuring instruments and logging devices to record test data in accordance with accepted commissioning test procedures as directed by the Testing and Commissioning Manager.

3. Certify that BMS instrumentation and control systems have been completed and calibrated; are operating according to the Contract Documents; and that pretest set points have been recorded.

F. Test all operating modes, interlocks, control responses, and responses to abnormal or emergency conditions, and verify proper response of building automation system controllers, and sensors.

G. Perform tests using design conditions whenever possible. If tests cannot be completed because of a deficiency outside the scope of the Equipment system, document the deficiency and report it to Sound Transit. After deficiencies are resolved, reschedule tests.

H. Simulated conditions may need to be imposed using an artificial load when it is not practical to test under design conditions. Provide equipment to simulate loads. Set simulated conditions in accordance with accepted commissioning test procedures as directed by the

Testing and Commissioning Manager. Document simulated conditions and methods of simulation. After tests, return settings to normal operating conditions.

I. Request approval to alter set points when simulating conditions is not practical. Request approval to alter sensor values with a signal generator when design or simulating conditions and altering set points are not practical.

J. If tests cannot be completed because of a deficiency outside the scope of the BMS, document the deficiency and report it to Sound Transit. After deficiencies are resolved, reschedule tests.

K. Where seasonal testing is specified, complete appropriate initial commissioning tests and documentation within the Construction Period. Schedule and execute seasonal tests when specified conditions are expected.

3.02 LEVEL 1 AND LEVEL 2 COMMISSIONING ACTIVITY PROCEDURES

A. Submit a single (combined) commissioning document (checklists, test procedures, forms) for all Level 1 commissioning activities as outlined below for the BMS for review and approval as outlined in Section 01 91 13 – General Systems Testing and Commisioning Requirements. The document must be broken up into sections with each activity and part separate with a sub header. Completed sections for each activity group (IV, SU, C, S) must be submitted upon completion.

B. Submit Level 1 commissioning activity test procedures and data forms for the following types of commissioning activities, requirements for which are specified herein:

1. Level 1 commissioning activities:

a. Installation verification.

b. Static tests.

c. Start-up procedures.

d. Component tests.

e. Equipment tests.

f. System tests.

2. Level 2 commissioning activities:

a. Intra-station system interface tests to external equipment.

3.03 LEVEL 1 INSTALLATION VERIFICATION CHECKLIST REQUIREMENTS

A. Installation verification checklist forms shall include the following:

1. Organized to prompt the installer to check off quality criteria for each discrete portion of the Work.

2. Identify the system or features to which the installation verification checklist applies at the top of the form.

3. Section for verification of delivery of accepted materials.

4. Section for condition of materials at delivery.

5. Section for description of installation steps. Include manufacturer’s installation instructions.

6. Space at the end of the form for the installer to print their name and company name, fill in the date, and sign or initial.

7. Space at the end of the form for the Quality Control inspector designated for the scope to review and accept installation verification. QC Inspector must perform Install Verification and verify each element identified in form has been reviewed for conformance with contract documents and in accordance with the Contractors Quality Control Inspection and Test Plan as part of Section 01 45 00 – Qualiity Assurance / Quality Control.

8. Space to identify the area of work for which the installer is executing the Installation Verification Checklist.

9. Description of the quality criteria as it pertains to the specific work. Include a check-box for each criterion.

10. Example checklists/test forms can be provided upon request.

B. Quality Criteria: Installation verification checklists shall address the following quality criteria:

1. Make and model match accepted submittals.

2. Equipment is installed without visible damage.

3. Location is as indicated on drawings.

4. Equipment is accessible for maintenance using safe work practices.

5. There is sufficient space to remove and replace components intact without demolishing other work.

6. Equipment and materials are clean.

7. Identification of wiring and components is complete, legible, located to be visible, and in accordance with contract requirements.

C. Fill out and sign installation verification checklists for BMS while the Work is being installed. The intent is for the installing tradesperson to fill out and sign the installation verification checklist as work proceeds to improve the quality of the installation. Print and post completed installation verification checklists near installed work on site.

D. Before performing a commissioning test, installation verification checklists must be performed and completed by QC inspector designated for the appropriate area specified herein and within the Contractors Quality Control Inspection and Test Plan as part of Section 01 45 00 – Qualiity Assurance / Quality Control. Submit completed installation verification checklists for work included in the commissioning test.

3.04 LEVEL 1 INSTALLATION VERIFICATION

A. [*Designer: Review identified IV's, E and S tests and add or modify as necessary based on location design of BMS.]*

B. The following installation verification activity is required prior to field installation:

1. 2508-IV-01 BMS Factory Tests and Inspections:

a. Documentation of factory tests and inspections, in accordance with requirements for field control system - garage, as stated in the Contract Documents, Article Factory Tests and Inspections.

C. The following installation verification activities are required after field installation:

1. 2508-IV-02 BMS enclosures including cabinets and racks, including:

   a. Print and maintain manufacturer shop drawings and wiring diagrams in each provided BMS enclosure.

2. 2508-IV-03 Local BMS HMI.

3. 2508-IV-06 BMS supervisory controller, equipment controllers and remote I/O.

4. 2508-IV-08 BMS communication cabling, including:

   a. All serial communication cables used in BMS applications as stated in the Contract Documents.

   b. All copper (ethernet) cables used in BMS applications as stated in the Contract Documents.

   c. All fiber communication cables used in BMS applications as stated in the Contract Documents.

   d. Interconnections between DCs and ITCs.

   e. For all instances, verify:

      1) Cables are organized

      2) Labels match shop drawings

      3) Cables are secured to prevent damage and allow access for maintenance

5. 2508-IV-09 BMS labeling and Identification.

3.05 LEVEL 1 STATIC TESTS (NOT USED)

3.06 LEVEL 1 START-UP

A. 2508-SU-01: BMS Start-up:

1. System/Equipment to be tested:

   a. Building Management System (BMS).

2. Functions to be tested:

   a. Branch circuit and control power supply connections.

   b. Communication between cabinets/enclosures/panels.

   c. System diagnostic functions.

3. Conditions of test:

   a. Prerequisite: All installation verification activities have been completed.

   b. Perform on-site start-up of BMS components in accordance with manufacturer's recommended procedures.

4. Acceptable Results:

   a. Start-up test functions demonstrate acceptable results.

b. Acceptable results of start-up procedures in accordance with manufacturer's recommendations.

3.07 LEVEL 1 COMPONENT TESTS (NOT USED)

3.08 LEVEL 1 EQUIPMENT TESTS (NOT USED)

3.09 LEVEL 1 SYSTEM TESTS

A. 2508-S-01: Operator Interfaces:

1. System/equipment to be tested: Operator Interfaces:

a. BMS HMI.

2. Functions to be tested:

a. Access to all station equipment and systems on BMS via the BMS log-in screen; will utilize the programming and control commands, control software programming languages, and graphical representations.

3. Conditions of the test:

a. Demonstrate input, output and programming access at the BMS HMI:

1) Operator selected display of input/output data in tabular or graphic format.

2) Equipment dynamic graphics.

3) System dynamic graphics.

4) Equipment status.

5) Equipment commands, including start/stop, open/close.

6) Analog input values.

7) Digital input values.

8) Digital output values.

9) Analog output values

10) Logs and reports.

11) Change analog limits.

12) Add, delete, or change points within each control unit or application routine.

13) Change point input/output descriptors, status, alarm descriptors, and engineering unit descriptors.

14) Add new control units to system.

15) Modify and set up maintenance scheduling parameters.

16) Develop, modify, delete or display full range of color graphic displays.

17) Automatically archive select data even when running third party software.

18) Provide capability to sort and extract data from archived files and to generate custom reports.

19) Operator selectable output of screen graphical images, data trend logs, and/or alarm summary information.

20) Automatic time and date stamped output of all system alarms and automatic or manual control system actions.

21) Select daily, weekly or monthly as scheduled frequency to synchronize time and date in digital control units. Accommodate daylight savings time adjustments.

22) Print selected control unit database to PDF.

23) Add and delete points.

24) Modify any point parameter.

25) Change, add, or delete English language descriptors.

26) Add, modify, or delete alarm limits.

27) Add, modify, or delete points in start/stop programs, trend logs, etc.

28) Create custom relationship between points.

29) Create or modify control loops and parameters.

30) Create or modify override parameters.

31) Add, modify, and delete any applications program.

32) Add, delete, develop, or modify dynamic color graphic displays.

4. Acceptance Criteria:

a. Inputs, outputs, graphics and control appear at the BMS HMIs and behave identically.

B. 2508-S-03: System Response Time:

1. System/equipment to be tested:

a. BMS controllers.

b. BMS communication.

2. Functions to be tested:

a. Speed of response and communication of inputs and outputs.

3. Conditions of the test:

a. Create a change of status input of a digital-monitored device.

b. Create a change of value at an analog input device.

c. Create a digital output to a digital-monitored device.

4. Acceptance Criteria:

a. Digital input changes: Indicated on HMI displays following field device change within an appropriate response time for the installed equipment.

b. Analog input changes beyond a change detection threshold: Indicated on HMI displays following field device change within an appropriate response time for the installed equipment.

c. Digital output commands entered at the HMI: Executed in the field within an appropriate response time for the installed equipment.

C. 2508-S-04: BMS Alarm Processing:

1. System/equipment to be tested:

a. BMS.

2. Functions to be tested:

a. Alarm generation and notification.

3. Conditions of the test:

a. Abnormal condition: Create abnormal condition.

b. Critical alarm or change of state: Create critical alarm.

c. Display alarm reports on video.

d. Time delay for equipment start-up or shutdown.

e. Unique routing of specific alarms. Generate alarms that are specified for unique routing.

f. Demonstrate selectable configuration of whether alarm requires acknowledgment.

g. Unacknowledged alarms after return to normal. Restore normal operation without acknowledging alarm.

h. Demonstrate alarm notification modes.

4. Acceptance Criteria:

a. Abnormal condition: Cause alarm and appropriate message, including time, system, point descriptor, and alarm condition.

b. Critical alarm or change-of-state: Display message, stored on disk for review and sort, or print.

c. Display alarm reports on video. Display multiple alarms in order of occurrence.

d. Capable of defining time delay for equipment start-up or shutdown.

e. Allow unique routing of specific alarms.

f. Operator selectable configuration specifies if alarm requires acknowledgment.

g. Continue to indicate unacknowledged alarms after return to normal.

h. Alarm notification actions:

1) Display indicating alarm condition.

2) Selectable audible alarm indication.

D. 2508-S-05: BMS Diagnostic Alarms:

1. System/equipment to be tested:

a. BMS controllers, including controller chassis, I/O chassis, and processor.

b. BMS communication.

2. Functions to be tested:

a. Response to detectable, non-fatal faults in the controller chassis or IO chassis.

1) Provide a summary warning alarm for all detectable, non-fatal faults in the controller chassis or I/O chassis.

2) Provide a summary fail alarm for major faults including failure of any BMS controller.

b. Response to major faults including failure of any BMS controller.

3. Conditions of the test:

a. Initiate detectable, non-fatal faults in controller chassis.

b. Initiate detectable, non-fatal faults in I/O chassis.

c. Simulate failure of BMS controller.

4. Acceptance Criteria:

a. System generates summary warning alarm for detectable, non-fatal faults in the controller chassis.

b. System generates summary warning alarm for detectable, non-fatal faults in the I/O chassis.

c. System generates summary fail alarm for major faults, including failure of BMS controller.

E. 2508-S-06: BMS interface to the following: BMS cabinet terminal strip, interface terminal cabinet terminal strip, and field equipment terminals:

1. System/equipment to be tested:

a. BMS discrete I/O modules.

b. BMS PLC interface to terminal strips.

c. BMS inputs and outputs.

2. Functions to be tested:

   a. Point level supervisory diagnostic capabilities.

3. Conditions of the test:

   a. At the terminal strip for a normally open alarm point simulate a contact closure.

   b. At the terminal strip for a normally closed alarm point simulate a contact open.

   c. At the terminal strip for an analog point simulate the value going from minimum to maximum.

   d. At the terminal strip for outputs simulate the following conditions in the below sequence:

      1) Off-state.

      2) No-load.

      3) On-state.

4. Acceptance Criteria:

   a. BMS HMI initiates alarm and correctly identifies the close (for normally open contact).

   b. BMS HMI initiates alarm and correctly identifies the open (for normally closed contact).

   c. BMS HMI show change from high to low value.

   d. The terminal strip show control pulse on the point.

F. 2508-S-07: Control Loop Tuning and Stability:

1. System/equipment to be tested:

   a. Each BMS control loop that consists of controller logic that monitors one or more process variable inputs, generates an analog or discrete control variable output that drives field equipment, and responds to a set point.

   b. Field instrumentation that monitors field conditions, including temperature, pressure, etc.

   c. Field equipment acted upon by the controller, including actuators, temperature control equipment, variable speed motors, etc.

   d. HMI screens that display process, control, and set point variables associated with a PLC or equipment controller.

2. Functions to be tested:

   a. Control loop adjustability and stability.

3. Conditions of the test:

a. Initiate a step change to the system by adjusting the loop set point up and down by 10 percent. Execute for each of the low, mid, and high portion of the adjustability range.

b. Disable and re-enable the field equipment to ensure the system recovers after disabling or failure.

c. Disable and re-enable the process variable instrument(s) to ensure the system recovers.

4. Acceptance Criteria:

a. Actuated field equipment responds to a change in set point without oscillation or excessive response delay, as demonstrated by HMI trends.

b. Zero difference after response delay between the commanded set point and measured process value as demonstrated by HMI trends.

c. The criteria described above are satisfied over the range of expected set points defined by the sequence of operation and the range of anticipated environmental conditions.

3.10 LEVEL 1 INTRA-STATION SYSTEM INTERFACE TESTING REQUIREMENTS

A. 2508-IS-01: HVAC Sequence of Operation:

1. [Designer: Review and add to or modify list as necessary based on location design. Coordinate with Division 23.]

2. System/Equipment to be tested:

a. Associated HVAC equipment as described in the Contract Documents

b. BMS:

3. Functions to be tested:

a. All HVAC I/O in the BMS Points List.

b. All HVAC control logic and sequences of operation.

4. Conditions of the test:

a. Prerequisites: Completion with acceptable results of Level 1 and Level 2 commissioning activities specified for System/equipment to be tested.

b. Verify display of specified parameters.

c. Create a change of state for each of the HVAC I/O points.

d. Send a digital output to each of the controls points in the HVAC I/O points.

e. Simulate the logic with required inputs to the BMS for control logic described in the mechanical subset.

5. Acceptable Results:

a. HVAC operating parameters are displayed correctly at the BMS HMI.

b. HVAC indications and alarms are annunciated correctly at the BMS HMI.

B. BMS perform logic the logic by providing the indicated displays and outputs as described for the HVAC control logic described in the Contract Documents.

C. 2508-IS-02: FACP Incident Response:

1. *[Designer: Review and add to or modify list as necessary based on location design. Coordinate with Division 28.]*

2. System/equipment to be tested:

   a. Fire alarm control panel (FACP).

   b. BMS controllers.

3. Functions to be tested:

   a. BMS response to FACP incident event.

4. Conditions of the test:

   a. Initiate an incident condition signal on FACP.

5. Acceptance Criteria:

   a. The Fire Alarm system generates a zone specific serial message of a detected event within the station.

   b. The BMS receives the indication from the FACP and provides a color change indication of the affected station zone on the BMS HMI's.

   c. The BMS executes the proper ventilation, HVAC, and station equipment operating configuration based on the applicable sequence of operations shown on the emergency response matrix, the Plans and in the related Sections, and transmits the recommended configuration and ready status to the BMS Link Control Interface.

   d. BMS automatically postures the station systems and equipment in the required configuration and initiates operation.

   e. BMS maintains equipment in its response state until smoke/fire event has been 'Cleared' at the FCC.

   f. Upon receipt of confirmation of event ending, BMS operator returns all ventilation, HVAC, and station equipment to normal operating configurations and states.

D. 2508-IS-03: HVAC - Fire Alarm Response

1. *[Designer: Review and add to or modify list as necessary based on location design. Coordinate with Division 23, 28.]*

2. System/equipment to be tested:

   a. HVAC units (i.e. Air Handling Units, Air Conditioning Units) and associated control devices.

   b. Supply and exhaust fans.

   c. Electric heating coils.

d. Fire smoke dampers.

e. Duct smoke detectors, where applicable.

f. Fire alarm system.

3. Functions to be tested:

a. Response of HVAC equipment and associated devices to fire alarm.

b. Response of HVAC equipment and associated devices to duct smoke detection, where applicable.

c. Response of HVAC equipment and associated devices to fire department override.

4. Conditions of the test:

a. Prerequisites: Completion with acceptable results of Level 1 and Level 2 commissioning activities specified for system/equipment to be tested.

b. Operate HVAC equipment in an unoccupied mode. Initiate a fire alarm.

c. If provided at the fire alarm control panel, override equipment shutdown.

d. Operate HVAC equipment in unoccupied mode with a call for heating. Initiate a fire alarm.

e. If provided at the fire alarm control panel, override equipment shutdown.

f. Operate HVAC equipment in unoccupied mode with a call for cooling. Initiate a fire alarm.

g. If provided at the fire alarm control panel, override equipment shutdown.

h. For equipment with duct smoke detection, operate in unoccupied mode and cause the duct smoke detector to activate.

i. Repeat conditions of the test with equipment in occupied mode.

5. Acceptance Criteria:

a. Documented completion of prerequisites.

b. For all conditions, HMI accurately reflects status of equipment and positions of devices.

c. Confirm HVAC equipment responds as described in the Contract Documents

E. 2508-IS-07: External Control and Monitoring Interface

1. *[Designer: Review and add to or modify list as necessary based on location design. Coordinate with other disciplines.]*

2. System/equipment to be tested:

a. BMS I/O connections for external control and monitoring applications as stated in the Contract Documents.

3. Functions to be tested:

a. External monitoring of BMS points: digital, analog, and network points.

b. External control of BMS points: digital, analog, and network points.

4. Conditions of the test:

a. BMS outputs to external interface: Verify accuracy of control parameter value represented at the external interface, relative to the value reported at the HMI for the same parameter.

b. External interface inputs to BMS: Verify BMS response to external interface inputs is accurate.

5. Acceptance Criteria:

a. BMS outputs to external interface are accurately represented at the external interface, relative to the value reported at the HMI for the same parameter.

b. BMS response to external interface inputs is accurate.

F. 2508-IS-08: Gas Detection Responses

1. [Designer: Review and add to or modify list as necessary based on location design. Coordinate with Division 23, 28.]

2. System/equipment to be tested:

a. All gas detection devices used in BMS applications including for carbon monoxide (CO), nitrogen dioxide (NO2), and/or hydrogen (H2) detection.

b. Associated exhaust/ventilation fans and dampers.

3. Functions to be tested:

a. Fan response to schedule.

b. Fan response to gas detection alarms.

c. Fan alternation if applicable.

d. Fan failover if applicable.

4. Conditions of the test:

a. Exceed gas detection alarm setpoints via calibration kits at the detection device or alternate method as detailed in commissioning form procedures

b. Occupied and unoccupied modes.

5. Acceptance Criteria:

a. Fans and dampers respond as intended.

b. Alarms are indicated and logged.

G. 2508-IS-10: Pump Station Control

1. [Designer: Review and add to or modify list as necessary based on location design. Coordinate with Division 22.]

2. System/equipment to be tested:

   a. Pump Station controller .

   b. BMS controller.

3. Functions to be tested:

   a. Correct mapping of PLC I/O points in BMS.

   b. Monitoring PLC inputs by BMS.

4. Conditions of the test:

   a. One by one, alter the values of inputs monitored by the BMS by changing the physical condition of the input sensed by the BMS.

5. Acceptance Criteria:

   a. Sensed condition is reported correctly by BMS.

3.11 LEVEL 1 AND LEVEL 2 TEST REQUIREMENTS MATRIX

	2508-IV-0X	2508-ST-0X	2508-SU-0X	2508-C-0X	2508-E-0X	2508-S-0X	2508-IS-0X
Factory Tests and Inspections	X						
Enclosures	X

[DESIGNER: ADD OR MODIFY MATRIX AS NECESSARY BASED ON TESTS ADDED OR MODIFIED ABOVE DEPENDING UPON THE LOCATION DESIGN FOR BMS]

3.12 LEVEL 3 INTER-STATION SYSTEM INTERFACE TEST REQUIREMENTS (NOT USED)

3.13 LEVEL 3 COORDINATION WITH OTHER CONTRACTORS

A. Provide as-built copies of the Points List to the Sound Transit when required by the Contract. These are necessary for the contractors to design their control system.

B. Continuity Testing: To expedite continuity testing, supply as-built Points List within thirty days after all points have been successfully tested and signed-off.

C. Control System Testing: Following the continuity testing, other contractors will verify the functionality of integration of this Contract controls with that of other contracts. The Control System Testing period will last 30 days. This period begins when Systems Integration Testing has been completed.

D. During the Continuity Testing and Control System Testing periods, perform the following:

1. Jointly field test points in the interface terminal strips with the applicable systems contractors and verify the operation and monitoring of equipment as shown on the Contract Drawings, wiring diagrams, and Points List.

2. Be present during this testing period with adequate labor and support personnel to adjust equipment and troubleshoot system failures that might arise. When a piece of mechanical or electrical equipment is found to be in conflict with specific criteria, have an experienced representative of the manufacturer make an adjustment to the item. If adjustments fail to correct the operation of a piece of equipment or fixture, remove the equipment or fixture from the Contract site and replace it with a workable replacement that will meet the specification requirements.

E. Provide support to integrate the Garage with the existing Sound Transit Honeywell infrastructure.

3.14 LEVEL 3 AND LEVEL 4 SYSTEM TESTS

A. System Test checklists are required to include the following, at a minimum:

1. 2508-ISIS-02: Central EPMS Integration:

a. System / Equipment to be tested:

1) Submeter to Central WinPM.Net server communication.

2) Central EPMS server configuration and functionality for additional submeters.

3) Central EPMS server is existing. Configuration is updated to include additional submeters.

b. Functions to be tested:

1) Screen elements, data logging, alarming, data historian, and trending functions of the Central EPMS server for additional submeters.

c. Conditions of test:

1) Level 1 commissioning activities for submeters is completed.

2) Communication between submeters and the Central EPMS server are operational and perform as expected.

d. Acceptable Results:

1) Screen elements, data logging, alarming, data historian, and trending functions of the Central EPMS server for additional submeters are functioning correctly.

LEVEL 3 AND LEVEL 4 TEST REQUIREMENTS MATRIX

	2508-ISIS-0X
Central EPMS Integration	X

[DESIGNER: ADD OR MODIFY MATRIX AS NECESSARY BASED ON TESTS ADDED OR MODIFIED ABOVE DEPENDING UPON THE LOCATION DESIGN FOR BMS]

EXHIBIT A

EXAMPLE TEST PROCEDURE

3.01 TEST INFORMATION

Test ID:	*2508-S-01 BMS Operator Interface*
Date Time and Location:	
First Test, Repeat Test or Demonstration:	
Equipment IDs:	

3.02 OBJECTIVES

A. Verify performance of BMS Operator Interface (HMI)

B. Reference section 25 08 00 3.09A

3.03 SYSTEMS AND EQUIPMENT TO BE TESTED

A. Access to all station equipment and systems on BMS via the BMS log-in screen; will utilize the programming and control commands, control software programming languages, and graphical representations.

3.04 PREREQUISITES

A. BMS equipment communicates successfully over network	Y___N___
B. BMS equipment has passed Start-Up test	Y___N___
C. System alarm log captured prior to testing	Y___N___

3.05 MINIMUM PARTICIPANTS

A. Test Technician

B. Owner's Witness

3.06 TEST PROCEDURE

A. In accordance with general conditions of the contract, contractor shall be responsible for initiating, maintaining, and supervising all safety precautions and programs in connection with the performance of this test. Stop the test and notify the owner if it is determined that any part of the test cannot be performed safely. Reference section 25 08 00 3.09A

B. Perform and document the following steps in the order listed. Acceptance criteria are listed below each step.

C.	To verify proper functionality of the BMS operator interface, demonstrate the following on the BMS HMI:		
	1.	Operator selected display of input/output data in tabular or graphic format.	PASS___ FAIL___
	2.	Equipment dynamic graphics	PASS___ FAIL___
	3.	System dynamic graphics	PASS___ FAIL___
	4.	Equipment status	PASS___ FAIL___
	5.	Equipment commands including start/stop, open/close	PASS___ FAIL___
	6.	Analog input values read expected values correctly	PASS___ FAIL___
	7.	Analog output values read expected values correctly	PASS___ FAIL___
	8.	Digital input values read expected values correctly	PASS___ FAIL___
	9.	Digital output values read expected values correctly	PASS___ FAIL___
	10.	Networked input values read expected values correctly	PASS___ FAIL___
	11.	Networked output values read expected values correctly	PASS___ FAIL___
	12.	Logs and reports functional	PASS___ FAIL___
	13.	Analog setpoint changes demonstrated	PASS___ FAIL___
	14.	Ability to add, delete, modify points demonstrated	PASS___ FAIL___
	15.	Ability to modify point descriptions, status, alarms and engineering units demonstrated	PASS___ FAIL___
	16.	Ability to develop, modify, delete or display full range of color graphic displays	PASS___ FAIL___
	17.	Automatically archive select data while running third party software	PASS___ FAIL___

18.	Capability to sort and extract data from archived files and generate custom reports	PASS___ FAIL___
19.	Operator selectable output of screen graphical images, data trend logs, and alarm summary information	PASS___ FAIL___
20.	Automatic time and date stamped output of all system alarms and automatic or manual control system actions	PASS___ FAIL___
21.	Machine date and time settings accurate	PASS___ FAIL___
22.	Demonstrate ability to export HMI point configurations to .csv or other acceptable file format	PASS___ FAIL___
23.	Ability to start/stop HMI program demonstrated, printed instructions are posted near installation	PASS___ FAIL___
24.	Ability to override point values and other parameters demonstrated	PASS___ FAIL___

3.07 ACCEPTANCE CRITERIA

A. Observed results shall comply with acceptance criteria in the procedure above.

3.08 TEST RESULTS

A. Record test conditions and results on the Test Procedure in the spaces provided above at the time of the test. Record results legibly in ink.

3.09 OBSERVATIONS NOTED OR CORRECTIVE ACTIONS REQUIRED

#	Description	Resolution	Retest Req'd
			Y___N___
			Y___N___

3.10 SIGNATURES

A. The undersigned have witnessed the above test and verified that the test was performed in accordance with the Approved Commissioning Test Procedure and that the results recorded were the actual results observed.

SECTION 25 08 60

COMMISSIONING OF LINK STATION CONTROLS

NOTE TO DESIGNER:

SECTIONS WITH BRACKETS. E.G., [TEXT] ARE TO BE MODIFIED OR DELETED IF NOT APPLICABLE. ITALICIZED TEXT PROVIDES INSTRUCTION TO THE DESIGNER TO INCLUDE LANGUAGE ON SPECIFIC TOPICS WHEN APPLICABLE. THE INSTRUCTIONS ARE TO BE DELETED WHEN THE SPECIFICATION IS FINALIZED. LANGUAGE NOT IN BRACKETS IS TO BE USED ‘AS IS’ WITHOUT MODIFICATION ORWITH AN APPROVED SPECIFICATION MODIFICATION REQUEST.

DESIGNER TO DELETE TEXT ABOVE FOR FINAL SECTION

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for the commissioning process for Link Station Building Management System (BMS) and the Emergency Ventilation System (EVS). Together when describing elements that apply to both systems they are referred to as Field Control System or FCS:

a. Level 1 commissioning activities for FCS.

b. Level 2 commissioning activities for interface verification between systems within this Contract.

c. Level 3 commissioning and support for Level 3 commissioning activities for interface verification between systems provided under this Contract with systems provided by others.

d. Support for Level 4 commissioning activities related to pre-revenue testing.

B. Any LEED execution requirements for commissioning of FCS are in accordance with the LEED certification requirements (including the LEED specifications matrix requirements) as stated in the Contract Documents.

1. Integration of submeters into central Energy and Power Monitoring System (EPMS) is an activity which will require coordination with Division 22 and Division 26 Work.

C. Definitions:

1. See general commissioning definitions as stated in Contract or Reference Documents.

2. Command: When used in relation to an FCS commissioning activity, command refers to an instruction or signal sent from a human machine interface (HMI) for the FCS to control systems or specific equipment.

3. Human Machine Interface (HMI): The user interface comprised of equipment, software, and functional programming shown on the Plans and as specified in requirements for field control system as stated in the Contract Documents.

4. Systems, Equipment, and Components: Where these terms are used together or separately, they shall mean "as-built" systems, equipment, and components.

1.02 COORDINATION

A. See general commissioning requirements as stated in the Contract Documents for general coordination requirements related to commissioning.

1.03 COMMISSIONING ACTIVITIES

A. Commissioning work furnishes labor and material to accomplish FCS commissioning as specified in general commissioning requirements as stated in the Contract Documents, and herein, including:

1. Provide to the Testing and Commissioning Manager preliminary O&M information for use in developing commissioning test procedures.

2. Assist the Testing and Commissioning Manager in developing commissioning activity procedures and data forms submittals for work specified in this Section.

3. Provide information to the Testing and Commissioning Manager needed for control interface wiring diagrams submittals for the work of this Section.

4. Perform Level 1 and Level 2 commissioning activities specified in this Section, including installation verification, static tests, start-up, component tests, equipment tests, systems tests, and intrastation system interface tests.

5. Provide Level 3 commissioning and support for Level 3 commissioning activities:

a. Include field testing points in the interface terminal cabinets (ITCs) and communications distribution cabinets (DCs), being present during Level 3 testing with adequate labor and support personnel to adjust equipment and troubleshoot system failures that might arise. When material or equipment provided in this contract is found to be in conflict with specified criteria, adjust or replace said material or equipment, with the assistance of manufacturer as needed.

b. Include field testing emergency ventilation modes that includes fans, EVCP, FDCPs, PLCs, remote I/O, and networking equipment provided by this contract. Provide adequate labor and support personnel to adjust equipment and troubleshoot system failures that might arise. When material, logic or equipment provided in this contract is found to be in conflict with specified criteria, adjust, modify or replace said material or equipment, with the assistance of manufacturer or integrator as needed.

6. Provide support for Level 4 commissioning activities, including providing adequate labor and support personnel to adjust equipment, modify logic and troubleshoot and repair system failures that might arise during pre-revenue testing.

7. Operate equipment and system during commissioning activities as required by the Testing and Commissioning Manager.

8. Perform and document commissioning tests to verify readiness for commissioning test demonstration. Commissioning tests are specified herein.

9. Correct issues and repeat commissioning tests when results do not meet acceptance criteria.

10. Commissioning Test Demonstrations: General requirements for commissioning test demonstrations are specified in general commissioning requirements as stated in the Contract Documents.

    a. Repeat commissioning tests on a sample basis to demonstrate acceptable performance: Level 1 Component, Equipment, and System Commissioning Tests, and for Level 2 Intra-station system interface tests.

    b. Record and submit commissioning test demonstration data and issues.

    c. Correct issues and repeat commissioning test demonstration when results do not meet Acceptance Criteria.

11. Attend commissioning meetings as requested by the Testing and Commissioning Manager.

12. Report inconsistencies or issues in system operations or performance.

13. Provide personnel to support commissioning test demonstration specified herein as requested by the Testing and Commissioning Manager.

14. In the event that a commissioning test demonstration fails, assist in determining the cause of failure. Make corrections as necessary.

15. Cooperate with Testing and Commissioning Manager to make equipment and systems ready for commissioning tests specified herein as early in the construction schedule as possible.

16. Provide and maintain System alarm logs.

B. Cooperate with Testing and Commissioning Manager to accomplish commissioning work on schedule and in coordination with other trades.

C. Coordinate completion of Install Verification forms, by the Quality Control Inspector, as identified in the Contractors Quality Control Inspection and Test Plan.

1.04 SYSTEM ALARM LOGS

A. Daily at the start of days following a day in which commissioning tests or commissioning test demonstrations were performed, record log of alarms which occurred since the last log.

    1. The intent of this requirement is to discover control system points or sequences left in manual or disabled conditions, equipment left disconnected, or similar conditions which may have resulted from failure to fully restore systems to normal, automatic control following commissioning tests.

    2. Evaluate alarms to determine if the previous day’s work resulted in any conditions that would not be considered “normal operation.”

    3. Conditions that would not be considered “normal operation” shall be reported on a commissioning issue report attached to the alarm log. Resolve as necessary.

1.05 QUALITY ASSURANCE

A. Coordinate completion of Install Verification forms, by the Quality Control Inspector, as identified in the Contractors Quality Control Inspection and Test Plan.

PART 2 - PRODUCTS

2.01 TEST EQUIPMENT

A. Provide test equipment, instruments and tools, including consumable supplies, required to execute commissioning activities.

B. Provide proof of calibration of test equipment. Test equipment shall be calibrated within one year of use. A sticker from the calibration laboratory shall be affixed to the test equipment indicating date of calibration.

C. Provide any proprietary test equipment, instruments and tools required by the equipment manufacturer. Provide and operate the proprietary test instruments or tools as required for commissioning work.

PART 3 - EXECUTION

3.01 LEVEL 1 COMMISSIONING ACTIVITIES REQUIREMENTS

A. Level 1 commissioning activities scope: Technical requirements for commissioning of FCS are specified herein.

B. Provide technicians, instrumentation, and tools to perform commissioning activities in accordance with accepted commissioning activity procedures at the direction of the Testing and Commissioning Manager.

C. Scope of FCS commissioning activities applies to all portions of the FCS installation described in the test.

D. Upon approval of product submittals associated with Technical requirements and the scope of Commissioning develop and submit for approval Install Verification Checklist forms for the quality criteria of the Work specified herein.

E. Preparation

1. Certify that FCS, subsystems, and equipment have been completed, calibrated, and started; and are operating in accordance with Contract Documents.

2. Testing Instrumentation: Install measuring instruments and logging devices to record test data in accordance with accepted commissioning test procedures as directed by the Testing and Commissioning Manager.

3. Certify that FCS instrumentation and control systems have been completed and calibrated; are operating according to the Contract Documents; and that pretest set points have been recorded.

4. Set systems, subsystems, and equipment into operating mode to be tested (e.g., normal shut down, normal auto position, normal manual position, unoccupied cycle, emergency power, and alarm conditions) in accordance with accepted commissioning test procedures as directed by the Testing and Commissioning Manager.

F. Test all operating modes, interlocks, control responses, responses to abnormal or emergency conditions for all Contractor provided equipment connected to the FCS, and verify proper response of FCS, controllers, and sensors.

G. Perform tests using design conditions whenever possible.

H. Simulated conditions may need to be imposed using an artificial load when it is not practical to test under design conditions. Provide equipment to simulate loads. Set simulated conditions in accordance with accepted commissioning test procedures as directed by the Testing and Commissioning Manager. Document simulated conditions and methods of simulation. After tests, return settings to normal operating conditions.

I. Request approval to alter set points when simulating conditions is not practical. Request approval to alter sensor values with a signal generator when design or simulating conditions and altering set points are not practical.

J. If tests cannot be completed because of a deficiency outside the scope of the FCS, document the deficiency and report it to Sound Transit. After deficiencies are resolved, reschedule tests.

K. Where seasonal testing is specified, complete appropriate initial commissioning tests and documentation within the Construction Period. Schedule and execute seasonal tests when specified conditions are expected.

3.02 LEVEL 1 AND LEVEL 2 COMMISSIONING ACTIVITY PROCEDURES

A. Submit a single (combined) commissioning document (checklists, test procedures, forms) for all Level 1 commissioning activities as outlined below for the FCS for review and approval as outlined in Section 01 91 13 – General Systems Testing and Commissioning Requirements. The document must be broken up into sections with each activity and part separate with a sub header. Completed sections for each activity group (IV, SU, C, S) must be submitted upon completion.

B. Submit Level 1 commissioning activity test procedures and data forms for the following types of commissioning activities, requirements for which are specified herein.

1. Level 1 commissioning activities:

a. Installation verification

b. Static tests

c. Start-up procedures

d. Component tests

e. Equipment tests

f. System tests

2. Level 2 commissioning activities:

a. Intra-station system interface tests to external equipment.

3.03 LEVEL 1 INSTALLATION VERIFICATION CHECKLIST REQUIREMENTS

A. Installation verification checklist forms shall include the following:

1. Organized to prompt the installer to check off quality criteria for each discrete portion of the Work.

2. Identify the system or features to which the installation verification checklist applies at the top of the form.

3. Section for verification of delivery of accepted materials.

4. Section for condition of materials at delivery.

5. Section for description of installation steps. Include manufacturer's installation instructions.

6. Space at the end of the form for the installer to print their name and company name, fill in the date, and sign or initial.

7. Space at the end of the form for the Quality Control inspector designated for the scope to review and accept installation verification. QC Inspector must perform Install Verification and verify each element identified in form has been reviewed for conformance with contract documents and in accordance with the Contractors Quality Control Inspection and Test Plan as part of Section 01 45 00 – Quality Assurance / Quality Control.

8. Space to identify the area of work for which the installer is executing the Installation Verification Checklist.

9. Description of the quality criteria as it pertains to the specific work. Include a check-box for each criterion.

10. Example checklists/test forms can be provided upon request.

B. Quality Criteria: Installation verification checklists shall address the following quality criteria.

1. Make and model match accepted submittals.

2. Equipment is installed without visible damage.

3. Location is as indicated on drawings.

4. Equipment is accessible for maintenance using safe work practices.

5. There is sufficient space to remove and replace components intact without demolishing other work.

6. Equipment and materials are clean.

7. Identification of wiring and components is complete, legible, located to be visible, and in accordance with contract requirements.

C. Fill out and sign installation verification checklists for FCS while the Work is being installed. The intent is to fill out and sign the installation verification checklist as work proceeds to improve the quality of the installation. Print and post completed installation verification checklists near installed work on site.

D. Before performing a commissioning test, installation verification checklists must be performed and completed by QC inspector designated for the appropriate area specified herein and within the Contractors Quality Control Inspection and Test Plan as part of Section 01 45 00 – Quality Assurance / Quality Control. Submit completed installation verification checklists for work included in the commissioning test.

3.04 LEVEL 1 INSTALLATION VERIFICATION

A. [*Designer: Review identified IV's, E and S tests and add or modify as necessary based on location design for FCS.]*

B. The following installation verification activitiy is required prior to field installation:

1. 2508-IV-01 FCS Factory Tests and Inspections

a. Documentation of factory tests and inspections shall be in accordance with requirements for field control system, as stated in the Contract Documents.

C. The following installation verification activities are required after field installation:

1. 2508-IV-02 FCS enclosures including FCS cabinets and racks.

   a. Print and maintain manufacturer shop drawings and wiring diagrams in each provided FCS enclosure.

2. 2508-IV-03 Local FCS HMI.

3. 2508-IV-06 FCS PLCs and Remote I/O.

4. 2508-IV-08 FCS Communication Copper and Fiber Cabling, including:

   a. All serial communication cables used in an FCS application as statedin the Contract Documents.

   b. All copper (ethernet) cables used in an FCS application as stated in the Contract Documents.

   c. All fiber communication cables used in an FCS application as stated in the Contract Documents

   d. Interconnections between the DCs to the ITCs.

   e. For all instances, verify:

      1) Cables are organized

      2) Labels match shop drawings

      3) Cables are secured to prevent damage and allow access for maintenance

5. 2508-IV-09 FCS Labeling and Identification.

3.05 LEVEL 1 STATIC TESTS (NOT USED)

3.06 LEVEL 1 START-UP

A. 2508-SU-01: FCS Start-up:

1. System/Equipment to be tested:

   a. Building Management System (BMS).

   b. Emergency Ventilation System (EVS).

2. Functions to be tested:

   a. Branch circuit and control power supply connections.

   b. Communication protocols between cabinets/enclosures/panels.

   c. System diagnostic functions.

3. Conditions of test:

a. Prerequisite: All installation verification activities have been completed.

b. Perform on-site start-up of FCS in accordance with manufacturer's recommended procedures.

c. Perform on-site start-up of all EVS Control Panels in accordance with manufacturer's recommended procedures.

4. Acceptable Results:

a. Start-up test functions demonstrate acceptable results.

b. Acceptable results of start-up procedures in accordance with manufacturer's recommendations.

3.07 LEVEL 1 COMPONENT TESTS (NOT USED)

3.08 LEVEL 1 EQUIPMENT TESTS (NOT USED)

3.09 LEVEL 1 SYSTEM TESTS

A. 2508-S-01: Operator Interfaces:

1. System/equipment to be tested: Operator Interfaces:

a. BMS HMI.

b. EVS HMI

2. Functions to be tested:

a. Access to all station equipment and systems on BMS via the BMS log-in screen; will utilize the programming and control commands, control software programming languages, and graphical representations.

b. Access to all station equipment and systems on EVS via the EVCP log-in screen; will utilize the programming and control commands, control software programming languages, and graphical representations.

c. Access to EVS fan and damper equipment and systems on EVS via the distributed control panel screens; will utilize the programming and control commands, control software programming languages, and graphical representations.

3. Conditions of the test:

a. Demonstrate input, output and programming access at the FCS HMI:

1) Operator selected display of input/output data in tabular or graphic format.

2) Equipment dynamic graphics.

3) System dynamic graphics.

4) Equipment status.

5) Equipment commands, including start/stop, open/close.

6) Analog input values.

7) Analog output values

8) Digital input values.

9) Digital output values.

10) Logs and reports.

11) Change analog limits.

12) Add, delete, or change points within each control unit or application routine.

13) Change point input/output descriptors, status, alarm descriptors, and engineering unit descriptors.

14) Add new control units to system.

15) Modify and set up maintenance scheduling parameters.

16) Develop, modify, delete or display full range of color graphic displays.

17) Automatically archive select data even when running third party software.

18) Provide capability to sort and extract data from archived files and to generate custom reports.

19) Operator selectable output of screen graphical images, data trend logs, and/or alarm summary information.

20) Automatic time and date stamped output of all system alarms and automatic or manual control system actions.

21) Select daily, weekly or monthly as scheduled frequency to synchronize time and date in digital control units. Accommodate daylight savings time adjustments.

22) Print selected control unit database to PDF.

23) Add and delete points.

24) Modify any point parameter.

25) Change, add, or delete English language descriptors.

26) Add, modify, or delete alarm limits.

27) Add, modify, or delete points in start/stop programs, trend logs, etc.

28) Create custom relationship between points.

29) Create or modify control loops and parameters.

30) Create or modify override parameters.

31) Add, modify, and delete any applications program.

32) Add, delete, develop, or modify dynamic color graphic displays.

4. Acceptance Criteria:

a. Inputs, outputs, graphics and control appear at the FCS HMIs.

B. 2508-S-02: Control Redundancy:

1. System/equipment to be tested:

a. PLC CPU and Remote I/O control and communication redundancy.

b. BMS I/O processing system.

c. EVS I/O processing system.

2. Functions to be tested:

a. Seamless switchover from failed unit/communication facility.

3. Conditions of the test:

a. Disconnect power from active Ethernet switch.

b. Restore power to the Ethernet switch.

c. Disconnect power from active BMS server.

d. Restore power to the BMS server.

e. Disconnect power from active BMS control chassis.

f. Restore power to the active BMS control chassis.

g. Disconnect power from active EVS control chassis.

h. Restore power to the active EVS control chassis.

i. Disconnect a communication cable.

j. Reconnect a communication cable.

4. Acceptance Criteria:

a. Under all conditions, disabling an active component results in the associated redundant unit assuming the functions of the disabled unit without loss of control or communication. During the switchover, outputs shall experience a bump-free switchover. For example, outputs are maintained in their current state and do not revert to a previous state. On restoration of power the equipment returns to normal operation.

b. Under all conditions, disabling an active controller, Ethernet switch, or communication cable results in an alarm at the LCC. Restoration of the equipment clears the alarm.

C. 2508-S-03: System Response Time:

1. System/equipment to be tested:

a. FCS controllers.

b. FCS communication.

2. Functions to be tested:

a. Speed of response and communication of inputs and outputs.

3. Conditions of the test:

a. Create a change of status input of a digital-monitored device.

b. Create a change of value at an analog input device.

c. Create a digital output to a digital-monitored device.

4. Acceptance Criteria:

a. Digital input changes: Indicated on HMI displays within a maximum of 2 seconds following field device change.

b. Analog input changes beyond a change detection threshold: Indicated on HMI displays within a maximum of 5 seconds following field device change.

c. Digital output commands entered at the HMI: Executed in the field within a maximum of 2 seconds following command execution.

D. 2508-S-04: FCS Alarm Processing:

1. System/equipment to be tested:

a. FCS.

2. Functions to be tested:

a. Alarm generation and notification.

3. Conditions of the test:

a. Abnormal condition: Create abnormal condition.

b. Critical alarm or change of state: Create critical alarm.

c. Display alarm reports on video.

d. Time delay for equipment start-up or shutdown.

e. Unique routing of specific alarms. Generate alarms that are specified for unique routing.

f. Demonstrate selectable configuration of whether alarm requires acknowledgment.

g. Unacknowledged alarms after return to normal. Restore normal operation without acknowledging alarm.

h. Demonstrate alarm notification modes.

4. Acceptance Criteria:

a. Abnormal condition: Cause alarm and appropriate message, including time, system, point descriptor, and alarm condition.

b. Critical alarm or change-of-state: Display message, stored on disk for review and sort, or print.

c. Display alarm reports on video. Display multiple alarms in order of occurrence.

d. Capable of defining time delay for equipment start-up or shutdown.

e. Allow unique routing of specific alarms.

f. Operator selectable configuration specifies if alarm requires acknowledgment.

g. Continue to indicate unacknowledged alarms after return to normal.

h. Alarm notification actions:

1) Display indicating alarm condition.

2) Selectable audible alarm indication

E. 2508-S-05: FCS Diagnostic Alarms:

1. System/equipment to be tested:

a. FCS controllers, including controller chassis, I/O chassis, PLC processor.

b. FCS communication.

2. Functions to be tested:

a. Response to detectable, non-fatal faults in the controller chassis or IO chassis.

1) Provide a summary PLC warning alarm for all detectable, non-fatal faults in the controller chassis or I/O chassis.

2) Provide a summary PLC fail alarm for major faults including failure of either PLC processor.

b. Response to major faults including failure of either PLC processor.

3. Conditions of the test:

a. Initiate detectable, non-fatal faults in controller chassis.

b. Initiate detectable, non-fatal faults in I/O chassis.

c. Simulate failure of PLC processor.

4. Acceptance Criteria:

a. System generates summary PLC warning alarm for detectable, non-fatal faults in the controller chassis.

b. System generates summary PLC warning alarm for detectable, non-fatal faults in the I/O chassis.

c. System generates summary PLC fail alarm for major faults, including failure of PLC processor

F. 2508-S-06: FCS interface to the following: Distribution cabinet terminal strip, interface terminal cabinet terminal strip, and field equipment terminals:

1. System/equipment to be tested:

   a. FCS discrete I/O modules

   b. FCS PLC interface to terminal strips

   c. FCS inputs and outputs

2. Functions to be tested:

   a. Point level supervisory diagnostic capabilities

3. Conditions of the test:

   a. At the terminal strip for a normally open alarm point simulate a contact closure

   b. At the terminal strip for a normally closed alarm point simulate a contact open.

   c. At the terminal strip for an analog point simulate the value going from minimum to maximum.

   d. At the terminal strip for outputs simulate the following conditions in the below sequence:

      1) Off-state.

      2) No-load.

      3) On-state.

4. Acceptance Criteria:

   a. FCS HMI initiates alarm and correctly identifies the close (for normally open contact).

   b. FCS HMI initiates alarm and correctly identifies the open (for normally closed contact).

   c. FCS HMI show change from high to low value.

   d. The terminal strip show control pulse on the point.

G. 2508-S-07: Control Loop Tuning and Stability:

1. System/equipment to be tested:

   a. Each FCS control loop that consists of controller logic that monitors one or more process variable inputs, generates an analog or discrete control variable output that drives field equipment, and responds to a set point.

   b. Field instrumentation that monitors field conditions, including temperature, pressure, etc.

   c. Field equipment acted upon by the controller, including actuators, temperature control equipment, variable speed motors, etc.

d. HMI screens that display process, control, and set point variables associated with a PLC or equipment controller.

2. Functions to be tested:

a. Control loop adjustability and stability.

3. Conditions of the test:

a. Initiate a step change to the system by adjusting the loop set point up and down by 10 percent. Execute for each of the low, mid, and high portion of the adjustability range.

b. Disable and re-enable the field equipment to ensure the system recovers after disabling or failure.

c. Disable and re-enable the process variable instrument(s) to ensure the system recovers.

4. Acceptance Criteria:

a. Actuated field equipment responds to a change in set point without oscillation or excessive response delay, as demonstrated by HMI trends.

b. Zero difference after response delay between the commanded set point and measured process value as demonstrated by HMI trends.

c. The criteria described above are satisfied over the range of expected set points defined by the sequence of operation and the range of anticipated environmental conditions.

3.10 LEVEL 2 INTRA-STATION SYSTEM INTERFACE TESTING REQUIREMENTS

A. 2508-IS-01: HVAC Sequence of Operation:

1. [Designer: Review and add to or modify list as necessary based on location design. Coordinate with Division 23.]

2. System/Equipment to be tested:

a. Associated HVAC equipment as described in the Contract Documents.

b. FCS.

3. Functions to be tested:

a. All HVAC I/O in the FCS Points List.

b. All HVAC control logic and sequences of operation

4. Conditions of the test:

a. Prerequisites: Completion with acceptable results of Level 1 and Level 2 commissioning activities specified for System/equipment to be tested.

b. Verify display of specified parameters.

c. Create a change of state for each of the HVAC I/O points.

d. Send a digital output to each of the controls points in the HVAC I/O points.

e. Simulate the logic with required inputs to the FCS for control logic described in the mechanical subset.

5. Acceptable Results:

a. HVAC operating parameters are displayed correctly at the FCS HMI.

b. HVAC indications and alarms are annunciated correctly at the FCS HMI.

6. FCS perform logic the logic by providing the indicated displays and outputs as described for the HVAC control logic described in the Contract Documents.

B. 2508-IS-02: FACP Incident Response:

1. [Designer: Review and add to or modify list as necessary based on location design. Coordinate with Division 28.]

2. System/equipment to be tested:

a. Fire alarm control panel (FACP).

b. FCS controllers.

c. FCS HMIs.

3. Functions to be tested:

a. FCS response to FACP incident event.

b. FACP response to FCS initiated event.

4. Conditions of the test:

a. Initiate an incident condition signal on FACP.

b. Initiate an incident condition on the FCS.

5. Acceptance Criteria:

a. The Fire Alarm system generates a zone specific serial message of a detected event within the station.

b. The FCS receives the indication from the FACP and provides a color change indication of the affected station zone on the FCS HMI's.

c. The FACP receives the signal from the FCS corresponding to an event initiated on the FCS and responds by sending appropriate feedback to the FCS.

d. The FCS executes the proper ventilation, HVAC, and station equipment operating configuration based on the applicable sequence of operations shown on the emergency response matrix, the Plans and in the related Sections, and transmits the recommended configuration and ready status to the FCS Link Control Interface.

e. Incident response status, alarm, and control information is displayed on the BMS workstation console and the EVCP.

f. FCS automatically postures the station systems and equipment in the required configuration and initiates operation.

g. FCS maintains equipment in its response state until smoke/fire event has been ‘Cleared’ at the FCC.

h. Upon receipt of confirmation of event ending, FCS operator returns all ventilation, HVAC, and station equipment to normal operating configurations and states.

C. 2508-IS-03: HVAC – Fire Alarm Response:

1. *[Designer: Review and add to or modify list as necessary based on location design. Coordinate with Division 23, 28.]*

2. System/equipment to be tested:

a. HVAC units (i.e. Air Handling Units, Air Conditioning Units) and associated control devices.

b. Supply and exhaust fans.

c. Electric heating coils.

d. Fire smoke dampers.

e. Duct smoke detectors, where applicable.

f. Fire alarm system.

3. Functions to be tested:

a. Response of HVAC equipment and associated devices to fire alarm.

b. Response of HVAC equipment and associated devices to duct smoke detection, where applicable.

c. Response of HVAC equipment and associated devices to fire department override.

4. Conditions of the test:

a. Prerequisites: Completion with acceptable results of Level 1 and Level 2 commissioning activities specified for system/equipment to be tested.

b. Operate HVAC equipment in an unoccupied mode. Initiate a fire alarm.

c. If provided at the fire alarm control panel, override equipment shutdown.

d. Operate HVAC equipment in unoccupied mode with a call for heating. Initiate a fire alarm.

e. If provided at the fire alarm control panel, override equipment shutdown.

f. Operate HVAC equipment in unoccupied mode with a call for cooling. Initiate a fire alarm.

g. If provided at the fire alarm control panel, override equipment shutdown.

h. For equipment with duct smoke detection, operate in unoccupied mode and cause the duct smoke detector to activate.

i. Repeat conditions of the test with equipment in occupied mode.

5. Acceptance Criteria:

a. Documented completion of prerequisites.

b. For all conditions, HMI accurately reflects status of equipment and positions of devices.

c. Confirm HVAC equipment responds as described in the Contract Documents

D. 2508-IS-04: Non-Pressurized Elevator Hoistway Damper Response to Fire Alarm:

1. [Designer: Review and add to or modify list as necessary based on location design. Coordinate with Division 23, 28.]

2. System/equipment to be tested:

a. Fire smoke dampers.

b. FCS.

c. Fire alarm system.

3. Functions to be tested:

a. Damper response to fire alarm.

4. Conditions of the test:

a. Prerequisites: Completion with acceptable results of Level 1 and Level 2 commissioning activities specified in Section requirements for commissioning of HVAC systems, as stated in the Contract Documents for System/equipment to be tested.

b. Initiate a fire alarm from a random fire or smoke detector.

1) With outside air temperature below 78 degrees Fahrenheit (damper closed).

2) With outside air temperature above 78 degrees Fahrenheit (damper open).

c. Clear the alarm.

5. Acceptance Criteria:

a. Documented completion of prerequisites.

b. Damper: Open under all conditions.

c. Damper: Closed when outside air temperature is below 78 degrees Fahrenheit, else open.

E. 2508-IS-05: Stair and Elevator Pressure Control:

1. [Designer: Review and add to or modify list as necessary based on location design. Coordinate with Division 23, 28.]

2. System/equipment to be tested:

a. FCS.

b. HVAC equipment, including fans and dampers.

c. Fire alarm system.

3. Functions to be tested:

a. Control of excess air pressure differential between passenger platform and stairways and elevator shafts.

b. Fan and damper response to fire alarm and FCS signal.

4. Conditions of the test:

a. Initiate a fire alarm from a random fire or smoke detector.

b. Initiate EVS exhaust mode signal.

c. Initiate EVS supply mode signal.

5. Acceptance Criteria:

a. The system performs as described for the stair pressurization control logic in the mechanical subset.

F. 2508-IS-06: Access Control Response to Fire Alarm:

1. *[Designer: Review and add to or modify list as necessary based on location design. Coordinate with Division 23, 28.]*

2. System/equipment to be tested:

a. Fire alarm control panel (FACP).

b. Overhead coiling doors, roll up grilles, vertical lift gates, and/or egress doors, associated access control devices.

3. Functions to be tested:

a. Overhead coiling doors, roll up grilles, vertical lift gates, and/or egress doors response to FACP incident event.

4. Conditions of the test:

a. With openings in open position, initiate an incident condition signal on FACP.

b. With openings coiling door in closed position, initiate an incident condition signal on FACP.

5. Acceptance Criteria:

a. Overhead coiling doors, roll up grilles, vertical lift gates, and/or egress doors respond to FACP incident according to sequence of operation described in the Contract Documents.

G. 2508-IS-07: External Control and Monitoring Interfaces:

1. *[Designer: Review and add to or modify list as necessary based on location design. Coordinate with other disciplines.]*

2. System/equipment to be tested:

a. FCS I/O connections to external control and monitoring interface terminal strips.

b. [Designer: Review identified systems and add to list or modify as necessary based on location design. Coordinate with other Divisions.]

3. Functions to be tested:

a. External monitoring of FCS points: digital and analog.

b. External control of FCS points: digital.

4. Conditions of the test:

a. FCS outputs to external interface: Verify accuracy of control parameter value represented at the external interface, relative to the value reported at the HMI for the same parameter.

b. External interface inputs to FCS: Verify FCS response to external interface inputs is accurate.

5. Acceptance Criteria:

a. FCS outputs to external interface are accurately represented at the external interface, relative to the value reported at the HMI for the same parameter.

b. FCS response to external interface inputs is accurate.

H. 2508-IS-08: Gas Detection Responses:

1. [Designer: Review and add to or modify list as necessary based on location design. Coordinate with Division 23, 28.]

2. System/equipment to be tested:

a. All gas detection devices used in BMS applications including for carbon monoxide (CO), nitrogen dioxide (NO2), and/or hydrogen (H2) detection.

b. Associated exhaust/ventilation fans and dampers.

3. Functions to be tested:

a. Fan response to schedule.

b. Fan response to gas detection alarms.

c. Fan alternation if applicable.

d. Fan failover if applicable.

4. Conditions of the test:

a. Exceed gas detection alarm setpoints via calibration kits at the detection device or alternate method as detailed in commissioning form procedures

b. Occupied and unoccupied modes.

5. Acceptance Criteria:

a. Fans and dampers respond as intended.

b. Alarms are indicated and logged.

I. 2508-IS-09: Fan/Damper Control Panel (FDCP)

1. *[Designer: Review and add to or modify list as necessary based on location design. Coordinate with Division 23, 26, 28.]*

2. System/equipment to be tested:

   a. FDCP.

   b. Fan Motor Soft Starter.

   c. Ventilation Fan.

   d. Fan Status Monitoring Instrumentation.

   e. Ventilation Dampers.

   f. Damper Motorized Actuators.

   g. Damper Status Monitoring Instrumentation.

3. Functions to be tested:

   a. Damper response to FDCP control devices.

   b. Fan response to FDCP control devices.

   c. Damper response to FDCP control devices.

   d. Damper response to EVS control signals.

   e. Fan and damper FDCP hardwired interlocks.

   f. Fan and damper EVS programmed interlocks.

   g. EVS Response to fan status signals and generation of alarms.

   h. EVS Response to damper status signals and generation of alarms.

4. Conditions of the test:

   a. Fans and dampers energized.

   b. FDCP in “Local” mode.

   c. FDCP in “Remote” mode (EVS Control).

5. Acceptance Criteria:

   a. The FDCP control and indication devices operate as intended.

   b. The fans, dampers, and all hardwired and programmed interlocks operate as intended.

   c. Appropriate alarms are indicated and logged.

J. 2508-IS-10: Pump Station Control:

1. *[Designer: Review and add to or modify list as necessary based on location design. Coordinate with Division 22.]*

2. System/equipment to be tested:

   a. Pump Station controller (PLC).

   b. FCS controller.

3. Functions to be tested:

   a. Correct mapping of PLC I/O points in FCS.

   b. Monitoring PLC inputs by FCS.

4. Conditions of the test:

   a. One by one, alter the values of inputs monitored by the FCS by changing the physical condition of the input sensed by the FCS.

5. Acceptance Criteria:

   a. Sensed condition is reported correctly by FCS.

3.11 LEVEL 1 AND LEVEL 2 TEST REQUIREMENTS MATRIX

[DESIGNER: ADD OR MODIFY MATRIX AS NECESSARY BASED ON TESTS ADDED OR MODIFIED ABOVE DEPENDING UPON THE LOCATION DESIGN FOR FCS]

3.12 LEVEL 3 INTER-STATION SYSTEM INTERFACE TEST REQUIREMENTS

A. Integrated EVS Tests: Provide testing of the integrated EVS system that includes all stations:

1. Provide testing to ensure the EVS response at each new station functions as indicated in the ERM when relevant commands are initiated remotely from any location in the system.

B. Systems Integrated Test: Support the testing program to ensure the correct exchange of signals between this Contract BMS and the SCADA system at LCC (supplied by the Systems contractor):

1. Contract drawings provide details for interface terminals. Coordinate final signal and conductor requirements with equipment.

2. In cases where the FCS or Contractor provided equipment communicates to equipment provided by another contract, through a serial or network interface, proceed as follows:

a. Use the approved System Interface Data Table (SIDT) as Certified Test Reports to test the functionality of signals to and from the interfaced equipment. Initial and date each signal when the signal performs as stated. After signals have been successfully tested, submit the completed tables to the Resident Engineer in a Final Test Report.

b. Each individual piece of interfaced equipment should be included in the SIDT with fields completed as described in the FCS subset drawings. Equipment with these types of interface includes FCS, and potentially fire alarm control panels.

C. System-Wide Integrated Test Support: During the system-wide integrated testing period, provide adequate supervisory mechanical and electrical support personnel to adjust equipment and troubleshoot system failures that might arise. The Link Systems Integration Team conducts system-wide integrated tests with the assistance from Contractor, Construction Management, Operations, and the final design consultant. Systems will be tested together during System-wide Integrated Testing to ensure proper functionality, inter-operability, and reliability of systems necessary for operation.

1. Coordinate with Sound Transit’s Start-Up Manager: The system-wide integrated testing period shall occur before pre-revenue testing.

3.13 LEVEL 3 COORDINATION WITH OTHER CONTRACTORS

A. Provide as-built copies of the SIDT to Sound Transit when required by the Contract. These are necessary for the contractors to design their control system.

B. Continuity Testing: To expedite continuity testing, supply as-built SIDTs within thirty days after all points have been successfully tested and signed-off.

C. Control System Testing: Following the continuity testing, other contractors will verify the functionality of integration of this Contract controls with that of other contracts. The Control System Testing period will last 30 days. This period begins when Systems Integration Testing has been completed.

D. During the Continuity Testing and Control System Testing periods, perform the following:

1. Jointly field test points with the contractors and verify the operation and monitoring of equipment as shown on the Contract Drawings, wiring diagrams, and SIDT.

2. Be present during this testing period with adequate labor and support personnel to adjust equipment and troubleshoot system failures that might arise. When a piece of mechanical or electrical equipment is found to be in conflict with specific criteria, have an experienced representative of the manufacturer make an adjustment to the item. If adjustments fail to correct the operation of a piece of equipment or fixture, remove the equipment or fixture from the Contract site and replace it with a workable replacement that will meet the specification requirements.

3.14 LEVEL 3 AND LEVEL 4 SYSTEM TESTS

A. System Test checklists are required to include the following, at a minimum:

1. 2508-ISIS-01: Central BMS Integration:

a. System / Equipment to be tested:

1) FCS controller to Central BMS servers communication.

2) Additional BMS workstation to Central BMS communication.

3) Central BMS server configuration and functionatlity for additional locations.

4) Central BMS servers are existing. Configuration is updated to include additional locations.

b. Functions to be tested:

1) Screen elements, data logging, alarming, data historian, and trending functions of the Central BMS servers for added locations are available at BMS workstations.

c. Conditions of test:

1) Level 1 and 2 commissioning activities completed.

2) Network communication between FCS controllers and central SCADA servers are operational and perform as expected.

d. Acceptable Results:

1) Screen elements, data logging, alarming, data historian, and trending functions of the Central Cimplicity BMS servers for added locations are available at BMS workstations and are functioning correctly.

2. 2508-ISIS-02: Central EPMS Integration:

a. System / Equipment to be tested:

1) Submeter to Central WinPM.Net server communication.

2) Central EPMS server configuration and functionality for additional submeters.

3) Central EPMS server is existing. Configuration is updated to include additional submeters.

b. Functions to be tested:

1) Screen elements, data logging, alarming, data historian, and trending functions of the Central EPMS server for additional submeters.

c. Conditions of test:

1) Level 1 commissioning activities for submeters is completed.

2) Communication between submeters and the Central EPMS server are operational and perform as expected.

d. Acceptable Results:

1) Screen elements, data logging, alarming, data historian, and trending functions of the Central EPMS server for additional submeters are functioning correctly.

3.15 LEVEL 3 AND LEVEL 4 TEST REQUIREMENTS MATRIX

	2508-ISIS-0X
Central BMS Integration	X
Central EPMS Integration	X

[DESIGNER: ADD OR MODIFY MATRIX AS NECESSARY BASED ON TESTS ADDED OR MODIFIED ABOVE DEPENDING UPON THE LOCATION DESIGN FOR BMS]

EXHIBITS

1. **Exhibit A: Example Test Procedure** (On Proceeding Pages)

EXHIBIT A

EXAMPLE TEST PROCEDURE

3.16 TEST INFORMATION

Test ID:	*2508-S-01 FCS Operator Interface*
Date Time and Location:	
First Test, Repeat Test or Demonstration:	
Equipment IDs:	

3.17 OBJECTIVES

A. Verify performance of BMS Operator Interface (HMI)

B. Reference appropriate specification section.

3.18 SYSTEMS AND EQUIPMENT TO BE TESTED

A. Access to all station equipment and systems on BMS via the BMS log-in screen; will utilize the programming and control commands, control software programming languages, and graphical representations.

3.19 PREREQUISITES

A. BMS equipment communicates successfully over network	Y___N___
B. BMS equipment has passed Start-Up test	Y___N___
C. System alarm log captured prior to testing	Y___N___

3.20 MINIMUM PARTICIPANTS

A. Test Technician

B. Owner's Witness

3.21 TEST PROCEDURE

A. In accordance with general conditions of the contract, contractor shall be responsible for initiating, maintaining, and supervising all safety precautions and programs in connection with the performance of this test. Stop the test and notify the owner if it is determined that any part of the test cannot be performed safely.

B. Perform and document the following steps in the order listed. Acceptance criteria are listed below each step.

C.	To verify proper functionality of the BMS operator interface, demonstrate the following on the BMS HMI:		
	1.	Operator selected display of input/output data in tabular or graphic format.	PASS___ FAIL___
	2.	Equipment dynamic graphics	PASS___ FAIL___
	3.	System dynamic graphics	PASS___ FAIL___
	4.	Equipment status	PASS___ FAIL___
	5.	Equipment commands including start/stop, open/close	PASS___ FAIL___
	6.	Analog input values read expected values correctly	PASS___ FAIL___
	7.	Analog output values read expected values correctly	PASS___ FAIL___
	8.	Digital input values read expected values correctly	PASS___ FAIL___
	9.	Digital output values read expected values correctly	PASS___ FAIL___
	10.	Networked input values read expected values correctly	PASS___ FAIL___
	11.	Networked output values read expected values correctly	PASS___ FAIL___
	12.	Logs and reports functional	PASS___ FAIL___
	13.	Analog setpoint changes demonstrated	PASS___ FAIL___
	14.	Ability to add, delete, modify points demonstrated	PASS___ FAIL___
	15.	Ability to modify point descriptions, status, alarms and engineering units demonstrated	PASS___ FAIL___
	16.	Ability to develop, modify, delete or display full range of color graphic displays	PASS___ FAIL___
	17.	Automatically archive select data while running third party software	PASS___ FAIL___

18.	Capability to sort and extract data from archived files and generate custom reports	PASS___ FAIL___
19.	Operator selectable output of screen graphical images, data trend logs, and alarm summary information	PASS___ FAIL___
20.	Automatic time and date stamped output of all system alarms and automatic or manual control system actions	PASS___ FAIL___
21.	Machine date and time settings accurate	PASS___ FAIL___
22.	Demonstrate ability to export HMI point configurations to .csv or other acceptable file format	PASS___ FAIL___
23.	Ability to start/stop HMI program demonstrated, printed instructions are posted near installation	PASS___ FAIL___
24.	Ability to override point values and other parameters demonstrated	PASS___ FAIL___

3.22 ACCEPTANCE CRITERIA

A. Observed results shall comply with acceptance criteria in the procedure above.

3.23 TEST RESULTS

A. Record test conditions and results on the Test Procedure in the spaces provided above at the time of the test. Record results legibly in ink.

3.24 OBSERVATIONS NOTED OR CORRECTIVE ACTIONS REQUIRED

#	Description	Resolution	Retest Req'd
			Y___N___
			Y___N___

3.25 SIGNATURES

A. The undersigned have witnessed the above test and verified that the test was performed in accordance with the Approved Commissioning Test Procedure and that the results recorded were the actual results observed.

SECTION 25 50 00

INTEGRATED AUTOMATION FACILITY CONTROLS

PART 1 - GENERAL

1.01 SUMMARY

A. This Section includes:

1. Requirements for the building management system (BMS) equipment for garages and support facilities. BMS equipment includes ventilation, electrical, communications system (by systems contract) and mechanical system components, including control components for units that are not supplied with factory-wired controls. Items to be furnished include control equipment and software programming as well as communications and data transmission equipment and related software programming.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. American National Standards Institute (ANSI):

a. ANSI T1.329 Network Equipment - Earthquake Resistance.

2. Institute of Electrical and Electronics Engineers (IEEE):

a. IEEE C37.90.1 Surge Withstand Capability (SWC) Tests for Relays and Relay Systems Associated with Electric Power Apparatus.

b. IEEE C62.41.1 Guide on the Surge Environment in Low-Voltage (1000 V and Less) AC Power Circuits.

3. National Electrical Manufacturers Association (NEMA):

a. NEMA IA 2.3 Programmable Controllers Part 3: Programming Languages.

b. NEMA ICS 1 Industrial Control and Systems General Requirements.

c. NEMA ICS 1.1 Safety Guidelines for the Application, Installation, and Maintenance of Solid State Control.

d. NEMA ICS 2 Controllers, Contactors and Overload Relays Rated 600 Volts.

e. NEMA ICS 4 Application Guide for Terminal Blocks.

f. NEMA ICS 6 Enclosures.

4. National Fire Protection Agency (NFPA):

a. NFPA 70 National Electrical Code

b. NFPA 72 National Fire Alarm and Signaling Code.

c. NFPA 130 Standard for Fixed Guideway Transit and Passenger Rail Systems.

5. Underwriters Laboratory (UL):

a. UL 50 Standard for Safety Enclosures for Electrical Equipment, Non-Environmental Considerations.

b. UL 508A Standard for Safety of Industrial Control Panels.

c. UL 60947-4-1 Standard for Safety Low-Voltage Switchgear and Controlgear – Part 4-1: Contractors and Motor-Starters – Electromechanical Contractors and Motor-Starters.

d. UL 60947-5-1 Standard for Safety Low-Voltage Switchgear and Controlgear – Part 5-1: Control Circuit Devices and Switching Elements - Electromechanical Control Circuit Devices.

6. Military Specification (MIL):

a. MIL-STD 1472G – Human Engineering.

7. Telcordia:

a. GR-63-CORE NEBS Requirements: Physical Protection for Fiber Distributing Frames.

1.03 SUBMITTALS

A. Reference Submittal Procedures as stated in the Contract Documents.

B. Submit:

1. Equipment Integration Plan. Provide a plan that includes allowances for regular status review meetings with Sound Transit representatives during factory testing, installation and commissioning to ensure interoperability with existing and future systems. Include a description for how:

a. The designs are integrated within this scope of work, including identifying coordination meetings with appropriate sub-contractors, such as Mechanical, Fire alarm, Access Control, and Electrical.

b. The design and installation are integrated with the existing Sound Transit Tridium Niagara Framework infrastructure.

c. How work and submittals will be sequenced with the Systems Contractor to ensure integration.

2. Submit the items described below:

a. Shop Drawings containing the following information for each BMS control panel and enclosure:

1) Include the product data for each type of product specified within the Shop Drawing submittal. Include manufacturer's technical Product Data for each BMS system component furnished, indicating dimensions, capacities, performance characteristics, electrical characteristics, finishes of materials, installation instructions, and startup.

2) Hardware and software bill of materials.

3) Drawing List.

4) Equipment assembly details, including components and indicating dimensions, weights, loadings, required clearances, method of field assembly, and location and characteristics of each field connection.

5) Listing of connected data points, including connected control units and input devices. See BMS drawing subset for a list of I/O points. The Contractor shall confirm all points required to perform control logic is included in the list and if not add required I/O to be able to perform the logic.

6) Each control device labeled with setting or adjustable range of control.

7) Diagrams for all required interconnecting wiring. Clearly differentiate between factory-installed and field-installed wiring.

8) Each conductor labeled utilizing identifying labels.

9) Manufacturer's general and detail arrangement drawings for switches and enclosures.

10) Provide all dimensions including enclosure.

11) System configuration showing I/O and peripheral devices, power supplies, diagrams, and interconnections.

12) Details of interface terminal cabinets (ITC), control panel and enclosure faces, including controls, instruments, and labeling.

13) Each I/O point labeled utilizing unique identifying labels. Use indicated labels where shown on the Plans.

14) Wiring diagrams detailing wiring for power, signal, and communications systems and differentiating clearly between manufacturer-installed and field-installed wiring.

15) Schematic flow diagram showing HVAC, dampers, and other control devices served.

b. Human Machine Interface (HMI) system graphics indicating monitored systems and devices, data (connected and calculated) point addresses, and operator notations. A representative sample of full scale, full color HMI prototypes of each type of screen shot in both hard copy and soft copy format:

1) Process screens.

2) Process and alarms screens.

3) Diagnostic and status screens.

4) Trending and logging screens.

a) Data shall be recorded continuously with a minimum of two years available for trend displays.

b) Coordinate method for data storage with Sound Transit.

5) HMI description, including.

6) Narrative overview of HMI describing navigation between categories and views, including popups:

a) Description of equipment status display and alarm visibility convention.

b) Written sequence of operation for each category providing logic and control, including set points. For I/O be passed through or monitored only, provide an explanation of screens and status indications.

c. Control programs, fully annotated to describe the function of each programming element and each functional segment.

d. IP Address List for all contractor-provided BMS devices connected on a network:

1) Develop and assign unique addresses based on Sound Transit guidance.

e. Monitored/Controlled equipment list.

3. Testing, Commissioning, and Training Plans:

a. Factory Testing:

1) Submit a factory test plan and test procedure. This correlates to BMS Factory Tests and Inspection commissioning activities as stated in the Contract Documents.

b. Commissioning:

1) Reference General Commissioning Requirements specification stated in the Contract Documents.

2) Support the project's Testing and Commissioning Manager with the planning and execution of tasks involving Division 25 components.

3) Plans for a factory test must be submitted and approved prior to scheduled factory acceptance test activities. This procedure shall include detailed procedures and forms for performing Factory Acceptance Tests necessary to verify the performance of all active components in the BMS.

c. Training:

1) Reference Training specification stated in the Contract Documents.

2) Submit a plan and course materials in digital format to be used for BMS training, tailored to the following departments:

a) Operations.

b) Maintenance.

c) Engineering.

4. Points List:

a. The Contractor is required to submit the Points List 6 months prior to FAT. The Points List must be approved before start of FAT.

b. At a minimum, the Points List shall include point tag ID, point description, point address, digital point state attributes, analog alarm set point information analog range, engineering units, meaningful alarm state description (i.e. all causes for a TROUBLE alarm), and analog alarm attributes:

1) Points List:

a) Comprehensive list of field controller I/O point interfaces that includes both the field side points interfaced to monitored/controlled equipment, and on the HMI side for points developed in field controller logic interfaced through the OPC servers.

b) Include the following columns for descriptive fields for each point:

i) Unique point ID (typically the HMI tagname.

ii) Location: Descriptive name of the garage name, or other location where the point originates.

iii) Equipment: ID of the equipment or device associated with the point.

iv) Field Controller: ID of field controller where the point is read/written.

c) Address of the point in Field Controller memory.

d) Subsystem: BMS.

e) Point Description: Meaningful description for the point. The description should go from general to specific so that alphabetical sorting of the spreadsheet will group points relating to the same device together.

f) Point Type:

i) AI (analog input).

ii) AO (analog output).

iii) DI (discrete input).

iv) DO (discrete output).

v) LAI (logical analog input from field controller to HMI).

vi) LAO (logical analog output to field controller from HMI).

vii) LDI (logical discrete input from field controller to HMI).

viii) LDO (logical discrete output to field controller from HMI).

g) State: For discrete points, a description of the on and off states in the form “On Description/Off Description”. For analog points, enter “NA”.

h) EU: For analog points, the range and units of the scaled point, for example: “0-10 psi”.

i) Alarm: For discrete inputs enter On/Off/None for the active alarm state. For analog inputs enter value.

j) For analog points, enter alarm limit range set points:

i) High-High.

ii) High.

iii) Low.

iv) Low-Low.

k) Indicate whether point is logged in the historical database. Logging of the following points are required, at minimum:

i) All analog points.

ii) All alarms.

iii) All discrete inputs.

5. Closeout Submittals:

a. Contract Records: Record actual locations of control components, including all field components and sensors. Revise Shop Drawings to reflect actual installation and operating sequences. Include all data specified in "Submittals" in final "Record Documents" form.

b. Provide Operation and Maintenance Manuals:

1) Furnish an operation and maintenance manual for each piece of equipment, unless otherwise specified herein. The manual shall be loose leaf bound and shall include, but not necessarily be limited to, the following information:

a) Operating instructions.

b) Troubleshooting and fault isolation procedures for on- site level repair.

c) Equipment replacement procedures.

d) Disassembly and reassembly instructions.

e) A list of the components that are replaceable at the three possible levels of maintenance: on site, department shop, and the manufacturer's facility.

f) A test procedure to verify the adequacy of repair work.

g) A preventive maintenance schedule and instructions for the replacement of any electrical equipment, e.g., I/O cards, software, controller cards, etc.

h) A preventive maintenance schedule for inspection, removal, and replacement for each component.

i) A list of special tools provided by the manufacturer.

j) A list of recommended tools and test equipment required to perform all maintenance tasks.

k) Recommended spare parts list for one year's operation.

l) Interchangeable parts list showing parts common to items of equipment.

m) Equipment manufacturer's' descriptive literature including catalog cuts.

n) Record drawings.

o) The latest service bulletins, with issue dates, that describe service procedures.

p) The software source programs as well as trouble shooting, fault diagnostics, and shutdown procedures.

q) Computer software: Hard and electronic copies of the processor application source code, data table allocations, and descriptions of main software modules.

r) Training materials for BMS system operation and maintenance training sessions as specified herein.

6. Spare Parts: Furnish spare parts in accordance with Article 3.08.

C. Contractor shall submit a pre- final printout of all code and logic following Factory Testing. The code shall be thoroughly documented to clearly explain each rung and block of code or logic.

D. Contractor shall submit a final printout and electronic version of all logic for project closeout. The code shall be thoroughly documented to clearly explain the logic and code.

E. Transmit the following:

1. System Integrators Qualifications. Provide a printed certified qualification resume of the contractor or systems integrator performing the fabrication, configuration, and programming of the BMS components no later than 120 days after NTP

1.04 QUALITY ASSURANCE

A. Manufacturer Qualifications:

1. BMS hardware must be sourced from a limited number of manufacturers to ensure optimal operation and maintenance support. All manufacturers must have a proven track record in manufacturing components with the required capabilities and a successful operational history of at least five years.

2. The programmable controller manufacturer or the manufacturer's approved system integrator shall maintain a national network.

3. To facilitate future support, purchase BMS Controller and remote I/O hardware from a vendor within 150 miles of the Project. Available support within 150 miles of the Project shall include start-up service, emergency service calls, repair work, service contracts, maintenance, and training of personnel.

4. Provide a listing of at least five projects of similar magnitude, complexity and facility use type completed within the past five years.

B. Integrator Qualifications:

1. The contractor or integrator shall have a minimum of 5 years' experience related to design, fabrication, programming, installation, start-up, and testing of similar control systems.

2. If more than one Contractor or systems integrator is employed, submit a certified resume for each one indicating their specific specialty and item of work.

3. Demonstration of technical competency with BMS system manufacturers is required through relevant certifications or reference letters from manufacturers/vendors, or hands-on demonstration if requested by the Resident Engineer.

C. Commissioning/Startup Personnel Qualifications: Where necessary, engage specially trained personnel in direct employ of manufacturer of BMS control system components.

1.05 FACTORY TESTS AND INSPECTIONS

A. General:

1. The following specifies the testing requirements for the processor equipment and HMI to be procured under this Contract. All tests described herein shall not preclude any additional standard tests normally performed by the manufacturers for similar equipment or requested by the Resident Engineer to verify performance.

a. Transmit notice of scheduled factory test dates prior to proposed testing date(s). The notification shall include the expected duration and sequence of testing. Observations made during the tests, and test results shall be recorded in a document form acceptable to the Resident Engineer, certified by Contractor and submitted to the Resident Engineer for record before shipping equipment to site. All expenses in connection with or incidental to the testing shall be borne by Contractor excluding Resident Engineer travel expenses.

b. The test procedure specified shall be sequential in the order prescribed. HMI, processor, communications equipment, or any components, which failed to perform as specified, shall be subject to retest at no addition cost to the Agency.

c. All Factory Testing is to be complete prior to commissioning of the system.

B. HMI, Programmable Automation Controller (processor) and Remote I/O System:

1. Arrange for factory testing of HMI, processor, and remote I/O system. Tests shall be witnessed unless otherwise determined by the Engineer.

2. Witnessed Tests shall be tested for operation, sequencing, inter-locking, communications, diagnostics, fault conditions, data logging and alarming functions as outlined in this Specification and the Drawings. All field functions shall be simulated in the factory for the purpose of this test. Witnessed testing activities shall include:

   a. Network ping testing.

   b. Network configuration verification, including switch and host addressing, redundant media, and switch failure response.

   c. Panel and PLC power supply fault response.

   d. Simulated field equipment interface for the following:

      1) AHUs and ACUs normal and fire response.

      2) Fan Coil Unit response.

      3) Supply and exhaust fans normal and fire response.

      4) Motorized and solenoid actuated dampers and smoke dampers, normal and fire response.

      5) FACP.

      6) Hydrogen alarm.

      7) Clean agent alarm.

      8) Lighting controllers.

      9) Sump pump controllers.

      10) Temperature sensors.

      11) Temperature or pressure control loops performed by BMS.

      12) Heating equipment.

   e. Unwitnessed factory tests and checks shall include:

      1) Check of control and power wiring insulation resistance and freedom from shorts and grounds.

3. Input/Output Points Validation Testing:

   a. Prepare test forms for all points in the accepted Points List.

   b. Add validated column to spreadsheet for witness initials and witnessed date of successful demonstration of the point.

   c. Demonstrate correct manipulation of I/O and related functionality to Sound Transit representative in the field.

d. Demonstrate points through actual operation of equipment or demonstration or by simulation if accepted by the Resident Engineer

e. For testing convenience provide tables of the real and logical points in the HMI to easily verify the actual state of each point.

1.06 FIELD MEASUREMENTS

A. Verify field conditions, measurements, and clearances prior to fabrication and installation of BMS system components.

1.07 MAINTENANCE SERVICE

A. There shall be BMS integration support personnel on-call through the below periods.

1. Pre-revenue testing period:

a. Following installation, testing and commissioning, Sound Transit plans to operate the system in a pre-revenue testing mode to understand equipment performance, traction power, train control and related system components.

b. During this phase, the Contractor shall provide on-site technical advisors to assure continued operation of the BMS.

2. After Final Acceptance:

a. Provide support for hardware and software for a year after Final Acceptance.

b. Upon completion of a year of maintenance support system administration right shall transfer solely to Sound Transit.

c. Provide original source code to an escrow account at this time. Sound Transit will take possession of the source code in the account and unrestricted license to it if either the Contractor goes out of business or if the Contractor no longer supports the product(s) directly associated with the source code.

d. Contractor support shall respond to a problem report within 4 hours during normal business hours defined here as 9:00 a.m. to 5:00 p.m. Monday through Friday, Pacific time, and shall respond to a problem within 8 hours at all other times.

3. The programmable controller manufacturer or the manufacturer's approved system integrator shall maintain as part of a national network, engineering service facilities within 150 miles of the project site, to provide start-up service, emergency service calls, repair work, service contracts, maintenance, and training of personnel. Emergency service shall be available within 24 hours of notification. During revenue service operations, the PLC manufacturer shall provide on call support.

B. POWER LINE PROTECTION AND SIZING

1. Equipment connected to ac circuits shall be protected from power-line surges. Equipment protection shall meet the requirements of IEEE C62.41. Fuses shall not be used for surge protection.

2. AC input power loads for the BMS panels, cabinets, and racks connected to the AC distribution system shall be submitted so that upstream distribution overcurrent protection and UPS capacity can be evaluated prior to approval of submittals and BMS panel fabrication.

1.08 DELIVERY, STORAGE AND HANDLING

A. Store equipment and materials inside and protected from weather and other hazards.

PART 2 - PRODUCTS

2.01 SYSTEM DESCRIPTION

A. The BMS control processing equipment shall be comprised of:

1. Controllers including control processors, Ethernet IP modules, Lonworks, and RS485 communication modules.

2. I/O hardware and wiring, including all modules necessary for interface with field devices and controllers.

3. A summary processor warning alarm for all detectable, non-fatal faults in the controller chassis or I/O chassis.

4. A summary processor fail alarm for major faults including failure of a processor.

5. Appropriate analog and discrete I/O processing modules for monitoring and control of garage electrical, mechanical, vertical circulation, communications system (by systems contractor), and garage plumbing systems and equipment.

B. Provide a BMS HMI, equipment, software, and functional programming:

1. The BMS HMIs shall be rack mounted, slide out laptops, and shall allow Operator access to all indicated garage and support facility equipment and systems via the same log-in screen. It shall allow access to programming and control commands, control software programming languages, and graphical representations. Develop dynamic control and monitoring displays representing garage electrical, garage mechanical, vertical circulation, and garage plumbing systems and equipment.

2. Reference EXHIBITS for the display symbols, colors, and layouts that shall be followed to ensure that the HMI graphics provided by the Contractor conform to that at other garages in the system.

3. Contractor shall assume the level of detail, color, symbols and other display attributes shall be similar or the same as the examples in the EXHIBITS.

4. A prototype of the displays shall be developed in close coordination with Sound Transit's operations and engineering staff. This coordination will require reiterative modifications to the display. The Contractor shall assume this iterative process. The final version of the prototype shall be submitted to Sound Transit for approval. Operator access to the BMS, for the purpose of system manipulation, shall not be designed or implemented to occur from any device other than the dedicated HMI's.

5. The HMI's shall be connected to the BMS system via a Contractor provided IP local area network (LAN). This HMI will serve as the operator interface for the Contractor provided equipment and for the Systems contractor provided equipment. The I/O for this equipment shall be as indicated in the BMS subset contract drawings.

C. Provide Remote I/O (RIO) compatible with the BMS control processing equipment.

D. Provide fiber optic and copper cable communication equipment and transmission media, as well as required communication programming to transmit, at each location shown on the

Contract Drawings. See communications horizontal cabling as stated in the Contract Documents for BMS cable and conductor requirements.

E. Provide control equipment and associated software programming at each location shown on the Contract Drawings:

1. Coordinate software programming with existing sites.

2. Coordinate software programming with Security Operations Center (SOC):

a. Alarm and Event information.

3. Provide Historical Collection of point data.

a. Record 2 years of data.

b. Coordinate method for data storage with Sound Transit IT.

F. Provide non-proprietary, open standard, communications network for the use of the BMS system as indicated.

G. The BMS system shall provide overall system response time meeting the following requirements:

1. Binary point change of value connected to DDC system should be updated and displayed at least every 10 seconds for use by operator.

2. Analog point change of value connected to DDC system should be updated and displayed at least every 10 seconsds for use by operator.

3. Digital output commands entered at the HMI shall start execution in the field within a maximum of 2 seconds following command execution at the HMI.

H. Include installation and calibration, supervision, adjustments, and fine-tuning necessary for complete and fully operational system.

I. The complete system shall be designed for operation under the following environmental conditions. Where the installed location cannot provide the environment required, Contractor shall provide appropriate heat sinks and air tight enclosure to protect the system:

1. Ambient temperature: 0 degrees to 60 degrees Celsius.

2. Relative humidity: 5 percent to 95 percent.

3. Equipment not installed in the garage communications room shall be able to withstand the environmental extremes from operating in these spaces. All such equipment in these enclosures shall have an operating temperature between -10 degrees to 140 degrees Fahrenheit.

J. The Contractor shall have the following additional responsibilities under the scope of this contract:

1. Provide submittal and/or record documentation.

2. The Contractor shall be directly responsible for the coordination and integration of the BMS with motor controls, packaged equipment controls, instrumentation, and other related equipment. The Contractor shall be responsible to obtain submittal information on the equipment specified or provided by other suppliers or disciplines. The Contractor shall communicate directly with the manufacturers and suppliers of

all related equipment to determine all details of the equipment that may influence or affect the control system. The Contractor shall determine all requirements for and shall integrate all the equipment of the BMS into a unified and operational system as outlined in the Contract Documents.

3. Provide specified Sound Transit personnel training.

4. Participate in specified commissioning process of related equipment:

   a. FACP (Fire Alarm Control Panel).

   b. HVAC (Heating Ventilation Air Conditioning).

   c. Electrical System.

5. Perform all system start-up and commissioning procedures as required and described by this Section.

6. Respond to project punch list and correct any system deficiencies.

2.02 MANUFACTURERS

A. Manufacturers:

1. Server-based software supervisory control:

   a. Hardware:

      1) If using software-based supervisory control, gather server hardware requirements through the request for information process.

   b. Software:

      1) FX Server 14, FX Workbench.

      2) Tridium Vykon SoftJACE.

      3) Approved equal.

2. Supervisory controllers:

   a. Johnson Controls (JCI):

      1) FX80 JACE controller.

   b. Compatibility with BACnet MS/TP, BACnet IP, LonWorks and Modbus TCP/IP protocols.

   c. Provide accessories as required to support network communication between devices.

   d. Provide all licenses and drivers required to implement a remote, web-based interface.

   e. Approved equal.

3. Equipment controllers:

   a. JCI:

1) CG and CV series devices.

2) FAC and FEC series devices.

b. Must be compatible and integrated with provided supervisory controller(s).

c. Approved equal.

4. Remote I/O:

a. JCI:

1) M4-XPM series devices.

2) MS-IOM series devices.

b. Must be compatible and integrated with provided equipment controller(s).

c. Approved equal.

5. Communications Protocol Gateways:

a. Contemporary Controls BASrouter.

b. KMC Controls BACnet Router.

c. ProSoft / Sierra Monitor / MSA QuickServer.

d. Red Lion Data Station Plus model DSP.

e. Approved equal.

6. Approved Equal Fiber Optic Communications Equipment:

a. Phoenix Digital.

b. Approved Equal.

7. Ethernet Switching Equipment:

a. Switches are provided and configured by Sound Transit.

b. Provide mounting space, hardware, power supply, and communications cable connections for all switches installed in BMS control panels, racks, and cabinets. Ensure physical, electrical, and connection details are coordinated within Sound Transit using the Ethernet switch list submittal.

8. HMI Application Software:

a. Niagara 4.

b. Approved Equal.

9. Enclosure and Panels Seismic rated:

a. Chatsworth.

b. Hoffman/Pentair.

c. Saginaw Control & Engineering.

d. Approved equal.

10. Conduit Raceway:

a. Carlon.

b. Approved equal.

11. Fiber Distribution Panel:

a. Corning LANscape.

b. Telect LCX.

c. Approved equal.

12. Ethernet Patch Panel:

a. Leviton.

b. Approved equal.

2.03 SYSTEM CONTROL EQUIPMENT DESCRIPTION

A. Provide power from the communications room ac system to power all BMS electronic equipment, i.e. – Controllers, RIO, IP switch, power supplies, etc. prior to the Systems Contractor installing the UPS:

1. The systems contractor will provide a UPS in the communication room as part of a follow on contract.

2. Provide a temporary bypass of the Systems provided UPS to power the BMS for testing.

3. The temporary bypass shall be installed in such a way that facilitates easy removal by the Systems contractor to install the UPS bypass and the UPS system.

4. A submittal shall be provided showing this temporary power layout. This submittal shall include BMS power loads for UPS sizing.

B. BMS equipment environmental operating parameters:

1. Temperature:

a. Equipment not in a communication room: minus 10 to 140 degrees Fahrenheit ambient.

b. Equipment in communications room; 50 degrees Fahrenheit to 95 degrees Fahrenheit.

2. Relative humidity: 5 to 95 percent relative humidity.

3. Atmospheric pressure: 795 to 1080 kPa.

C. HMI:

1. Gather software/hardware requirements for local HMI through the request for information process.

2. Specified to operate in the environment where it will reside.

D. Control Units:

1. See hardware specifications for equipment controllers.

2. Modular, comprising a microprocessor-based central processor unit module with programmable, nonvolatile, random-access memory; power supply modules; input/output communications network processing modules, and system communications modules.

3. Units monitor or control each input/output point; process information; execute commands from operator terminals or SOC operators; and download data from or upload data to HMI units.

4. Control Units shall be equipped with web server capability to provide control and status information to web-browser-based applications.

5. Control functions operate, regardless of system communications network status, over star connected fiber optic I/O network communication links. Functions include the following:

a. Discrete/digital and analog.

b. Monitoring, controlling, or addressing data points.

6. Each BMS control enclosure and control panel shall be provided with an Ethernet-based data communication port for operator I/O devices such as industry standard portable operator’s terminals or portable lap-top computers.

7. Each BMS control panel shall continuously perform self-diagnostics, communication diagnosis and diagnosis of all subsidiary equipment. Information concerning detected diagnostic faults shall be broadcast network-wide via the I/O network.

8. All necessary software to form a complete operating system as described in this specification shall be provided. Applicable software programs shall be provided as an integral part of each BMS panel and shall not be dependent upon any higher-level computer for execution.

9. Sensor and Control Wiring Surge Protection: Controllers shall have sensor and control wiring surge protection with optical isolation, metal oxide varistors (MOV), or silicon avalanche devices. Fuses are not permitted for surge protection.

E. BMS System Communications Network (LAN):

1. Ethernet/IP communications protocols that support communications at 1000Base-LX.

2. Provide at each BMS cabinet.

3. Enough ports for BMS plus Systems provided equipment that requires Ethernet connectivity plus 25 percent spare ports.

4. Communication via single mode fiber optic cables.

5. IP Addressing:

a. Any IP addressing that is required for equipment being installed under the contract that is not addressed by the specification will require an RFI and subsequent approval by Sound Transit before being used. Submit RFI three months in advance of implementation.

6. The network shall be time synched to Sound Transit's TCN domain.

F. Software:

1. With approval from Sound Transit, update to latest versions of software at project completion. Include and implement the following capabilities:

a. Software shall be developed to provide the control units with the functionality specified herein and on the Plans.

1) Control logic for HVAC as described in the mechanical subset.

2) Manual (operator initiated) selection and control of individual electrical, systems, HVAC, plumbing, and mechanical system components.

3) Monitoring and controlling of indicated field equipment and devices.

2. Software shall be developed to provide the HMI unit with the functionality specified herein and on the Plans:

a. Input/output Capability:

1) Request display of current values or status in tabular or graphic format.

2) Command selected equipment to specified state.

3) Initiate logs and reports.

4) Change analog limits.

5) Add, delete, or change points within each control unit or application routine.

6) Change point input/output descriptors, status, alarm descriptors, and engineering unit descriptors.

7) Add new control units to system.

8) Modify and set up maintenance scheduling parameters.

9) Develop color graphic displays based on MIL-STD 1472G.

10) Automatically archive select data even when running third party software.

11) Provide capability to sort and extract data from archived files and to generate custom reports.

12) Support alarm/data printer operations.

13) Operator selectable output of screen graphical images, data trend logs, and/or alarm summary information to printer.

14) Automatic time and date stamped output of all system alarms and automatic or manual control system actions to printer.

15) Select daily, weekly or monthly as scheduled frequency to synchronize time and date. Accommodate daylight savings time adjustments.

b. Dynamic Color Graphic Displays:

1) Utilize symbols based on MIL-STD 1472G.

2) The system shall provide dynamic graphic data.

a) Limit output of real-time live dynamic data per graphic screen to 60 objects.

3) Up to 1,000 separate graphic pages.

c. Graphic screens to be developed in conjunction with Sound Transit staff include but are not limited to:

1) Graphic screens will match existing facilities and adhere to BMS graphic standards. Refer to EXHIBITS for standards utilizing available symbols, and libraries.

2) Overviews of each electrical, plumbing, or mechanical system, providing means to quickly select specific graphics and indicating system-wide operating parameters and alarms.

3) Graphical representation of ventilation equipment configuration at each specific garage location, indicating status of each ventilation system component.

4) For each system, provide screens showing user- configurable historical data trend logging of equipment status and monitored signal values.

5) System-wide alarm summary screen indicating date, time, and nature of alarm event and providing the means to quickly select the graphical representation screen pertaining to the affected equipment or system.

6) Communications network overview screens indicating status and diagnostic information generated by the system communications and I/O communications network sub-systems.

d. Operator System Access: Via software password with minimum 10 access levels at HMI.

e. Data Base Creation and Support: Changes shall utilize standard procedures. Control unit shall automatically check workstation data base files upon connection and verify data base match. The listing shown in the drawings should be assumed to be 95 percent complete with additions or modifications to the final I/O list coordinated with the installation contractor, procured equipment, and Sound Transit. Sound Transit, at its sole discretion, may add or delete points. The Contractor shall coordinate with Sound Transit during its preliminary design to finalize the points list. The Contractor shall assume this coordination, providing additional I/O modules if required, and providing Controller or Remote I/O configuration of the revised points.

f. Minimum capability shall include:

1) Add and delete points.

2) Modify any point parameter.

3) Change, add, or delete English language descriptors.

4) Add, modify, or delete alarm limits.

5) Add, modify, or delete points in start/stop programs, trend logs, etc.

6) Create custom relationship between points.

7) Create or modify BMS loops and parameters.

8) Create or modify override parameters.

9) Add, modify, and delete any applications program.

10) Add, delete, develop, or modify dynamic color graphic displays.

g. Alarm Processing:

1) Abnormal condition: Cause alarm and appropriate message, including time, system, point descriptor, and alarm condition.

2) Critical alarm or change-of-state: Display message, stored on disk for review and sort, or print.

3) Display alarm reports on video. Display multiple alarms in order of occurrence.

4) Define time delay for equipment start-up or shutdown.

5) Allow unique routing of specific alarms.

6) Operator selectable configuration specifies if alarm requires acknowledgment.

2.04 CONTROL PANELS

A. Continue to indicate unacknowledged alarms after return to normal.

B. Alarm notification:

C. Display indicating alarm condition.

D. Selectable audible alarm indication.

E. All BMS system alarms shall be available from web-based graphics. Contractor shall coordinate closely with Sound Transit during BMS programming to provide this functionality:

1. Communication Room Equipment Rack:

a. Racks shall be Chatsworth Products (CPI) Seismic Frame cabinet series, or approved equal.

b. Rack shall be rated Zone 3 compliant to Bellcore GR-63-CORE for Network Equipment Building Systems (NEBS).

c. Frame: Welded steel.

d. Rack Framework: 11 gauge ASTM A570 steel.

e. Size: Sized for standard 19-inch equipment widths. 84 inch H (43 rack units), 36 inch usable depth, 27.32 inch width.

f. Paint: ANSI 61 gray and resistant to corrosion.

g. Mounting Rails: Standard EIA-310 hole pattern with pre-tapped holes.

h. Ventilation: Louvered top panel and fan to provide air flow of 400 CFM minimum.

i. Paneling: Enclosed with side panels.

j. Doors: Hinged, swing open, and removable doors.

k. Design racks to accept 120 Vac single phase service.

l. Mounting Equipment:

1) Expansion Anchors: Hilti Model HSLB M12-25 or approved equal.

2) Cabinet isolation barrier, non-conductive phenolic resin.

2. BMS Cabinet:

a. Single door, enclosure rated NEMA Type 4X for locations not in a room or closet. Provide NEMA 12 for all other locations.

b. Enclosures shall, as a minimum, be constructed of 16 gauge steel with all seams continuously welded and smoothly finished, and shall possess integral, rolled lip framing around the door to prevent dirt, water, and other debris from falling into the cabinet when the door is opened.

c. Enclosure door shall be fully gasketed with glued-in-place oil resistant gaskets and shall be equipped with a screwed-down door clamp mechanism and pad lockable hasp assembly.

d. Exterior finish shall be cabinet manufacture's standard corrosion inhibiting, baked-on enamel finish over phosphatized surfaces.

e. The enclosure interior surfaces and back panels shall be finished with the cabinet manufacturer's standard corrosion-inhibiting, white high-gloss baked-on enamel finish.

F. Interface Terminal Cabinets (ITCs):

1. Provide wall-mounted, single door, enclosures rated NEMA Type 4X where not in a room or closet and NEMA 12 for all other locations.

2. Enclosures shall, as a minimum, be constructed of 16 gauge steel with all seams continuously welded and smoothly finished, and shall possess integral, rolled lip framing around the door to prevent dirt, water, and other debris from falling into the cabinet when the door is opened.

3. Enclosure door shall be fully gasketed with glued-in-place oil resistant gaskets and shall be equipped with a screwed-down door clamp mechanism and pad lockable hasp assembly.

4. Exterior finish shall be cabinet manufacturer's standard corrosion inhibiting, baked-on enamel finish over phosphatized surfaces.

5. The enclosure interior surfaces and back panels shall be finished with the cabinet manufacturer's standard corrosion-inhibiting, white high-gloss baked-on enamel finish.

2.05 CONTROL PANEL INTERNAL COMPONENTS

A. Fiber Optic Patch Panels: Provide surface mount telecommunications outlet housings of a high-density, low-profile, design with four field-configurable ports, snap-lock cover, and cable knockouts on back. Base shall include tie-wrap anchor points at all cable entrances. Housings shall be mountable with screws and have mounting holes that are compatible with standard NEMA wall boxes. Constructed of high-impact self- extinguishing plastic. UL listed.

B. CAT6 Patch Panels: Provide 24-port minimum capacity surface or rack-mount telecommunications outlet housings of a high-density, low-profile, design. Rack-mount housings shall be mountable with screws and have mounting holes that are compatible with standard 19-inch racks. Constructed of 16 gauge steel. UL listed.

C. Managed Ethernet Switches: Managed Gigabit Ethernet switches have capabilities for both Fiber Optic Cable Type ST Connections and RJ-45 10/100/1000 copper cabling. Provide output contact closure signals to indicate supply power OK and switch failure. Switches will be configured by Sound Transit with SNMP community string and IP address. Switches shall be uplinkable to Sound Transit-provided TCN switches utilizing CAT6 RJ-45 media:

1. Switches shall have a port count to accommodate Contractor provided equipment that requires Ethernet connectivity plus have 25 percent spare ports at each Ethernet switch location.

D. Terminal Blocks: Provide channel mounted, impact and combustion resistant, self-extinguishing type terminal blocks. Terminal blocks shall be rated for its use. Furnish all required end plates, channel clamps, separators and other components required for installation in accordance with the manufacturer's recommendations. Terminal blocks shall each be equipped with an appropriate label which is large enough to legibly accommodate identifying.

E. Channel Mounted Circuit Breakers: Provide units equipped with "tripped" indication rated to protect the equipment. Channel mounted breakers shall mount on the same size and type of mounting channel as the terminal blocks specified herein and shall possess terminals each capable of accommodating one #14 AWG wire of the type specified herein. Each breaker shall be equipped with an appropriate label and labeling space large enough to legibly accommodate a three-digit identifying number. Provide thermal- magnetic type circuit breakers with a "normal blow" tripping characteristic curve. Provide selective coordination of all upstream and downstream circuit protection devices.

F. Wire way: Provide slotted type plastic wire ways, with covers, of the size for neat installation of interconnecting conductors. Wire ways shall be restricted slot type to prevent accidental removal of wires and shall be constructed of rigid, non-flammable polyvinyl chloride (PVC). Wire way shall be UL recognized for continuous operation at 140 degrees Fahrenheit.

G. 24VDC Power Supplies: Provide regulated 24 volt DC power supplies. Power Supplies will be rated for temperature range minus 20 degrees Celsius to 60 degrees Celsius. Power supplies shall be sized to provide output power of additional 33 percent of initial design load.

H. Surge Protection on incoming power for equipment protection. Provide SPD devices that meet UL 1449 and UL 1283 specifications.

I. Each BMS control enclosure and control panel shall be provided with a 120VAC GFCI convenience receptacle for use by portable lap-top computers

J. Shall Meet NEC Requirements for listing short circuit rating 409.22 and 409.110.

K. Shall Meet NEC Requirements for Wiring Space and Wire Bending Space 409.104

L. Shall be UL 60947-4-1 compliant.

PART 3 - EXECUTION

3.01 SEQUENCE OF OPERATION

A. The BMS System shall be programmed to operate all equipment and interfaces as specified herein.

B. The HMI shall dynamically display current status or position of each item of equipment.

C. Normal Operation:

1. The HMI indicates ‘Normal’ system status.

2. Ventilation, HVAC, vertical circulation, communications system, and plumbing systems operate according to their normal sequence of operations.

D. Abnormal Operation:

1. Each item of equipment shall be monitored via device feedback to ensure correct operation. Failure of equipment to respond correctly within the timeout period limits shall result in the following actions:

a. An alarm message shall be displayed on the HMI. The message shall indicate the specific equipment, device and nature of the alarm.

3.02 EXAMINATION

A. Verify that conditioned power supply is available to control units, HMI and server. Verify that field end devices and wiring are correctly and securely installed before proceeding with installation.

3.03 INSTALLATION

A. Install equipment as indicated to comply with manufacturer's written instructions.

B. Install software in control units and HMI. Implement all features of programs to specified requirements and appropriate to sequence of operation.

C. Connect and configure equipment and software to achieve the sequence of operation specified.

D. Verify location of exposed control sensors with plans and structural details before installation. Control sensor to be mounted a minimum of 60 inches above finished floor.

E. Install labels and nameplates to identify control.

3.04 ELECTRICAL WIRING AND CONNECTIONS

A. Install all cables and conductors in raceway.

B. Conceal raceway, except in mechanical rooms and areas where other conduit and piping are exposed.

C. Bundle and harness multi-conductor instrument cable in place of single cables where several cables follow a common path.

D. Fasten flexible conductors, bridging cabinets and doors, neatly along hinge side; protect against abrasion. Tie and support conductors neatly.

E. Label all control conductors, utilizing identifying labels shown on the Construction Drawings, for future identification and servicing of control system.

F. Connect electrical components to wiring systems and to ground as indicated and instructed by manufacturer. Tighten connectors and terminals, including screws and bolts, according to equipment manufacturer's published torque-tightening values for equipment connectors. Where manufacturer's torqueing requirements are not indicated,

G. tighten connectors and terminals according to tightening requirements specified in UL 486A-86B.

H. Megger and continuity test all cable conductors after termination, but prior to landing.

3.05 FIELD QUALITY CONTROL

A. BMS Signal Integrity: Perform field quality checks as part of the Pre-Commissioning Checklist to verify interconnections between the BMS system and the field instruments and devices. All signal interconnections shall be individually physically verified for proper terminations and noted on the Pre-Commissioning Checklist. Completed checklist shall be submitted as part of the final test report.

B. ITCs: Perform field quality checks as part of the Pre-Commissioning Checklist to verify correct interconnections between the ITC terminals and the field equipment, instruments and devices. All signal interconnections shall be individually physically verified for proper terminations and noted on the Pre-Commissioning Checklist. Completed checklist shall be submitted as part of the final test report.

C. For any reason NRTL certifications or listings for BMS enclosures are voided throughout construction, provide field re-certification.

3.06 COMMISSIONING

A. Refer to Section 25 08 50 - Commissioning of Facility Controls.

B. Replace, at no cost to Sound Transit, all controls and equipment found to be damaged, malfunctioning, or that does not meet acceptable system performance standards. Submit a corrective action plan for all noted deficiencies identified during the commissioning process.

3.07 TRAINING

A. Provide training for a minimum of eight Sound Transit Employees on-site or at a Sound Transit office location as follows:

1. Training in the receipt, handling, and acknowledgment of alarms.

2. Training in BMS operation including logging-in, reviewing alarm and status displays, navigating HMI graphical screens, and the initiation of both automatic and manual control output actions from the BMS HMI's.

3. Training in BMS functional operation and monitoring of each BMS subsystem within the garage. Training to include complete overview of system operation and available operating modes and parameters.

4. Training on trending, archiving, and report generation using data points available within the BMS.

5. Maintenance training covering each aspect of both the hardware and software elements of the BMS including preventative maintenance, emergency repair, and control unit and HMI programming development and modification.

6. How to configure and deploy each type of spare component

7. Provide video recording of the training and allow duplication and distribution within Sound Transit.

3.08 SPARE PARTS

A. All spare parts shall conform to the requirements of PART 2 - PRODUCTS, of this Section.

B. Provide the below indicated quantity and type of new spares, in original unopened packaging, to enable the replacement of the following components in the event of a failure:

1. Six of each type of fuse used within the BMS system.

2. Two of each type and rating of relays and contactors used.

3. Three of each type of relay/contactor/module socket base used.

4. Two of each type and rating of channel mounted circuit breakers used.

5. One of each type of controller, remote I/O, communications graphics card, DI module, DO module, analog module, and power supply module used. Update software with the same version as the operational system 30 days prior to system acceptance.

3.09 DISPLAY GUIDELINES

A. Display development and configuration shall be based on Sound Transit garage display standards.

1. Provide an overview screen of the facility.

2. Provide a detailed screen of the equipment systems.

3. Provide a hierarchal means of navigation between overview and detail screens

a. Provide Graphics showing the operational status of the following:

1) Fans.

2) Dampers.

3) Ductwork sensors.

4) ACU.

5) AHU.

6) Heating Devices.

4. Graphics shall utilize device and tag numbering based upon contract documents.

5. Provide a means of trending multiple data points on a variable time scale.

6. Time scale shall trend from seconds to days.

B. Alarm message configuration shall be developed based on Sound Transit garage alarm standards:

1. Provide an alarm summary.
2. Provide a means of acknowledging alarms.
3. Provide a means of archiving alarm messages.

SECTION 25 60 00

INTEGRATED AUTOMATION LINK STATION CONTROLS

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for the building management system (BMS) and emergency ventilation system (EVS), collectively called the field control system (FCS), equipment for the ventilation, vertical circulation, electrical, and mechanical system components, including control components for units that are not supplied with factory-wired controls. Items to be furnished include control equipment and software programming as well as communications and data transmission equipment and related software programming.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents.

1. American National Standards Institute (ANSI):

a. ANSI T1.329 Network Equipment - Earthquake Resistance.

2. Institute of Electrical and Electronics Engineers (IEEE):

a. IEEE C37.90.1 Surge Withstand Capability (SWC) Tests for Relays and Relay Systems Associated with Electric Power Apparatus.

b. IEEE C62.41.1 Guide on the Surge Environment in Low-Voltage (1000 V and Less) AC Power Circuits.

3. National Electrical Manufacturers Association (NEMA):

a. NEMA IA 2.3 Programmable Controllers Part 3: Programming Languages.

b. NEMA ICS 1 Industrial Control and Systems General Requirements.

c. NEMA ICS 1.1 Safety Guidelines for the Application, Installation, and Maintenance of Solid State Control.

d. NEMA ICS 2 Controllers, Contactors and Overload Relays Rated 600 Volts.

e. NEMA ICS 4 Application Guide for Terminal Blocks.

f. NEMA ICS 6 Enclosures.

4. National Fire Protection Agency (NFPA):

a. NFPA 70 National Electrical Code.

b. NFPA 72 National Fire Alarm and Signaling Code.

c. NFPA 130 Standard for Fixed Guideway Transit and Passenger Rail Systems.

5. Military Specification (MIL):

a. MIL-STD 1472G – Human Engineering.

6. Telcordia:

a. GR-63-CORE NEBS Requirements: Physical Protection for Fiber Distributing Frames.

7. Underwriters Laboratories Incorporated (UL):

a. UL 508A Standard for Safety of Industrial Control Panels.

b. UL 486A-86B Standard for Safety of Wire Connectors.

1.03 SUBMITTALS AND TRANSMITTALS

A. Submit the following:

1. Equipment Integration Plan. Provide a plan that includes allowances for regular status review meetings with Sound Transit representatives during factory testing, installation and commissioning to ensure interoperability with existing and future systems. Include a description for how:

a. The designs are integrated within this scope of work, including identifying coordination meetings with appropriate sub-contractors, such as Mechanical, Fire alarm, Access Control, and Electrical.

b. The design and installation are integrated with the existing ST infrastructure.

c. The design and installation is integrated with SCADA work. The Systems Integration plan shall document the proposed method for BMS and EVS SCADA interfaces. See Exhibit C for guidelines on the SCADA – PLC interface functionality.

d. How work and submittals will be sequenced with the Systems Contractor to ensure integration.

2. Submit the items described below:

a. Shop Drawings containing the following information for each FCS control panel and enclosure:

1) Include the product data for each type of product specified within the Shop Drawing submittal. Include manufacturer's technical Product Data for each FCS system component furnished, indicating dimensions, capacities, performance characteristics, electrical characteristics, finishes of materials, installation instructions, and startup.

2) Hardware and software bill of materials.

3) Drawing List

4) Listing of connected data points, including connected control units and input devices. See FCS drawing subset for a preliminary list of I/O points. The Contractor shall confirm all points required to

perform mechanical, electrical and vertical circulation control logic is included in the list and if not add required I/O to be able to perform the logic.

5) Shop Drawings detailing equipment assemblies or components and indicating dimensions, weights, loadings, required clearances, method of field assembly, and location and characteristics of each field connection.

6) Each control device labeled with setting or adjustable range of control.

7) Diagrams for all required interconnecting wiring. Clearly differentiate between factory-installed and field-installed wiring.

8) Each conductor labeled utilizing identifying labels.

9) Manufacturer's general and detail arrangement drawings for switches and enclosures.

10) Provide all dimensions including enclosure.

11) System configuration showing I/O and peripheral devices, power supplies, diagrams, and interconnections.

12) Details of interface terminal cabinets (ITC), control panel and enclosure faces, including controls, instruments, and labeling.

13) Each I/O point labeled utilizing unique identifying labels. Use indicated labels where shown on the Plans.

14) Wiring diagrams detailing wiring for power, signal, and communications systems and differentiating clearly between manufacturer-installed and field-installed wiring.

15) Schematic flow diagram showing HVAC, dampers, and other control devices served.

b. Human machine interface (HMI) system graphics indicating monitored systems and devices, data (connected and calculated) point addresses, and operator notations. A representative sample of full scale, full color HMI prototypes of each type of screen shot in both hard copy and soft copy format:

1) Process screens.

2) Process and alarm screens.

3) Diagnostic and status screens.

4) Trending and logging screens:

a) Data shall be recorded continuously with a minimum of two years available for trend displays.

b) Coordinate method for data storage with Sound Transit.

5) HMI description, including:

a) Narrative overview of HMI describing navigation between categories and views, including popups.

b) Description of equipment status display and alarm visibility convention.

c) Written sequence of operation for each category providing logic and control, including set points. For I/O be passed through or monitored only, provide an explanation of screens and status indications.

c. Control programs, fully annotated to describe the function of each programming element and each functional segment for each Station.

d. IP Address List for all contractor-provided FCS devices connected on a network:

1) Develop and assign unique addresses based on Sound Transit guidance.

e. Submit a list of Ethernet switch requirements for switches to be provided by Sound Transit. The template, provided by Sound Transit, shall be populated by the Contractor.

f. Monitored/Controlled equipment list.

3. Testing, Commissioning, and Training Plans. Submit the following:

a. Provide a factory test plan and test procedure. This correlates to FCS Factory Tests and Inspection commissioning activities as stated in the Contract Documents:

1) Commissioning:

a) Support the project's Testing and Commissioning Manager with the planning and execution of tasks involving Division 25 components. Reference General Commissioning Requirements as stated in the Contract Documents.

b) Plans for a factory test must be submitted and approved prior to scheduled factory acceptance test activities. This procedure shall include detailed procedures and forms for performing Factory Acceptance Tests necessary to verify the performance of all active components in the FCS.

b. Training:

1) Submit a plan and course materials in digital format to be used for FCS training, tailored to the following departments:

a) Operations.

b) Maintenance.

c) Engineering.

4. Systems Interface Data Table (SIDT):

a. Provide an Excel spreadsheet list of points available for reading and writing from the building management system provided by the Contractor to the SCADA system provided or modified by Contractor, and another one from the emergency ventilation systems provided by the Contractor to the SCADA system provided or modified Contractor. The Contractor is required to submit the SIDT in the required format. A mostly complete version of the SIDT must be approved before start of the Contractor's Factory Acceptance Test (reference Contract drawings).

b. Provide a comprehensive list of all I/O points that includes both the field side points interfaced to monitored/controlled equipment, and on the HMI side for points developed in field controller logic interfaced through the OPC servers:

1) Include the following columns for descriptive fields for each point:

a) Unique point ID (typically the HMI tagname).

b) Equipment: ID of the equipment or device associated with the point.

c) Equipment description, air conditioning unit, UPS, etc.

d) Physical location of the equipment.

e) Point Description: Meaningful description for the point. The description should go from general to specific so that alphabetical sorting of the spreadsheet will group points relating to the same device together.

f) Point Functional Description: A description of the functional purpose of the point, if applicable. For example, to be exchanged with remote SCADA system.

g) Station ID.

h) Station Name.

i) Field Controller: ID of field controller where the point is read/written.

j) Field Controller I/O base ID.

k) Address of the point in Field Controller memory.

l) Address of the point in register memory, including bit number for discrete points and Modbus address for AIM SCADA integration.

m) Field Controller IP address.

n) Field Controller CPU Type.

o) Point Type:

i) AI (analog input).

ii) AO (analog output).

iii) DI (discrete input).

iv) DO (discrete output).

v) LAI (logical analog input from field controller to HMI).

vi) LAO (logical analog output to field controller from HMI).

vii) LDI (logical discrete input from field controller to HMI).

viii) LDO (logical discrete output to field controller from HMI).

p) State: For discrete points, a description of the on and off states in the form “On Description/Off Description”. For analog points, enter “NA”.

q) Alarm: For discrete inputs enter On/Off/None for the active alarm state. For analog inputs enter value.

r) EU: For analog points, the range and units of the scaled point, for example: “0-10 psi”.

s) For analog points, enter limits:

i) Minimum.

ii) Maximum.

t) For analog points, enter alarm limit range set points:

i) High-High.

ii) High.

iii) Low.

iv) Low-Low.

u) Indicate whether point is logged in the historical database. Logging of the following points are required, at minimum:

i) All analog points.

ii) All alarms.

iii) All discrete inputs and outputs.

5. Closeout Submittals:

a. As-Built Documents: Record actual locations of control components, including all field components and sensors. Revise Shop Drawings to reflect actual installation and operating sequences. Include all data specified in Article 1.03, herein.

b. Provide Operation and Maintenance Manuals:

1) The manual shall provide a clear explanation of the theory, operation, and maintenance of the equipment accompanied by photos and schematic, wiring and mechanical assembly diagrams, as required. The manual shall be indexed and cross-referenced in an easily understood manner. The manual shall be loose leaf bound and shall include, but not necessarily be limited to, the following information:

a) Operating instructions.

b) HMI screenshots and a navigation manual for the HMIs.

c) Troubleshooting and fault isolation procedures for on- site level repair.

d) Equipment replacement procedures.

e) Disassembly and reassembly instructions.

f) A list of the components that are replaceable at the three possible levels of maintenance: on site, department shop, and the manufacturer's facility.

g) A test procedure to verify the adequacy of repair work.

h) A preventive maintenance schedule and instructions for the replacement of any electrical equipment, e.g., I/O cards, software, controller cards, etc.

i) A preventive maintenance schedule for inspection, removal, and replacement for each component.

j) A list of special tools provided by the manufacturer.

k) A list of recommended tools and test equipment required to perform all maintenance tasks.

l) Recommended spare parts list for one year's operation.

m) Interchangeable parts list showing parts common to items of equipment.

n) Equipment manufacturer's' descriptive literature including catalog cuts.

o) Record drawings.

p) The latest service bulletins, with issue dates, that describe service procedures.

q) The software source programs as well as trouble shooting, fault diagnostics, and shutdown procedures.

r) Computer software: Hard and electronic copies of the processor application source code, data table allocations, and descriptions of main software modules.

s) Training materials for FCS system operation and maintenance training sessions as specified herein.

6. Spare Parts: Furnish spare parts in accordance with Article 3.12, herein.

B. Contractor shall submit a pre- final printout of all code and logic implemented in the PLCs and Remote I/O. The code shall be thoroughly documented to clearly explain each rung and block of code or logic.

C. Contractor shall submit a final printout and electronic version of the as-built SIDT and all logic implemented in the PLCs and Remote I/O. The code shall be thoroughly documented to clearly explain the logic and code.

D. Transmit the following:

1. System Integrators Qualifications. Provide a printed certified qualification resume of the contractor or systems integrator performing the fabrication, configuration, and programming of the FCS components no later than 120 days after NTP

1.04 QUALITY ASSURANCE

A. Manufacturer Qualifications:

1. FCS hardware must be sourced from a limited number of manufacturers to ensure optimal operation and maintenance support. All manufacturers must have a proven track record in manufacturing components with the required capabilities and a successful operational history of at least five years.

2. The programmable controller manufacturer or the manufacturer's approved system integrator shall maintain a national network.

3. To facilitate future support, purchase FCS Controller and remote I/O hardware from a vendor within 150 miles of the Project. Available support within 150 miles of the Project shall include start-up service, emergency service calls, repair work, service contracts, maintenance, and training of personnel.

4. Provide a listing of at least five projects of similar magnitude, complexity and facility use type completed within the past five years.

B. System Integrator Qualifications:

1. The contractor or integrator shall have a minimum of 5 years' experience related to design, fabrication, programming, installation, start-up, and testing of similar control systems.

2. If more than one Contractor or systems integrator is employed, submit a certified resume for each one indicating their specific specialty and item of work:

a. Demonstration of technical competency with FCS system manufacturers is required through relevant certifications or reference letters from manufacturers/vendors, or hands-on demonstration if requested by the Resident Engineer.

C. Commissioning/Startup Personnel Qualifications: Where necessary, engage specially trained personnel in direct employ of manufacturer of FCS control system components.

1.05 FACTORY TESTS AND INSPECTIONS

A. General:

1. The following specifies the testing requirements for the processor equipment and HMI to be procured under this Contract. All tests described herein shall not preclude any additional standard tests normally performed by the manufacturers for similar equipment or requested by the Resident Engineer to verify performance.

    a. Transmit notice of scheduled factory test dates prior to proposed testing date(s). The notification shall include the expected duration and sequence of testing. Observations made during the tests, and test results shall be recorded in a document form acceptable to the Resident Engineer, certified by Contractor and submitted to the Resident Engineer for record before shipping equipment to site. All expenses in connection with or incidental to the testing shall be borne by Contractor excluding Resident Engineer travel expenses.

    b. The test procedure specified shall be sequential in the order prescribed. HMI, processor, communications equipment, or any components, which failed to perform as specified, shall be subject to retest at no addition cost to the Agency.

    c. All Factory Testing is to be complete prior to commissioning of the system.

B. HMI, Programmable Automation Controller (processor) and Remote I/O System:

1. Arrange for factory testing of the networked BMS workstation HMI, BMS and EVS processors, Ethernet switches, and remote I/O systems. Tests shall be witnessed unless otherwise determined by the Engineer.

2. Witnessed Tests shall be tested for operation, sequencing, inter-locking, communications, diagnostics, fault conditions, data logging and alarming functions as outlined in this Specification and the Drawings. All field functions shall be simulated in the factory for the purpose of this test. Witnessed testing activities shall include:

    a. Network ping testing.

    b. Network configuration verification, including switch and host addressing, redundant media, and switch failure response.

    c. Panel and PLC power supply fault response.

    d. Simulated field equipment interface for the following:

        1) Heat Pumps, AHUs and ACUs normal and fire response.

        2) Supply and exhaust fans normal and fire response.

        3) Motorized and solenoid actuated dampers and smoke dampers normal and fire response.

        4) Access controlled doors, including fire response.

        5) Coiling door and grilles, including fire response.

        6) FACP.

        7) Hydrogen alarm.

8) Clean agent alarm.

9) Lighting controllers.

10) Sump pump controllers.

11) Temperature sensors.

12) Temperature or pressure control loops performed by BMS.

13) Heating equipment.

14) Public address system.

3. Unwitnessed factory tests and checks shall include:

a. Check of control and power wiring insulation resistance and freedom from shorts and grounds.

4. Input/Output Points Validation Testing:

a. Prepare test forms for all points in the accepted preliminary SIDT.

b. Add validated column to spreadsheet for witness initials and witnessed date of successful demonstration of the point.

c. Demonstrate correct manipulation of I/O, including those in the SIDT and related functionality to Sound Transit representative in the field.

d. Demonstrate supervised response for all supervised-type discrete inputs and outputs.

e. Demonstrate points through actual operation of equipment or demonstration or by simulation if accepted by the Resident Engineer.

f. For testing convenience provide tables of the real and logical points in the HMI to easily verify the actual state of each point.

g. Test Modbus TCP interface to Sound Transit's Rockwell Collins HMI by simulating the remote server.

h. Demonstrate functionality of network interface to typical HVAC and power monitoring field equipment

C. Integrated EVS Testing:

1. Provide factory testing of the integrated EVS for each Station (Expanded EVS). These tests shall be witnessed unless otherwise determined by the Resident Engineer.

2. Integrated EVS testing shall take place by simulating all I/O and modes associated with the Expanded EVS including I/O for BMS, EVS and FACP at each Station. If construction sequencing allows, include SCADA in testing for verification of EVS I/O.

3. Equipment identical to that to be used for the operational, expanded EVS shall be provided, configured, staged, and network-connected at the factory test site:

a. Provide unique test PLCs and HMIs for BMS and EVS corresponding to each Station. This includes BMS and EVS processors BMS HMIs, and FACPs.

D. Historian Testing:

1. Provide a list of points to be sampled and stored in the historical server.

2. Demonstrate sampling and summary configuration for representative points.

3. Demonstrate trending interface for typical points.

1.06 FIELD MEASUREMENTS

A. Verify field conditions, measurements, and clearances prior to fabrication and installation of FCS system components.

1.07 MAINTENANCE SERVICE

A. Support:

1. There shall be FCS integration support personnel on- through the below periods:

a. Pre-revenue testing period:

1) Following installation, testing and commissioning, Sound Transit plans to operate the system in a pre-revenue testing mode to understand equipment performance, traction power, train control and related system components.

2) During this phase, the Contractor shall provide on-site technical advisors to assure continued operation of the FCS.

b. After Final Acceptance:

1) Provide support for hardware and software for a year after Final Acceptance.

2) Upon completion of a year of maintenance support system administration right shall transfer solely to Sound Transit.

3) Provide original source code to an escrow account at this time. Sound Transit will take possession of the source code in the account and unrestricted license to it if either the Contractor goes out of business or if the Contractor no longer supports the product(s) directly associated with the source code.

4) Contractor support shall respond to a problem report within 4 hours during normal business hours defined here as 9:00 a.m. to 5:00 p.m. Monday through Friday, Pacific time, and shall respond to a problem within 8 hours at all other times.

2. The programmable controller manufacturer or the manufacturer's approved system integrator, shall maintain as part of a national network, engineering service facilities within 150 miles of the project site, to provide start-up service, emergency service calls, repair work, service contracts, maintenance, and training of personnel. Emergency service shall be available within 24 hours of notification. During revenue service operations, the PLC manufacturer shall provide on call support.

1.08 POWER LINE PROTECTION AND SIZING

A. Equipment connected to ac circuits shall be protected from power-line surges. Equipment protection shall meet the requirements of IEEE C62.41. Fuses shall not be used for surge protection.

B. AC input power loads for the FCS panels, cabinets, and racks connected to the AC distribution system shall be submitted so that upstream distribution overcurrent protection and UPS capacity can be evaluated prior to approval of submittals and FCS panel fabrication.

1.09 DELIVERY, STORAGE AND HANDLING

A. Store equipment and materials inside and protected from weather and other hazards.

PART 2 - PRODUCTS

2.01 SYSTEM DESCRIPTION

A. The FCS control processing equipment shall be comprised of:

1. PLC chassis for both the EVS and BMS PLCs, housing modules including: control processors, Ethernet communications modules, and fiber optic communication modules.

2. I/O chassis, including all modules necessary for interface with field devices.

3. A summary processor warning alarm for all detectable, non-fatal faults in the controller chassis or I/O chassis.

4. A summary processor fail alarm for major faults including failure of a processor.

5. Appropriate analog and discrete I/O processing modules for monitoring and control of station electrical, mechanical, vertical circulation, and station plumbing systems and equipment.

B. Provide a HMI, equipment, software, and functional programming:

1. The BMS HMIs shall be a centrally located server-based system with a desktop workstation housed in each Station at the location indicated in the drawings. The central graphics and historical servers consist of existing equipment located in the Operations and Maintenance Facility (OMF) and the Backup Data Center (BDC). The existing graphics and historical server applications shall be enhanced to incorporate all elements needed to bring the new Stations online.

2. The desktop HMI shall allow Operator access to all equipment and systems via the same log-in screen. It shall allow access to programming and control commands, control software programming languages, and graphical representations. Develop dynamic control and monitoring displays representing station electrical, station mechanical, vertical circulation, and station plumbing systems and equipment.

3. Reference EXHIBITS at the end of this Section for the display symbols, colors, and example layouts that shall be followed to ensure that the HMI graphics provided by the Contractor conform to that at other stations in the system.

4. Contractor shall assume the level of detail, color, symbols and other display attributes shall be similar or the same as that as in EXHIBITS: FCS systems.

5. A prototype of the displays shall be developed in close coordination with Sound Transit's operations and engineering staff. This coordination will require reiterative modifications to the display. The Contractor shall assume this iterative process. The final version of the prototype shall be submitted to Sound Transit for approval. Operator access to the FCS HMI, for the purpose of system manipulation, shall not be designed or implemented to occur from any device other than the dedicated HMIs. This access shall be password protected.

6. The HMIs shall be connected to the FCS system via a Contractor provided IP local area network (LAN):

   a. For the BMS this shall be the existing train control network (TCN).

   b. For the EVS this shall be the existing emergency fan network (EFN).

   c. Coordinate network connections to TCN and EFN with the Systems Contractor providing the extended backbone infrastructure for these networks.

7. The I/O for this equipment shall be as indicated in the contract drawings.

C. Provide Remote I/O compatible with the FCS control processing equipment.

D. Provide communication equipment and fiber and copper cable transmission media, as well as required communication programming to transmit at each location shown on the Contract Drawings. See communications horizontal cabling as stated in the Contract Documents for FCS cable and conductor requirements.

E. Provide control equipment and associated software programming at each location shown on the Contract Drawings:

1. Develop software programming to achieve the functionality required for:

   a. Mechanical equipment sequence of operations.

   b. Plumbing equipment sequence of operations.

   c. Access control and monitoring.

   d. Fire Alarm response and monitoring.

   e. Power monitoring.

   f. Lighting control.

   g. PA/SCU interface for EVS.

2. Coordinate software programming with existing sites.

3. Coordinate software programming with Link Control Center:

   a. SCADA output commands.

   b. Alarm and Event information.

4. Provide Historical Collection of data.

F. Provide non-proprietary, open standard, communications network for the use of the FCS as indicated.

G. The EFN communications network shall be used exclusively for the EVS.

H. Provide control equipment and associated software programming at each location shown on the Contract Drawings.

I. The FCS shall provide overall system response time meeting the following requirements:

1. Digital input changes shall be indicated on HMI display within a maximum of 2 seconds following field device change.

2. Analog input changes beyond a change detection threshold shall be indicated on HMI displays within a maximum of 5 seconds following field device change.

3. Digital output commands entered at the HMI shall start execution in the field within a maximum of 2 seconds following command execution at the HMI.

J. Include installation and calibration, supervision, adjustments, and fine-tuning necessary for complete and fully operational system.

K. The complete system shall be designed for operation under the following environmental conditions. Where the installed location cannot provide the environment required, Contractor shall provide appropriate heat sinks and air tight enclosure to protect the system:

1. Ambient temperature: 0 degrees to 60 degrees Celsius

2. Relative humidity: 5 percent to 95 percent

L. The Contractor shall have the following additional responsibilities under the scope of this contract:

1. Provide submittal and/or record documentation.

2. The Contractor shall be directly responsible for the coordination and integration of the FCS with motor controls, packaged equipment controls, instrumentation, and other related equipment. The Contractor shall be responsible to obtain submittal information on the equipment specified or provided by other suppliers or disciplines. The Contractor shall communicate directly with the manufacturers and suppliers of all related equipment to determine all details of the equipment that may influence or affect the control system. The Contractor shall determine all requirements for and shall integrate all the equipment of the FCS into a unified and operational system as outlined in the Contract Documents.

3. Provide specified Sound Transit personnel training.

4. Participate in specified commissioning process of related equipment:

   a. FACP (Fire Alarm Control Panel).

   b. Mechanical equipment.

   c. Vertical transportation system.

   d. Electrical system.

5. Perform all system start-up and commissioning procedures as required and described by this Section.

6. Respond to project punch list and correct any system deficiencies.

2.02 MANUFACTURERS

A. Processor Equipment:

1. General Electric (GE) RX3i Platform:

a. Provide Ethernet Communications.

b. Provide Profinet Communications.

c. Provide 12 Slot expandable Bases.

d. Provide 16 point DI/DO Cards.

e. Provide 8 point Differential Current or Voltage Analog cards with isolation.

f. Remote I/O Equipment.

2. Approved Equal.

B. Fiber Optic Communications Equipment:

1. Phoenix Digital.

2. Approved Equal.

C. Ethernet Switching Equipment:

1. Switches are provided and configured by Sound Transit.

2. Provide mounting space, hardware, power supply, and communications cable connections for all switches installed in FCS control panels, racks, and cabinets. Ensure physical, electrical, and connection details are coordinated within Sound Transit using the Ethernet switch list submittal.

D. HMI Application Software:

1. GE Cimplicity.

2. Approved Equal.

E. Enclosure and Panels Seismic rated for zone installed:

1. Chatsworth.

2. Hoffman/Pentair.

3. Saginaw Control & Engineering.

4. Approved Equal.

F. Conduit Raceway:

1. Carlon.

2. Approved Equal.

G. Fiber Distribution Panel:

1. Corning.

2. Telect.

3. Approved Equal.

H. Ethernet Patch Panel:

1. FS.

2. Leviton.

3. Approved Equal.

2.03 SYSTEM CONTROL EQUIPMENT DESCRIPTION

A. FCS power requirements:

1. Permanent power for equipment will be provided by the Systems contractor UPS.

2. However, the Contractor shall provide temporary power for all FCS equipment and communications to enable the Contractor's complete testing before the Systems contractor UPS is installed.

3. Provide power from the communications room ac power system to power all FCS electronic equipment, i.e. – PLCs, RIO, IP switch, power supplies, etc. prior to the Systems Contractor installing the UPS.

B. FCS equipment environmental operating parameters:

1. Temperature:

a. In Communication Rooms: 50 degrees Fahrenheit to 95 degrees Fahrenheit (10 to 35 degrees Celsius).

b. All other locations including Communications Closets: 32 degrees Fahrenheit to 140 degrees Fahrenheit (0 to 60 degrees Celsius).

2. Relative humidity: 5 to 95 percent relative humidity.

3. Atmospheric pressure: 795 to 1080 kPa.

C. Building Management System HMIs:

1. BMS Workstation:

a. Gather software/hardware requirements through the request for information process.

b. Minimum sized to meet the above response time metrics when operating with twice the number of I/O in initial configuration.

c. Consult with Sound Transit IT department prior to purchase and provide in accordance with Sound Transit standards.

d. Workstation shall be confirmed and approved with ST Operations Technology before purchase.

e. Specified to operate in the environment where it will reside.

D. PLC Control Units:

1. GE RX3i system or approved equal.

2. Shall be comprised of a control chassis, housing PLC modules including: Control processor, Ethernet I/P module, and fiber optic communication modules. This layout shall provide communications for EVS and BMS controlled or monitored equipment and interfaces.

3. Fault Monitoring:

   a. Provide a summary PLC warning alarm for detectable, non-fatal faults in the controller chassis or I/O chassis.

   b. Provide a summary PLC fail alarm for major faults.

   c. Every monitoring device and link part of the BMS and EVS shall be monitored. Any device or link fault shall report as an alarm on the alarm manager for that system.

4. EVS monitoring must conform to requirements of NFPA 72 and 130.

5. Units monitor or control each input/output point; process information; execute commands from operator terminals or LCC operators; and download data from or upload data to HMI units.

6. Control Units shall be equipped with web server capability to provide control and status information to web-browser-based applications.

7. Control functions operate, regardless of system communications network status, over the fiber optic I/O network communication links. Functions include the following:

   a. Discrete/digital and analog.

   b. Monitoring, controlling, or addressing data points.

8. FCS I/O circuits that interface to the FACP shall be supervised type.

9. Each FCS control panel shall continuously perform self-diagnostics, communication diagnosis and diagnosis of all subsidiary equipment. Information concerning detected diagnostic faults shall be broadcast network-wide via the I/O network.

10. All necessary software to form a complete operating system as described in this specification shall be provided. Applicable software programs shall be provided as an integral part of each FCS panel and shall not be dependent upon any higher-level computer for execution.

11. Sensor and Control Wiring Surge Protection: Controllers shall have sensor and control wiring surge protection with optical isolation, metal oxide varistors (MOV), or silicon avalanche devices. Fuses are not permitted for surge protection.

E. FCS System Communications Network (LAN):

1. Ethernet/IP and Profinet communications protocols that support communications at 1000Base-LX.

2. Communication via single mode fiber optic cables.

3. IP Addressing:

a. Except for FCS switches provided by Sound Transit, any IP addressing that is required for equipment being installed under the contract that is not addressed by the specification will require an RFI at least 3 months prior to the anticipated need for configuration and subsequent approval by Sound Transit before being used.

4. The network shall be time synched to Sound Transit's TCN (for BMS) and EFN (for EVS) domains.

F. Software:

1. With approval from Sound Transit IT, update to latest versions of software at project completion. Include and implement the following capabilities:

a. Software shall be developed to provide the control units with the functionality specified herein and on the Plans.

1) Control logic for HVAC as described in the mechanical subset.

2) Manual (operator initiated) selection and control of individual electrical, systems, HVAC, plumbing, and mechanical system components.

3) Monitoring and controlling of indicated field equipment and devices.

2. Software shall be developed to provide the HMI units with the functionality specified herein and on the Plans:

a. Input/output Capability:

1) Request display of current values or status in tabular or graphic format.

2) Command selected equipment to specified state.

3) Initiate logs and reports.

4) Change analog limits.

5) Add, delete, or change points within each control unit or application routine.

6) Change point input/output descriptors, status, alarm descriptors, and engineering unit descriptors.

7) Add new control units to system.

8) Modify and set up maintenance scheduling parameters.

9) Develop color graphic displays based on MIL-STD 1472G.

10) Automatically archive select data even when running third party software.

11) Provide capability to sort and extract data from archived files and to generate custom reports.

12) Support alarm/data printer operations.

13) Operator selectable output of screen graphical images, data trend logs, and/or alarm summary information to printer.

14) Automatic time and date stamped output of all system alarms and automatic or manual control system actions to printer.

15) Select daily, weekly or monthly as scheduled frequency to synchronize time and date. Accommodate daylight savings time adjustments.

b. Dynamic Color Graphic Displays:

1) Utilize symbols based on Sound Transit standards and ISA.

2) The system shall provide dynamic graphic data:

a) Limit output of real-time live dynamic data per graphic screen to 60 objects.

3) Up to 1,000 separate graphic pages.

4) Graphic screens to be developed in conjunction with Sound Transit staff include but are not limited to:

a) Graphic screens will match existing facilities and adhere to FCS graphic. Refer to EXHIBITS for standards utilizing available symbols, and libraries.

b) Overviews of each electrical, plumbing, or mechanical system, providing means to quickly select specific graphics and indicating system-wide operating parameters and alarms.

c) Graphical representation of ventilation equipment configuration at each specific station location, indicating status of each ventilation system component.

d) For each station system, provide screens showing user-configurable historical data trend logging of equipment status and monitored signal values.

e) System-wide alarm summary screen indicating date, time, and nature of alarm event and providing the means to quickly select the graphical representation screen pertaining to the affected equipment or system.

f) PLC and communications network overview screens indicating status and diagnostic information generated by the system communications and I/O communications network sub-systems. Screen shall include:

i) PLC status, including status of redundant PLC.

ii) I/O communication status.

iii) Media pathway status, including a break in the fiber optic ring.

c. Operator System Access: Via software password with minimum 10 access levels at HMI.

d. Database Creation and Support: Changes shall utilize standard procedures. Control unit shall automatically check workstation data base files upon connection and verify data base match. The listing shown in the drawings should be assumed to be 95 percent complete with additions or modifications to the final I/O list coordinated with the installation contractor, procured equipment, and Sound Transit. Sound Transit, at its sole discretion, may add or delete points. The Contractor shall coordinate with Sound Transit during its preliminary design to finalize the points list. The Contractor shall assume this coordination, providing additional I/O modules if required, and providing PLC or Remote I/O configuration of the revised points.

e. Minimum capability shall include:

1) Add and delete points.

2) Modify any point parameter.

3) Change, add, or delete English language descriptors.

4) Add, modify, or delete alarm limits.

5) Add, modify, or delete points in start/stop programs, trend logs, etc.

6) Create custom relationship between points.

7) Create or modify BMS loops and parameters.

8) Create or modify override parameters.

9) Add, modify, and delete any applications program.

10) Add, delete, develop, or modify dynamic color graphic displays.

f. Alarm Processing:

1) Abnormal condition: Cause alarm and appropriate message, including time, system, point descriptor, and alarm condition.

2) Critical alarm or change-of-state: Display message, stored on disk for review and sort, or print.

3) Display alarm reports on video. Display multiple alarms in order of occurrence.

4) Define time delay for equipment start-up or shutdown.

5) Allow unique routing of specific alarms.

6) Operator selectable configuration specifies if alarm requires acknowledgment.

7) Continue to indicate unacknowledged alarms after return to normal.

8) Alarm notification.

9) Display indicating alarm condition.

10) Selectable audible alarm indication.

11) All FCS system alarms shall be available via SCADA. The SCADA Contractor shall coordinate closely with Sound Transit during FCS programming to provide this functionality.

G. Firmware:

1. PLCs:

a. Ensure the firmware version is consistent between all identical PLC CPU, I/O, and communication modules provided, including all spares.

2. HMIs:

a. Ensure firmware version is consistent between all identical touchscreen HMI models provided, including spares.

2.04 CONTROL PANELS

A. Communications Room Equipment Rack:

1. Racks shall be Chatsworth Products (CPI) Seismic Frame cabinet series, or approved equal.

2. Rack shall be rated Zone 3 compliant to Bellcore GR-63-CORE for Network Equipment Building Systems (NEBS).

3. Frame: Welded steel.

4. Rack Framework: 11 gauge ASTM A570 steel.

5. Size: Sized for standard 19-inch equipment widths. 84 inch H (43 rack units), 36 inch usable depth, 27.32 inch width.

6. Paint: ANSI 61 gray and resistant to corrosion.

7. Mounting Rails: Standard EIA-310 hole pattern with pre-tapped holes.

8. Ventilation: Louvered top panel and fan to provide air flow of 400 CFM minimum.

9. Paneling: Enclosed with side panels.

10. Doors: Hinged, swing open, and removable doors.

11. Design racks to accept 120 Vac single phase service.

12. Mounting Equipment:

a. Expansion Anchors: Hilti Model HSLB M12-25 or approved equal.

b. Cabinet isolation barrier, non-conductive phenolic resin.

13. Shall be assembled by a UL 508A certified integrator.

B. Communications Distribution Cabinet:

1. Single door, enclosure rated NEMA Type 3X for locations not in a room or closet. Provide NEMA 12 for all other locations.

2. Enclosures shall, as a minimum, be constructed of 16 gauge steel with all seams continuously welded and smoothly finished, and shall possess integral, rolled lip framing around the door to prevent dirt, water, and other debris from falling into the cabinet when the door is opened.

3. Enclosure door shall be fully gasketed with glued-in-place oil resistant gaskets and shall be equipped with a screwed-down door clamp mechanism and pad lockable hasp assembly.

4. Exterior finish shall be cabinet manufacture's standard corrosion inhibiting, baked-on enamel finish over phosphatized surfaces.

5. The enclosure interior surfaces and back panels shall be finished with the cabinet manufacturer's standard corrosion-inhibiting, white high-gloss baked-on enamel finish.

6. Shall be assembled by a UL 508A certified integrator.

C. Interface Terminal Cabinets (ITCs):

1. Provide wall-mounted, single door, enclosures rated NEMA Type 3X where not in a room or closet and NEMA 12 for all other locations.

2. Enclosures shall, as a minimum, be constructed of 16 gauge steel with all seams continuously welded and smoothly finished, and shall possess integral, rolled lip framing around the door to prevent dirt, water, and other debris from falling into the cabinet when the door is opened.

3. Enclosure door shall be fully gasketed with glued-in-place oil resistant gaskets and shall be equipped with a screwed-down door clamp mechanism and pad lockable hasp assembly.

4. Exterior finish shall be cabinet manufacturer's standard corrosion inhibiting, baked-on enamel finish over phosphatized surfaces.

5. The enclosure interior surfaces and back panels shall be finished with the cabinet manufacturer's standard corrosion-inhibiting, white high-gloss baked-on enamel finish.

6. Shall be assembled by a UL 508A certified integrator.

2.05 CONTROL PANEL INTERNAL COMPONENTS

A. Fiber Optic Patch Panels: Provide surface mount telecommunications outlet housings of a high-density, low-profile, design with four field-configurable ports, snap-lock cover, and cable knockouts on back. Base shall include tie-wrap anchor points at all cable entrances. Housings shall be mountable with screws and have mounting holes that are compatible with standard NEMA wall boxes. Constructed of high-impact self- extinguishing plastic. UL listed.

B. CAT6 Patch Panels: Provide 24-port minimum capacity surface or rack-mount telecommunications outlet housings of a high-density, low-profile, design. Rack-mount housings shall be mountable with screws and have mounting holes that are compatible with standard 19-inch racks. Constructed of 16 gauge steel. UL listed.

C. Managed Ethernet Switches:

1. Switches are provided and configured by Sound Transit.

2. Provide mounting space, hardware, power supply, and communications cable connections for all switches installed in FCS control panels.

3. Switches have capabilities for both Fiber Optic Cable Type SC Connections and RJ-45 10/100/1000 copper cabling.

4. Switches shall have a port count to accommodate Contractor equipment that requires Ethernet connectivity plus have 25 percent spare ports at each Ethernet switch location.

5. For TCN, Ethernet connectivity is required for the BMS. For the EFN, Ethernet connectivity is required for the EVS only.

D. Terminal Blocks: Provide channel mounted, impact and combustion resistant, self-extinguishing type terminal blocks. Terminal blocks shall be rated for its use. Furnish all required end plates, channel clamps, separators and other components required for installation in accordance with the manufacturer's recommendations. Terminal blocks shall each be equipped with an appropriate label which is large enough to legibly accommodate identifying characters.

E. Channel Mounted Circuit Breakers: Provide units equipped with "tripped" indication rated to protect the equipment. Channel mounted breakers shall mount on the same size and type of mounting channel as the terminal blocks specified herein and shall possess terminals each capable of accommodating one #14 AWG wire of the type specified herein. Each breaker shall be equipped with an appropriate label and labeling space large enough to legibly accommodate a three-digit identifying number. Provide thermal- magnetic type circuit breakers with a "normal blow" tripping characteristic curve. Provide selective coordination of all upstream and downstream circuit protection devices.

F. Wire way: Provide slotted type plastic wire ways, with covers, of the size for neat installation of interconnecting conductors. Wire ways shall be restricted slot type to prevent accidental removal of wires and shall be constructed of rigid, non-flammable polyvinyl chloride (PVC). Wire way shall be UL recognized for continuous operation at 140 degrees Fahrenheit.

G. 24VDC Power Supplies: Provide regulated 24 volt DC power supplies. Power supplies shall be sized to provide output power of additional 33 percent of initial installed load.

H. Each FCS control enclosure and control panel shall be provided with a 120VAC GFCI convenience receptacle for use by portable lap-top computers.

PART 3 - EXECUTION

3.01 SEQUENCE OF OPERATION

A. The Contractor shall provide needed raceway, wiring, hardware and program to perform mechanical, electrical and vertical circulation control logic. The FCS subset drawings has a listing of required I/O however these may not include all I/O needed to implement logic described in the mechanical, electrical and vertical circulation subset. This Contract requires the Contractor to add the needed I/O to the listed I/O and to implement all logic described in the mechanical, electrical and vertical circulation subset.

B. The BMS and EVS Systems shall be programmed to operate all equipment and interfaces as specified herein.

C. The HMI shall dynamically display current status or position of each item of equipment.

D. Normal Operation:

1. The HMI indicates ‘Normal’ system status.

2. Ventilation, HVAC, vertical circulation, and plumbing systems operate according to their normal sequence of operations.

E. Abnormal Operation:

1. Each item of equipment shall be monitored via device feedback to ensure correct operation. Failure of equipment to respond correctly within the timeout period limits shall result in the following actions:

2. An alarm message shall be displayed on the HMI. The message shall indicate the specific equipment, device and nature of the alarm.

3. All FCS system alarms status indications, and controls shall be made available to the LCC SCADA system from a Contractor-furnished and installed network connection. Contractor shall coordinate closely with Sound Transit during FCS programming. This interface shall be delivered in such a way that no BMS or EVS software or hardware configuration change would be required when the future SCADA is connected.

3.02 EVS FUNCTIONS

A. Monitors status of FACP.

B. Provide a means to remotely initiate a fire alarm at each station’s FACP.

C. The specific points and functionality shall be coordinated with the FACP subcontractor.

D. Interface between FACP and PA/SCU.

3.03 EVS VENTILATION MODES

A. [NOTE TO DESIGNER: ADD OR MODIFY AS NECESSARY BASED ON TESTS ADDED OR MODIFIED ABOVE DEPENDING UPON THE LOCATION DESIGN FOR FCS]

3.04 EVS INTERFACES

A. [NOTE TO DESIGNER: ADD OR MODIFY AS NECESSARY BASED ON TESTS ADDED OR MODIFIED ABOVE DEPENDING UPON THE LOCATION DESIGN FOR FCS]

B. Building Management System:

1. Provide sufficient discrete I/O to FACP to ensure proper BMS response as required by the mechanical sequence of operation.

2. EVS PLC discrete output for health status is monitored by the BMS PLC.

C. Fire Alarm Control Panels:

1. EVS receives indication from FACPs in alarm and sends a signal to place the FACP into alarm based on a command initiated at the LCC.

D. EVS SCADA:

1. Send and receive points with central EVS servers provided by systems contractor.

E. PA/SCU:

1. Send and receive points with PA/SCU provided by systems contractor.

2. Coordinate with PA/SCU installer for emergency announcement testing and commissioning.

3.05 EXAMINATION

A. Verify that conditioned power supply is available and matches required rating to control units, HMI and server. Verify that field end devices and wiring are correctly and securely installed before proceeding with installation.

3.06 INSTALLATION

A. Install equipment as indicated to comply with manufacturer's written instructions.

B. Install software in control units and HMI. Implement all features of programs to specified requirements and appropriate to sequence of operation.

C. Connect and configure equipment and software to achieve the sequence of operation specified.

D. Verify location of exposed control sensors with plans and structural details before installation.

E. Install labels and nameplates to identify control.

3.07 ELECTRICAL WIRING AND CONNECTIONS

A. Install all cables and conductors in raceway.

B. Conceal raceway, except in mechanical rooms and areas where other conduit and piping are exposed.

C. Bundle and harness multi-conductor instrument cable in place of single cables where a number of cables follow a common path.

D. Fasten flexible conductors, bridging cabinets and doors, neatly along hinge side; protect against abrasion. Tie and support conductors neatly.

E. Label all control conductors, utilizing identifying labels shown on the Construction Drawings, for future identification and servicing of control system.

F. Connect electrical components to wiring systems and to ground as indicated and instructed by manufacturer. Tighten connectors and terminals, including screws and bolts, according to equipment manufacturer's published torque-tightening values for equipment connectors. Where manufacturer's torqueing requirements are not indicated, tighten connectors and terminals according to tightening requirements specified in UL 486A-86B.

G. Megger and continuity test all cable conductors after termination, but prior to landing.

3.08 FIELD QUALITY CONTROL

A. FCS Signal Integrity: Perform field quality checks as part of the Pre-Commissioning Checklist to verify interconnections between the FCS system and the field instruments and devices. All signal interconnections shall be individually physically verified for proper terminations and noted on the Pre-Commissioning Checklist. Completed checklist shall be submitted as part of the final test report.

B. ITCs: Perform field quality checks as part of the Pre-Commissioning Checklist to verify correct interconnections between the ITC terminals and the field equipment, instruments and devices. All signal interconnections shall be individually physically verified for proper terminations and noted on the Pre-Commissioning Checklist. Completed checklist shall be submitted as part of the final test report.

C. For any reason NRTL certifications or listings for FCS enclosures are voided throughout construction, provide field re-certification.

3.09 COMMISSIONING

A. Refer to Section 25 08 60 – Commissioning of Link Station Controls.

B. Manufacturer's Field Services: Provide the services of a factory-authorized service representative to assist in commissioning of BMS and EVS systems.

C. Replace, at no cost to Sound Transit, all controls and equipment found to be damaged, malfunctioning, or that does not meet acceptable system performance standards. Submit a corrective action plan for all noted deficiencies identified during the commissioning process.

3.10 TRAINING

A. Refer to Training specification as stated in the Contract Documents.

B. The Contractor shall be responsible for training coordination and scheduling and for ensuring that training is completed on all equipment per the specifications.

C. Sound Transit’s operating and maintenance staff shall receive comprehensive orientation and training, to include: Training on all modes, functions, operations and maintenance of all features, systems, and equipment as a provided by this project and as defined and outlined herein.

D. Provide training for a minimum of eight Sound Transit Employees on-site or at a Sound Transit office location as follows:

1. Training in the receipt, handling, and acknowledgment of alarms.

2. Training in FCS operation including logging-in, reviewing alarm and status displays, navigating HMI graphical screens, and the initiation of both automatic and manual control output actions from the FCS HMIs.

3. Training in FCS functional operation and monitoring of each FCS subsystem within the station. Training to include complete overview of system operation and available operating modes and parameters.

4. Training on trending, archiving, and report generation using data points available within the FCS.

5. Maintenance training covering each aspect of both the hardware and software elements of the FCS including preventative maintenance, emergency repair, and control unit and HMI programming development and modification.

6. How to configure and deploy each type of spare component

7. Provide video recording of the training and allow duplication and distribution within Sound Transit.

3.11 SPARE PARTS

A. All spare parts shall conform to the requirements of PART 2, PRODUCTS, of this Section.

B. Provide the below indicated quantity and type of new spares, in original unopened packaging, to enable the replacement of the following components in the event of a failure:

1. Six of each type of fuse used within the FCS system.

2. Two of each type and rating of relays and contactors used.

3. Three of each type of relay/contactor/module socket base used.

4. Two of each type and rating of channel mounted circuit breakers used.

5. One of each type of PLC, remote I/O, communications graphics card, DI module, DO module, analog module, and power supply module used.

PURPOSE STATEMENT:

The following shall serve as a guideline for standardization in the development of Link Light Rail station Field Control Systems (FCS) point naming, Human Machine Interface (HMI) graphics, and historical collection of data. A station's FCS consists of a Building ManagementSystem (BMS) and an Emergency Ventilation System (EVS). Each FCS will interface with Sound Transit's central Supervisory Control and Data Acquisition (SCADA) system, developed by Rockwell Collins. The operational SCADA system provides situational awareness and control of the FCS systems and their connected devices. This document does not address graphics or collection of data within the central SCADA (Rockwell Collins "RC") system. However, the use of consistent point naming and PLC tags will provide consistent interfaces with the central SCADA system via a Modbus interface. The graphics and data collection discussed in this docucment pertain to the centralized "Local" BMS HMI and Historian for each station, intended to provide detailed information about systems monitored and controlled by the BMS and EVS.

- Two BMS HMI servers, one housed at the Operational Maintenance Facility (OMF) and the second redundant server at the Backup Data Center (BDC).
- A Historian server, located at the OMF.
- The centralized servers will utilize Cimplicity for the HMI graphics and GE iHistorian for data collection and trending capabilities.
- Each station will utilize a laptop locally as an interim BMS Cimplicity server for commissioning and testing until the respective Systems contract implements the network to enable connection to the centralized servers.
- Integration into the centralized servers shall be coordinated with Sound Transit Operations Technology (OT) to ensure proper software versions and configuration management. After integration, spot check testing is to be done from the centralized location of HMIs and Historian as agreed upon by the involved teams.
- Each station will provide a client workstation located in the Fire Command Center (FCC) or Fire Command Room (FCR) room as the permanent BMS HMI, which will interface with the central servers to provide graphical and historical information at all the programmed stations.
- Local touch screen clients at Remote I/O (RIO) for BMS will be limited, location to be determined with ST and future contract documents.
- The EVS will not interface with the Cimplicity server. The operational RC SCADA is the primary interface and control for the EVS. For tunnel stations, an Emergency Ventilation Control Panel (EVCP) touchscreen will serve as the local HMI, located in the FCC room. Additional RIO touchscreens will be located near Fan Control Panels. EVS touchscreens utilize GE QuickView screens for graphics and programming.
- The Historian (GE iHistorian) will interface with each tunnel station EVS to collect data related to fan operation. As the EVS and BMS are on two independent networks, the interface will occur through a data concentrator at the OMF.

CENTRALIZATION OF LOCAL HMI & HISTORIAN:

Northhgate Link Extension (NGLE) is developing a centralized "Local" BMS HMI and Historian with the intent that future stations, including East Link (ELE) will be integrated. The system developed by NGLE will following the guidelines as detailed in this document.

STANDARDS

PLC Tag Naming Convention

Below is a list of basic standards related to HMI and PLC programming.

1. **PLC Tag Naming: (Max 32 characters)**:
   a. **PLC Tag naming convention**:
      i. **LXX_YYYY_ZZ.AAAAAABBB**: Pre-configured standard Cimplicity objects
      ii. **LXX_YYYY_ZZ_AAAAABBB**: Unique Cimplicity tags in a project. This may be completely unique points, or extra points associated with a piece of equipment that are outside of the ST standard that may be required for sequence or control
      iii. **LXX_YYYY_ZZ_AAAAABBB_CC** : Commands sent from the HMI to the PLC or PLC generated (soft) alarms.
         - LXX=location
         - YYYY=Equipment
         - ZZ=instance number for equipment
         - AAAAAA=Function Code (needs to be better defined, see template in design)
         - BB=instance number for tag
         - CC=I/O type; DI, DO, AI, AO,....
   - Examples:
     - Tagname in the PLC and Cimplicity using a pre-configured standard Cimplicity object:

       PLC : N09_ACU_01_RUNNING_DI
       HMI : N09_ACU_01.RUNNING

     - Tagname in the PLC and Cimplicity for a non-standard Cimplicity point:

       PLC: N09_AHU_01_HAH_DO (this is a Hydrogen Alarm High concentration room air purge command)
       HMI: N09_AHU_01_HAH

     - Tagname in the PLC and Cimplicity for commands and PLC generated (soft)

       PLC: N09_EFAN_01_MAINTENANCE_MODE_HMI
       HMI : N09_EFAN_01.MAINTENANCE_MODE_CMD

       In this circumstance, the _HMI suffix is used in the PLC to differentiate command source between the Cimplicity BMS and the Link Control Center (LCC) while _CMD is used in the HMI to denote the actual function of the point.

     - Alarms

       PLC: N09_EFAN_01_FAIL_TO_RUN_ALM
       HMI: N09_EFAN_01.FAIL_TO_RUN_ALM

2. **Tag Description: (Max 70 characters)**
   a. AAAA YYYY-ZZ Description
      i. AAAA=Station Abbreviation
      ii. YYYY=Equipment

iii. ZZ=instance number for equipment
iv. Description (Equipment being sensed=>Status name=>Status type),

b. Description to include station name abbreviation convention examples,
   i. ALS EF-02 Bearing high temperature alarm.
   ii. ALS EF-02 Running Status
   iii. ALS EF-02 Running Feedback
   iv. UWS EFAN-03 Fan running status.
   v. BHS AHU-01 VFD speed.
   vi. TLA/FLA Link Station abbreviation list:

Alignment	Link Extension	Contract	Facility Designation	Station / Facility Location	Facility Code

c. **Automated to create table of existing function abbreviations to assist with standardize these function descriptions and share with ST.**

3. **Tag Addressing**:
Numreical addressing to be based on 5 numerical digits, %RXXXXX, %AIXXXXX, %AQXXXXX, %DIXXXXX.....

4. **Tag Resource ID:**
Resource ID to be used for subsystem description
   a. BMS Resource ID
      i. HVAC
      ii. Lighting
      iii. Plumbing (sump pumps, heat trace, etc.)
      iv. Electrical (UPS, Inverter, power ...sub metering)
      v. BMS (PLC CPU and Card diagnostics, power supplies, PLC Comms, etc.)
      vi. Vertical Transportation (Elevators/Escalators)
      vii. Fire (FACP, Fire Alarm, fire protection, clean agent, Stairway Pressurization, fire smoke dampers)
      viii. Access Control (doors, gates, lockers, access cards,)
      ix. PA/VMS
      x. Comm (network)
   b. EVS Resource ID
      i. EVS (similar to BMS PLC)

ii. Fire (FACP, Emergency Fans/Dampers/starter/VFD,sensors, ...)
iii. PA/VMS (SCU, PA, VMS, ...)
iv. Electrical (Sub Metering, Emergency Fan Electrical)

PROGRAMMING

1. Tag naming and description and addressing shall follow same standard as listed above.
2. Calculation routines shall be explained in the comment section above the rung.
3. Each routine shall be commented. At least header with date, author, and description.
4. Commenting
5. No indirect addressing
6. Assigned addressing for all points.
7. All logic and alarming to be done in PLC not HMI
8. All changes or updates shall be shall be stated in comments for revision control
9. Runtime: Calculate and display equipment Yesterday, Today, and Total runtimes in hour's interval with manual reset capability on the Total runtimes when needed.
10. Runtimes: Display Equipment runtime and historically log the runtimes.

ALARMS

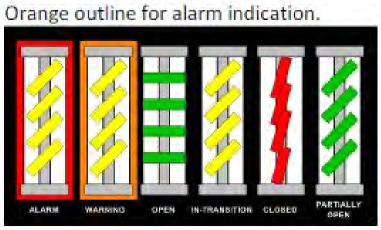
Alarm class (priority level), use five levels same as Rockwell Collins:
(NOTE: The use of "Active Operations" or "Operational" in the descriptions below implies train operations, not the operations of building or mechanical systems.)

1. **Critical (P1)**:
   (UnAck: Black Font /Red background
   Ack: Red/Black)
   Alarms indicating a potential Hazardous Condition resulting in injury or property Destruction without immediate action.
2. **Major (P2):** (Orange not available as a standard option)
   (UnAck: Black Font /Orange background
   Ack: Orange/Black
   Alarms indicating an adverse effect or potential adverse effect to Active Operations
3. **Minor(P3):**
   (UnAck: Black Font /Yellow background
   Ack: Yellow/Black)
   Operational alarms that are non-critical but provide information and indicate a potential problem if not addressed
4. **Informational(P4):**
   (UnAck: Black Font /White background .
   Ack: Aqua/Black)
   Alarms/Events that are needed for history and maintenance purposes that can be drilled down upon, but do not need to be seen by Operator
5. **Comm Fail:**
   (UnAck: Black Font /Fuchsia background
   Ack: Fuchsia/Black)
   Communication failure Alarms. Objects and area pertaining to comm fail to have fuchsia box around it with hatch inside.

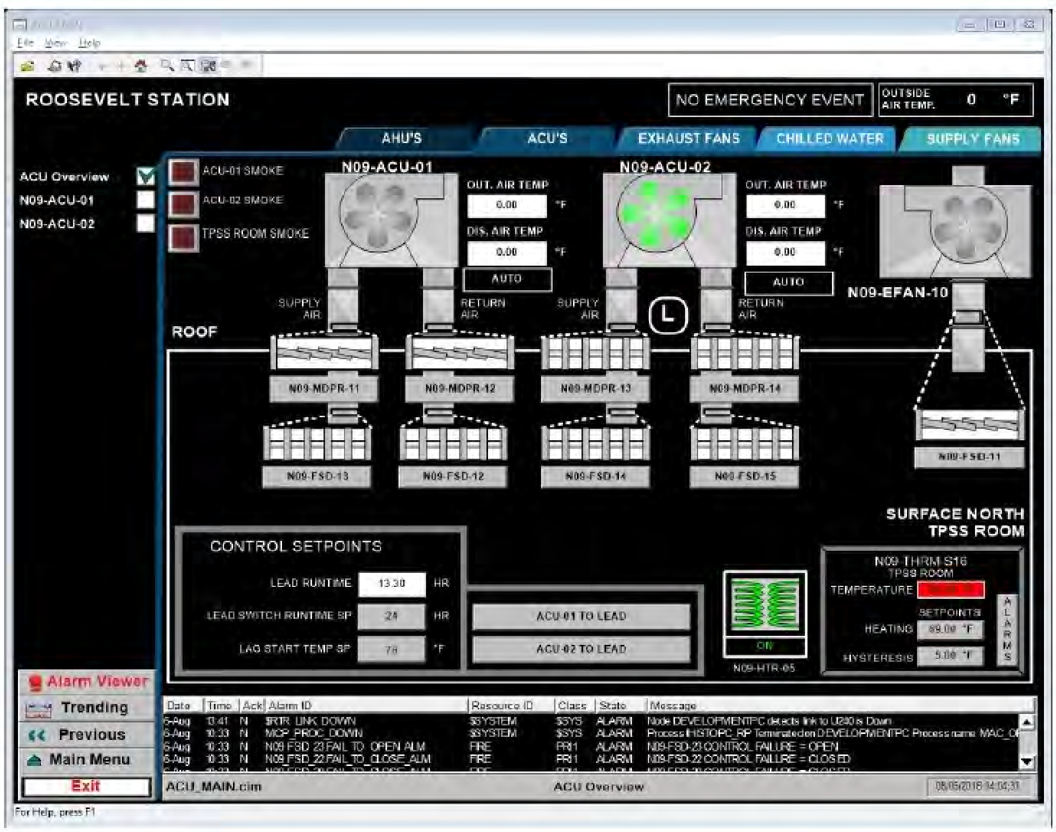
HMI GRAPHICS

1. All screens to have base template with header, navigation, alarming, screen name bar at bottom

2. List-style navigation to left of the navigation screen showing the geographic location of equipment
3. Overview screen to show just the important info as example shown below.
4. Standardize screen size for all (750x550). Current standards varies.
5. Contrast between text and background colors. Use of gradient with text on top should be avoided.
6. Standardize background colors: Black
7. Use integrated alarm screen at bottom of screen.
8. Limit use of scripting to run in background.
9. Font sizing (not smaller than size 8 font) –see screen NO3-ahu-09. Limit number of different size text on screens. Heading shall be size 14, subheadings 12 and all else 8.
10. Have list-style navigation to left of the screen showing the geographic location of equipment.
11. Fire Smoke Dampers: Green indicates Open, Red is Closed and Yellow is In-Transition with Red or Orange outline for alarm indication.



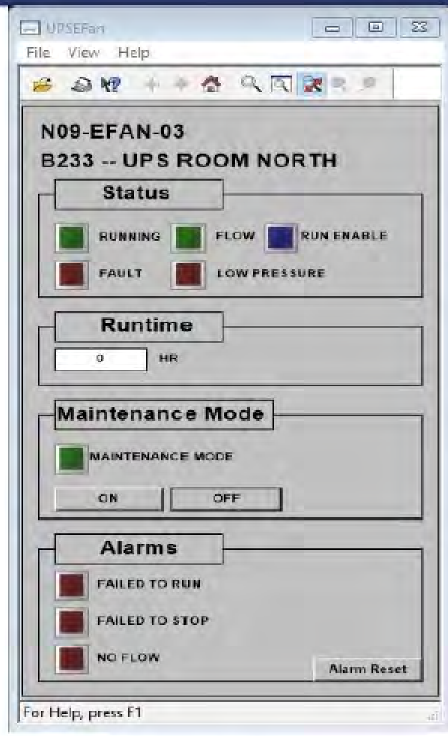
12. Control panel insets to have black background with a grey frame/outline.
13. HVAC related buttons to have a small bevel and grey background
14. Duct-smoke alarms to be locate in upper left
15. Smoke alarms to be located top left on every screen
16. Lighting Control override boxes and indications to match the Fire Override box for commands and status.
17. DID status boxes grey border with white text status and black background.
18. BMS Chassis-Architecture Screen to have black backgrounds with white text and grey outlines with status lights in the center.
19. All network connections to be Green for normal and Red for alarm or fault state.
20. DC Power Supply indications and commands match the Fire Override box for commands and status. Red is alarm, Yellow is unacknowledged and Green is normal
21. Use gray power lines for static lines.



22. Graphics Color Pallette:
    A. BMS
        - RUNNNING / ON / OPEN
        - CLOSED / ALARM
        - IN TRANSITION
        - CAUTION
        - COMMAND STATE = 1
        - STOPPED / OFF

    B. EVS:
        - ON / OPEN /EVACUATION DIRECTION
        - ALARM / EMERGENCY / CLOSED
        - EXHAUST (FWD RUN) / INTRANSITION
        - CAUTION
        - SUPPLY (REV RUN) / VENTILATION
        - STOPPED / OFF

23. Runtimes: Display Equipment runtimes.
24. Pop-ups: Equipment with control shall have pop-up based on the control description, for more details co-ordinate with ST Engineer.



25. ACU Overview Screen and General HVAC:
    a. Graphic thermostats that do not change or provide function, remove graphic and rely upon a labeled number-field only.
    b. Stairwell pressurization to be indicated by a labeled number-field only without the DPT graphic
    c. All control panel insets shall be black background with a grey frame/outline.
    d. All HVAC related buttons shall have a small bevel and grey background.
    e. Place equipment identification (i.e. ACU-01) under the piece of equipment.
    f. Place duct-smoke alarms in upper left for all screens, re-size equipment as appropriate.
    g. Static graphics to be in grey
    h. Located the instrument live information under the graphics symbol
    i. Indicate HOA status under the equipment identifier.
    j. Use SCADA Auto mode and SCADA Manual mode for SCADA related status.

26. Elevator/Escalators/Pumps Screens
    a. Provide status boxes and indications for all VT, Pump and Bike Locker screens,. Use HVAC pop-up windows as example.

27. Lighting Control Screen

a. Lighting Control override boxes shall match the Fire Override box for commands and status.
b. Revenue status to indicate SCADA Revenue Auto

28. Door Control Screens
a. DID status boxes shall be black background with grey border and with white text status.
b. MASTER UNLOCK function shall be located in the navigation area on the left (below any list-style or above main button navigation)

29. BMS Chassis-Architecture Screen
a. On PLC I/O check list description shall be dynamically populated based tag name description. (see page BMS002-slot 3)
b. All network connections Green for normal and Red for alarm or fault.

30. Power Screen

a. Power Supply indications and commands to match the Fire Override box for commands and status.

b. Color Scheme:

    i. Symbol: Red is alarm, Yellow is unacknowledged state and Green is normal

    ii. Wire: Red is energized, Grey no power, Yellow is Alarm state.

31. UPS Screen

a. In labeling, abbreviate Room North to RM North

b. For consistency with direction above, change yellow power lines to grey as it is not dynamic.

HISTORIAN CONFIGURATION AND TRENDING

Topic	**Notes**
Centralized Historian	Develop FCS for integration into centralized historian.
Tag Naming	Same standard as HMI and PLC
Datastores	Set up one BMS datastore per station and one EVS datastore per tunnel station. Ensure each station's local configuration supports.
Digital I/O	For BMS and EVS, historically log on change of state of status.
Analog I/O	Historically log the following BMS categories: • Temperature or thermostat AI every five minutes • VFD AI/AO every fifteen seconds when active • Photocell AI every five minutes Historically log the following EVS categories upon initiation: • Vibration continuously. • Winding temperatures every five seconds • Motor current every five seconds

Alarming	For BMS and EVS, historically log all alarms including acknowledgments.
Event	For BMS and EVS, historically log all status including start/stop, open/close, etc
Storage	Storage must accommodate a minimum of 5 years' worth of data. This is required locally until we change to a centralized historian.
Historian tools	Excel plug in and the web tool.

TRENDING:

1. Historical Trend: Trend all Analogs from project based historical database.
2. Real Time Trend: Trend all Analogs in real-time.
3. Use screen template to build trend screen with Alarm and screen info bar as shown above.
4. Customize trending may be needed during commissioning, co-ordinate with ST DECM and ST OT.

SOFTWARE VERSION CONTROL

a. ME 9.5 is being used to program NGLE's FCS, so this will be the new standard for updating ULINK and SLINK. CLINK will be different (TBD).
b. Cimplicity 9.5 is being implemented with NGLE and will be new standard for updating ULINK and SLINK.
c. GE iHistorian implemented with NGLE will be version 7.0. ULINK/SLINK are currently version 5.5.133.0.
d. Confirm software version details with ST OT before starting on the station programming.

IMPORTANT CONSIDERATIONS

1. Hardware & Software compatibility and consistency with the existing LINK system
2. Configuration of station/local networks
   a. Isolated I/O networks and HMI network to be on ST TCN network.
   b. Use Profinet for I/O network (PLCs to RIO) with ring configuration.
3. Bringing ULINK/SLINK into the fold as a future project.

EXHIBIT C
SECTION 25 60 00
ROCKWELL COLLINS ALARMS MESSAGE CONFIGURATION

GENERAL

The current BMS and EVS systems each use the same Rockwell Collins Alarm and Event processing kernel to generate alarm messages. The alarm and event processing provided by the Contractor shall follow the same configuration.

The alarm characteristics and priority for each alarm condition is specific to each system and is defined in the database of each system. Each alarm condition is configured with up to four (4) alarm priorities that define color, whether and acknowledgement is required, whether the alarm is defined as a major alarm or minor alarm.

- Priority 1 alarms major alarms, are reported visually and audibly at the Workstation, display red in color and require acknowledgement. Audible alarm shall be continuous until acknowledged.
- Priority 2 alarms major alarms, are reported visually display red in color and require acknowledgement.
- Priority 3 alarms minor alarms, are reported visually display yellow in color and require acknowledgement.
- Priority 4 alarms minor alarms, are reported visually display yellow in color and do not require acknowledgement.

In general, when the alarm is caused by a device with a graphical symbol on a display, the symbol will flash until acknowledged. It is planned that the TCS, BMS, and EVS alarms priority scheme shall follow the existing system alarm priority scheme as provided by Sound Transit.

BMS, and EVS event processing uses templates to create alarm text. The data specific to each alarm is substituted into the template at the time the alarm message is generated. In the follow examples, all items that are in red are example substitutions. The alarm mockups show how a subset of the alarm messages will be displayed in the workstation alarm summaries.

EXAMPLES PROVIDED ON NEXT PAGE

EXAMPLES

INITIALIZATION COMPLETE ON EVS1 IN GROUP EVS

⇒ Indicates that one of the EVS servers (EVS1) has completed its initialization.

SYSTEM FAILOVER INITIATED ON WKST1 IN GROUP BMS

⇒ Indicates that the user at workstation1 has initiated a server failover in the BMS group.

SYSTEM FAILOVER READY: TCS1 IS PRIMARY AND TCS2 IS BACKUP IN GROUP TCS

⇒ Indicates that there is a functional primary server (TCS1) and hot standby backup server (TCS2). The TCS system is in a state where one server can fail and not cause loss of operational status.

REJECTED LOGON BY USER SUPERV CONSOLE WKST1

⇒ User SUPERV has attempted to login to console WKST1 and failed to enter the correct password.

DEVICE1 CURRENT STATE = OPEN

⇒ DEVICE1 is in the state OPEN.

DEVICE1 UNCOMMANDED CHANGE = OPEN

⇒ DEVICE1 has changed state and is now OPEN. This device is not expected to change state on its own and was not commanded to change state.

⇒ The priority of this alarm will be set to the minimum priority (event) for all systems.

DEVICE1 CONTROL FAILURE = CLOSE

⇒ DEVICE1 was commanded to change state to CLOSE. The device status did not change to CLOSE after the (configurable) timeout time. The device is considered to have failed.

SYSTEM_ITEM IS DOWN ON SERVER1

⇒ The device, processor or application SYSTEM_ITEM has been detected to be in the DOWN state by the system on SERVER1. This alarm is used to track the state of system or system critical items.

NETWORK ETHERNET1 IS DOWN ON SERVER1

⇒ The network device named ETHERNET1 is in the state DOWN on the server named SERVER1.

This alarm is used to track network device status.

B.3 TCS ALARM MOCKUPS

SECTION 26 05 00

COMMON WORK RESULTS FOR ELECTRICAL

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for general electrical requirements that apply to other specification sections.

1.02 REFERENCES

A. This Section incorporates by reference the latest Authority Having Jurisdiction (AHJ) approved revisions of the following documents:

1. Institute of Electrical and Electronics Engineers (IEEE):

a. IEEE C2 National Electrical Safety Code (NESC).

b. IEEE 141 – Recommended Practice for Electric Power Distribution and Coordination of Industrial and Commercial Power Systems.

c. IEEE 242 – Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems.

d. IEEE 399 – Recommended Practice for Industrial and Commercial Power System Analysis.

e. IEEE 241 – Recommended Practice for Electric Power Systems in Commercial Buildings.

f. IEEE 1015 – Recommended Practice for Applying Low-Voltage Circuit Breakers Used in Industrial and Commercial Power Systems.

g. IEEE 1584 -Guide for Performing Arc-Flash Hazard Calculations.

2. National Electrical Contractors Association (NECA):

a. NECA NEIS 1 Standard Practice of Good Workmanship in Electrical Construction.

3. National Fire Protection Association (NFPA):

a. NFPA 70 National Electrical Code.

b. NFPA 70E Standard for Electrical Safety in the Workplace.

c. NFPA 110 Standard for Emergency and Standby Power Systems.

d. NFPA 130 Standard for Fixed Guideway Transit and Passenger Rail Systems.

4. State of Washington – Revised Code of Washington (RCW):

   a. 19.27 RCW Washington State Building Code.

   b. 19.28 RCW Electricians and Electrical Installations.

5. State of Washington – Washington Administrative Code (WAC):

   a. 51-50 WAC State Building Code Adoption and Amendments of the International Building Code.

   b. 296-45 WAC Safety Standards for Electrical Workers.

   c. 296-46B WAC Electrical Safety Standards, Administration, and Installation.

6. Local City and AHJ Electrical Code.

7. Local City and AHJ Building Code.

1.03 PERFORMANCE REQUIREMENTS

A. Seismic Design and Bracing:

1. Equipment provided shall meet seismic requirements specified in the AHJ-approved building code. Provide suitable bracing and anchorage and submit calculations performed and sealed by a structural engineer registered in Washington.

1.04 SUBMITTALS

A. Submit:

1. List of Materials: Submit a list of materials and equipment proposed for use. Give name of manufacturer, brand name, and catalog number of each item. Submit the list complete at one time, with items arranged and identified in numerical sequence by Specifications Section and Article numbers.

2. Seismic Bracing and Anchorage Calculations.

3. Compliance with Applicable Standards:

   a. Where equipment or materials are specified to conform to the standards of organizations such as ANSI, ASTM, IEEE, and NEMA, submit evidence of such conformance for review and record purposes.

   b. The label or listing of the specified agency will be acceptable evidence.

   c. Instead of the label or listing, the Contractor may submit a written certificate from an approved, nationally recognized testing organization, adequately equipped and competent to perform such services, stating that the items have been tested and that the units conform to the specified standard.

   d. Submit evidence of compliance to seismic safety requirements of the Washington State Building Code, local amendments, and the National Electrical Code.

4. Factory Test and Inspection Certification.

5. Shop Drawings: Submit shop drawings showing equipment layouts and fabricated work being provided under these Specifications. Submit such drawings before rough-in work, fabrication, and within ample time to prevent delays in the Work. Include electrical diagrams for equipment and equipment installation.

6. Field Test Reports: Submit certified field test reports of field tests, verifying compliance of equipment and systems with Specification requirements.

7. Operation and Maintenance Manuals: Submit operation and maintenance instructions and data for equipment provided under this Division as required by the contract. Include recommended maintenance materials and spare parts list for installed equipment.

8. Sound Transit Cover Fasteners Keys: Submit ten key bits as described in Article 2.01.B.3, in this specification.

B. Transmit:

1. Qualifications of professional engineer

1.05 QUALITY ASSURANCE

A. Qualifications: Ensure workers performing work meet the qualification and licensing requirements of Chapter 19.28 RCW.

B. Perform work in compliance with the following industry standards and regulations if applicable:

1. National Fire Protection Association:

a. NFPA 70 National Electrical Code.

b. NFPA 70E Standard for Electrical Safety in the Workplace.

c. NFPA 130 Standard for Fixed Guideway Transit and Passenger Rail Systems.

2. Institute of Electrical and Electronics Engineers, Inc. (IEEE):

a. IEEE 141 – Recommended Practice for Electric Power Distribution and Coordination of Industrial and Commercial Power Systems.

b. IEEE 242 – Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems.

c. IEEE 399 – Recommended Practice for Industrial and Commercial Power System Analysis.

d. IEEE 241 – Recommended Practice for Electric Power Systems in Commercial Buildings.

e. IEEE 1015 – Recommended Practice for Applying Low-Voltage Circuit Breakers Used in Industrial and Commercial Power Systems.

f. IEEE 1584 -Guide for Performing Arc-Flash Hazard Calculations.

g. IEEE C2 National Electrical Safety Code.

3. NECA NEIS 1, Standard Practice of Good Workmanship in Electrical Construction.

4. State of Washington Business Regulations and Administrative Codes.

5. Relevant amendments to Washington State regulations and codes adopted by local jurisdictions.

PART 2 - PRODUCTS

2.01 MATERIALS

A. General:

1. Furnish materials and equipment of design, sizes, UL listing (where UL standards exist), and ratings as indicated- suitable for the intended purpose.

2. Furnish materials and equipment acceptable to the authority having jurisdiction bearing label or classification listing of a nationally-recognized testing laboratory where product labeling or listing is available.

3. Methods of fabrication, assembly, and installation shall comply with specified Standards.

4. Provide products that are free from defects, which may impair performance, durability, or appearance.

B. Switches:

1. Provide ac, tumbler-type toggle switches conforming to minimum requirements of FS W-S-896, heavy-duty general use type.

2. Provide switches that operate in any position and are fully enclosed with entire body and cover of molded phenolic, urea, or melamine. Do not use fiber, paper, or similar flammable insulating material for body or cover.

3. Equip switches with metal mounting yoke with plaster ears, insulated from the mechanism and fastened to the switch body by bolts, screws, or other substantial means.

4. Provide the section of the yoke normally intended to bear on the surface outside the box with a minimum overall dimension of 3/4 inch, measured at right angles to the longitudinal axis of the yoke.

5. Use switch contacts of silver or silver alloy.

6. Use switches that are back or side wired with terminals of screw type or combination screw-clamp type.

7. Use terminal screws No. 8 or larger, captive or terminal type.

8. For use on lighting circuits, provide switches that are fully-rated for 20 A at 120 V or 277 V. Switches shall be gray color or as selected by Resident Engineer.

9. For control of resistive loads, switches may be snap-type as specified herein, of the proper rating up to 30 A at 120 - 277 V.

10. Provide 120 - 277 Vac snap switches capable of withstanding tests as outlined in FS W-S-896. If requested by Resident Engineer, submit evidence that the types of switches proposed have satisfactorily withstood these tests.

C. Receptacles:

1. Receptacle Standards: Ensure connector and outlet receptacles conform to FS W-C-596, heavy-duty general use type and NEMA WD6.

2. Convenience Receptacles:

   a. Provide receptacles with fire-resistant, nonabsorptive, hot-molded phenolic composition bodies and bases and with metal plaster ears integral with supporting member. Color shall be as indicated in the Contract Documents.

   b. Use receptacles that are 20R configuration, single- or duplex-type as indicated. Use receptacles that are back- and side-wired with screw or combination screw-clamp terminals.

   c. For contacts of the receptacles, including the grounding contact, use double-grip bronze type with spring steel backup clips so that both sides of each male prong of the plug will be in firm contact.

3. Locking-Blade Receptacles: NEMA WD 6, configuration subject to approval.

4. GFCI Receptacles:

   a. For ground fault circuit interrupter (GFCI) duplex receptacles use 120 V, 60 Hz, 20 A with built-in test and reset buttons and ground fault trip indicator.

   b. Ensure they interrupt the circuit within 1/30 second on a 5 mA earth leakage current.

   c. Receptacles shall also trip if the receptacle is incorrectly wired or if the ground-fault sensing/tripping unit fails.

   d. Provide devices designed for end-of-run installation or with provisions for feeding through to protect other outlets on the circuit. Circuit capacity for feeding through shall be 20 A.

   e. Provide receptacles with clamp-type terminals, mounting screws, and instructions.

5. Wallplates:

   a. Provide multi-gang plates where required. Segmented wallplates are not acceptable.

   b. Finished Area Device Covers: Brushed stainless steel, 0.040-inch thickness.

   c. Utility Area Device Covers: Raised, galvanized steel

   d. Exterior and Wet Location Cover:

      1) NEC-compliant "while-in-use" cover.

      2) Heavy-duty, die-cast aluminum, powder coated.

      3) Listed for wet locations, rated NEMA 250 Type 3R, with neoprene gasket.

4) Padlockable.

5) Depth: Minimum 3-1/4 inches.

e. Damp Location Cover: Die-cast, copper-free aluminum listed for wet locations with self-closing spring door and rubber gasket.

2.02 SOURCE QUALITY CONTROL

A. Factory Test and Inspection Certification:

1. Where factory tests and inspections for materials and equipment specified in referenced documents are waived, submit certified copies of reports for tests performed on previously manufactured identical materials or equipment within the previous 12 months for review and approval.

2. Accompany test reports by signed statements from the manufacturer certifying that the previously tested material or equipment is physically, mechanically, and electrically identical to that proposed for the Contract. Include wiring and control diagrams.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install products in accordance with product listings, manufacturer’s recommendations, relevant codes and regulations, and standard industry practice for electrical installations.

B. Install electrical materials, equipment, appurtenances, and accessories in locations as indicated, in accordance with NECA NEIS 1, to provide a complete and operable system. Do not weld electrical materials for attachment or support.

C. Provide anchor bolts and anchorage items as required, and field check to ensure proper alignment and location. Provide templates, layout drawings, and supervision at the jobsite to ensure correct placing of anchorage items in concrete. Check embedded items for correctness of location and detail before concrete is placed.

D. Install supporting members, fastenings, framing, hangers, bracing, brackets, straps, bolts, and angles as required to set and connect the work rigidly.

E. Conform to the seismic restraint requirements of the AHJ-approved Building Code and Washington State Building Code.

F. Ensure electrical equipment installed under these Specifications conforms to the AHJ-approved Building Code and the International Building Code Section 1621, Architectural, Mechanical, and Electrical Component Seismic Design Requirements.

G. Control erection tolerance requirements so as to not impair the strength, safety, serviceability, or appearance of the installations.

H. Install switches, receptacles, special purpose outlets, and cover plates complete in accordance with NECA NEIS 1, the National Electrical Code, and local electrical codes.

I. Seal equipment enclosures against dust, whenever dusty conditions are present inside the rooms or outside, during the construction period.

3.02 CONSTRUCTION

A. Wallplate Type Requirements:

1. Public areas: Provide Finished Area device covers.

2. Non-Public areas: Provide Utility Area wallplates in ancillary spaces, mechanical rooms, fan rooms, electrical closets, electrical rooms, traction power substations, and unfinished areas.

3. Special purpose outlets: Provide Finished Area device covers of a design for the particular application.

4. Exterior and wet locations: Provide specified exterior and wet location while-in-use covers.

5. Damp locations: Provide specified damp location covers.

B. Wiring:

1. Provide wiring systems complete as indicated and required for proper service. Provide ample slack wire for motor loops, service connections, and extensions. In outlet or junction boxes provided for installation of equipment by others, insulate and protect ends of wires and cables and install blank covers.

C. Wiring Devices and Wall Plates:

1. Locate wiring devices at heights in accordance with NECA 1, except as otherwise indicated.

2. For exterior and damp locations including passenger stations, mount receptacles in watertight cast metal outlet boxes with threaded hubs or bosses.

3. Provide water-tight, locking-type male plugs protected by a ground-fault circuit interrupter for equipment subject to spray or hose cleaning.

4. Provide GFCI duplex receptacles where indicated.

5. Provide wallplates for each switch, receptacle, and special purpose outlet.

D. Interface With Other Work:

1. Coordinate the Work of this Section with the Work of others, as required to provide a complete and operable electrical installation.

2. Coordinate electrical services and Work with the serving utility company and Sound Transit, as applicable.

3. Coordinate with Work completed or in progress or to be performed under other Sections of these Specifications or by other contractors.

   a. Make indicated connections to previously completed work.

   b. Where future connections to or extensions of the work are indicated, provide safe and convenient provisions for such future connections and extensions.

END OF SECTION

SECTION 26 05 33

RACEWAY, BOXES, HANGERS AND SUPPORTS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for furnishing and installing electrical raceways, underground electrical conduits, duct banks and utility structures, and equipment supports including conduit, duct and cable tray, outlet, junction and pull boxes, and electrical and communications distribution cabinets.

B. See Division 33 specifications for requirements for utilities electrical manholes and vaults. See Division 31 specifications for requirements for earthwork trenching and backfill.

1.02 REFERENCES

A. This Section incorporates by reference the latest revision of the following documents:

1. American National Standards Institute (ANSI):

a. ANSI C80.1 Electrical Rigid Steel Conduit (ERSC).

2. ASTM International (ASTM):

a. ASTM C33/C33M Standard Specification for Concrete Aggregates.

b. ASTM A123/A123M Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.

c. ASTM A153/A153M Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.

d. ASTM D1248 Standard Specification for Polyethylene Plastics Extrusion Materials for Wire and Cable.

e. ASTM D3035 Standard Specification for Polyethylene (PE) Plastic Pipe (DR-PR) Based on Controlled Outside Diameter.

3. National Electrical Contractors Association (NECA):

a. NECA NEIS 1 Standard for Good Workmanship in Electrical Contracting.

4. National Electrical Manufacturers Association (NEMA):

a. ANSI/NEMA FB 1 Fittings, Cast Metal Boxes, and Conduit, Electrical Metallic Tubing, and Cable.

b. NEMA FG 1 Fiberglass Cable Tray Systems.

c. NEMA RN 1 Polyvinyl-Chloride (PVC) Externally Coated Galvanized Rigid Steel Conduit and Intermediate Metal Conduit.

d. NEMA TC 2 Electrical Polyvinyl Chloride (PVC) Conduit.

e. NEMA TC 3 Polyvinyl Chloride (PVC) Fittings for Use with Rigid PVC Conduit and Tubing.

f. NEMA TC 13 Electrical Nonmetallic Tubing (ENT).

g. NEMA TC 14 Reinforced Thermosetting Resin Conduit (RTRC) and Fittings.

h. NEMA VE 1 Metal Cable Tray Systems.

i. NEMA 250 Enclosures for Electrical Equipment (1000 Volts Maximum).

5. National Fire Protection Association (NFPA):

a. NFPA 70 National Electrical Code.

b. NFPA 130 Standard for Fixed Guideway Transit and Passenger Rail Systems.

6. Underwriters Laboratories Standards (UL):

a. BSR/UL 2024 Standard for Signaling, and Communications Raceways and Cable Routing Assemblies.

b. UL 1653 UL Standard for Safety Electrical Nonmetallic Tubbing.

1.03 SUBMITTALS

A. Submit the following:

1. Shop Drawings:

a. Provide shop drawings showing the exact location and arrangement of conduits, cabinets, and pull-boxes installed under this contract.

b. Provide shop drawings for fabrication and installation of precast concrete structures, cast-in-place concrete structures, and concrete-encased underground ductwork, including the following:

1) Excavation and shoring plans with required structural calculations signed and stamped by a professional engineer registered in the state of Washington.

2) Cast-in-place and precast detailed steel reinforcement drawings.

3) Details of reinforcing steel used to tie duct bank to rigid underground structures it enters.

4) Cast-in-place and precast manufacturer's concrete mix designs for structures and colored concrete as indicated.

5) Dimensions and details of structure.

6) Vault covers, including inscription.

c. Shop drawing information may be combined on a single drawing if clarity is not thereby impaired.

d. Submit shop drawings which fully demonstrate that the work to be performed and the materials to be provided comply with the provisions of these Specifications.

2. Conduit Fill Calculations:

a. Provide conduit fill calculations for every conduit / conductor combination scheduled on the Contract Drawings or otherwise required to be installed for this project.

b. Utilize actual conduit interior dimensions obtained from submitted product data complying with this Specification and conductor areas obtained from product data submitted under low-voltage electrical power conductor and cables requirements as required by the Contract as the basis for these calculations.

c. Calculations shall demonstrate that the intended conduit type / size shall provide 20 percent surplus capacity for the installation of future conductors. For instance, in cases where the NEC conduit maximum fill percentage is 40 percent, the 20-percent surplus capacity would equate to a maximum 33 percent conduit fill.

d. Calculations shall be provided for review prior to the scheduled installation of any conduit, to facilitate review. Calculations shall be reviewed and approved by Sound Transit prior to the installation of any conduit and wiring.

B. Transmit the following:

1. Provide a list of five (5) major projects for which similar products have been supplied, which have been in satisfactory use or operation for the past five (5) years.

2. Product Data:

a. Provide product data for each type of material specified and proposed for use. Indicate the name of manufacturer, brand name, and catalog number of each item. Transmit the list complete at one time, with items arranged and identified in numerical sequence by Contract Specifications Section and Article numbers.

b. Manufacturers' specifications and other data required to demonstrate compliance with these Specifications:

1) Catalog cuts for the following products:

a) Raceways.

b) Duct bank tie-downs.

c) Underground duct system including manholes, pull boxes, conduit spacers, handholes, cable junction boxes, and termination boxes.

d) Manhole, pull box, and handhole covers and frames.

e) Related miscellaneous hardware and metal items for cable trenches and wireways.

f) Trench and wireway covers including composition of

Fiberglass Reinforced Plastic materials, divider partition panels, method of joining sections, expansion joint mounting, and support details.

3. Compliance with Applicable Standards:

a. Where equipment or materials are specified to conform to the standards of organizations such as ANSI, ASTM and NEMA, submit evidence of conformance. The label or listing of the specified agency will be acceptable evidence.

b. Instead of the label or listing, the Contractor may submit a written certificate from an approved, nationally recognized testing organization, stating that the items have been tested and that the units conform to the specified standard.

c. Accompany test reports by signed statements from the manufacturer certifying that the previously tested material or equipment is physically, mechanically, and electrically identical to that proposed for the Contract.

1.04 QUALITY ASSURANCE

A. Qualification of Manufacturers:

1. Select manufacturers of the products specified for work under this Section who are in the business of manufacturing similar products and are able to provide a history of successful production of the specified products.

2. Inspection: Ensure completed facilities are approved by the Resident Engineer before installation of cable and equipment. Perform corrective work at no additional cost to Sound Transit.

1.05 DELIVERY, STORAGE AND HANDLING

A. Accept materials on site in original factory packaging, labeled with manufacturer's identification.

B. Protect from weather and construction traffic, dirt, water, chemical, and mechanical damage, by storing in original packaging.

PART 2 - PRODUCTS

2.01 MATERIALS

A. Precast concrete electrical boxes, pull boxes, and vaults:

1. Reinforce concrete in a manner which is regularly provided in standard products of the manufacturer.

2. Standard manufactured structures which meet project requirements will be acceptable.

3. Provide concrete inserts for mounting cable support brackets as indicated.

4. Provide pull box covers with two lifting eyes and two hold-down bolts.

5. In public and/or non-secure spaces, security shall be integrated in items including, but not limited to, electrical boxes, pull boxes, and vaults.

B. Cast-In-Place Concrete for Duct bank Encasements, Manholes, Pull Boxes, and Vaults

1. Concrete: 3000 pounds per square inch with 4-inch slump in accordance with Portland cement concrete as required by the Contract.

2. Red concrete: Portland cement concrete, using 100 pounds of iron oxide for 8 cubic yards of concrete, as required by the Contract.

3. Frames, Covers, Gratings, Steps and Sumps: Provide as indicated and in accordance with Systems Standard Drawings and Contract Drawings.

4. Cover Identification: Provide covers with embossed or engraved identification as indicated and in accordance with as required by the Contract.

5. In public and/or non-secure spaces, security shall be integrated in items including, but not limited to, pull boxes, manholes, and vaults.

6. In Manholes: Provide sump hole 1ft x 1ft for dewatering tasks.

C. Sand:

1. Clean, graded, washed, passing a No. 4 U.S. sieve, and conforming generally to ASTM C33/C33M for fine aggregate.

D. Warning tape:

1. Heavy gage, yellow, detectable plastic for direct burial, material resistant to corrosive soil, 6-inch minimum width, minimum 4 mils thick.

2. Print with warning that an electrical duct bank is located beneath the tape.

3. Install warning tape 12 inches below finished grade.

E. Duct bank tie-down:

1. Non-metallic rod or stake with sufficient friction to prevent ducts from pulling rod out of ground and “floating” when concrete is placed.

F. Raceway Supports:

1. Conduit clamps for individual conduit supports shall be one hole, galvanized heavy gauge steel, or galvanized malleable iron with clamp back. Channels, fittings and conduit racks shall be as specified in this Section.

G. Channels and Fittings:

2. Hanger rods shall be high tensile strength galvanized carbon steel or electro-galvanized and zinc chromate coated steel with free running threads, 3/8 inch minimum.

3. Channels and channel fittings, clamps and accessories shall be hot-dip galvanized, 12-gauge steel with holes 1-1/2 inch on center.

4. Channels shall be 14 gauge minimum, 13/16 inch or 1-5/8 inch deep by 1-5/8 inch wide minimum.

5. Beam Clamps: Malleable Iron, with tapered hole in base and back to accept either bolt or hanger rod. Set screw: hardened steel.

6. Where heavy-duty racks are called out, channel shall be 12 gauge single or double 1-5/8 inch deep by 1-5/8 inch wide.

7. Aluminum, light gauge or low-strength metals or materials shall not be used.

8. Channel System Manufacturer: Unistrut, Powerstrut, Cooper B-line, Steel City, or approved equal as approved by Resident Engineer.

F. Anchors

1. Anchors shall be provided with sufficient strength to support four times the load as follows:

a. For hollow masonry, toggle bolts or masonry expansion anchors shall be used.

b. For solid masonry, brick, or pumice block, masonry expansion anchors shall be used.

c. For metal, machine screws, bolts, or welded studs with nuts and lock washers shall be used.

d. For wood, wood or sheet-metal screws shall be used.

e. For concrete, wedge type expansion anchors shall be used. Approved Product: Phillips Red-Head, Fastenal, or approved equal as approved by Resident Engineer.

2. Powder driven anchors or studs are prohibited for all applications.

3. Epoxy anchors are prohibited for all applications unless approved by Resident Engineer.

G. Fasteners and Hardware:

1. Fasteners and hardware shall be suitable for the use and environment intended. All fasteners shall be corrosion resistant. Plated steel fasteners may be used indoors, in dry locations, only. Unplated steel shall not be used.

2. Stainless steel fasteners shall be used in manholes, handholes, trenches and splice boxes, where exposed to weather, or in damp or wet locations. Bolted connections shall be made using lock washers.

H. Corrosion Control:

1. Material and equipment shall be designed to ensure satisfactory operation and life in the environmental conditions that exist where the material or equipment is installed.

2. Wherever “galvanized” or “hot-dip galvanized” is called out in this Section of the Specification, the material shall be coated in accordance with ASTM A123/A123M. Galvanneal finish is an acceptable alternative to hot-dip galvanizing of sheet or structural steel if cut edges are protected from corrosion. See Division 5 for shop applied coatings.

3. Wherever materials are called out as “hot-dip galvanized” or “galvanized”, the coating is intended to be applied in addition to normal manufacturer’s finish. Some materials or products specified, which are not readily available in the specified hot-dip finish, shall be “custom” hot-dipped after manufacture by an independent galvanizer. Where finishes are called out as galvanized and the specified product cannot be either manufactured with a hot-dip finish, or cannot be hot-dip galvanized after manufacture, the specified product shall be furnished with a finish that will perform equal to hot-dip galvanized as approved by Sound Transit.

K. Conduit and Duct:

1. Electrical Rigid Steel (Galvanized Rigid Steel – GRS) Conduit and Accessories: ANSI C80.1; hot-dip galvanized inside and out after threading; each length shall bear UL label:

    a. Fittings and Accessories:

        1) Bushings: Nylon-insulated, metallic, grounding type.

        2) Sealing Bushings

            a) Galvanized malleable or ductile iron bushings with Bakelite sealing and pressure discs and individual neoprene cable rings.

            b) Bushings shall seal ends of GRS conduit against the entrance of water, air or dust around emerging cables.

            c) Acceptable Manufacturer, Product: O/Z/Gedney, type KR or approved equal as approved by Resident Engineer.

        3) Conduit straps, clamps, and clamp backs: Galvanized malleable iron.

2. PVC-Coated Galvanized Rigid Steel Conduit (PVC/GRS): NEMA RN 1, with corrosion resistant internal coating.

    a. Shipping: Thread protectors installed on both ends of conduit, with couplings packaged separately.

3. PVC Electrical Conduit and Fittings:

    a. NEMA TC 2, EPC-40-PVC; heavy wall, high impact strength, rigid PVC.

    b. Fittings: NEMA TC 3, EPC-40-PVC.

    c. NEMA TC 2, EPC-80-PVC; heavy wall, high impact strength, rigid PVC for underground applications

    d. Fittings: NEMA TC 3, EPC-80-PVC.

4. Epoxy and Phenolic Fiberglass Conduit and Fittings: NEMA TC 14; standard-wall and extra wall (XW):

    a. Conduit joints and fittings: Tapered or untapered; all of one type.

5. Liquidtight Flexible Metallic Conduit and Fittings:

    a. Core: Flexible galvanized steel with a continuous copper bonding conductor spiral wound between the convolutions.

b. Jacket: Extruded liquidtight plastic or neoprene; moisture- and oil-proof, capable of conforming to the minimum radius bends of flexible conduit without cracking; self-extinguishing with low halogen containing material.

c. Fittings: Zinc-coated.

6. Electrical Nonmetallic Tubing (ENT) and Fittings:

a. Listed UL 1653 and NEMA TC 13.

b. Fittings and outlet boxes shall be from the same manufacturer as ENT.

c. Outlet boxes shall be capable of supporting 50 pounds.

d. Mud boxes shall have threaded brass inserts.

7. Conduit Expansion Fittings:

a. Factory installed packing ring, designed to prevent the entrance of moisture.

b. Pressure ring.

c. Grounding ring or a grounding conductor for metallic expansion couplings.

d. Use fittings which maintain a constant inside diameter in every position and provide a smooth wireway for protection of wire insulation.

I. Innerduct:

1. Smooth-wall HDPE innerduct, SD 13.5, meeting dimensional requirements of ASTM D3035 and material requirements of ASTM D1248.

2. Nominal size: 1 inch, orange exterior color.

3. Couplings: Pneumatic couplers specifically made for fiber blowing and capable of withstanding a pressure of 125 psi.

4. Innerduct Sealing Plugs: High-impact, water-tight and gas-tight with elastic gaskets for sealing off innerduct after installation and proof-testing. Provide with end-to-end mule tape pull string.

5. Carlon, Pyramid, Duraline or approved equal as approved by Resident Engineer.

J. Galvanized Steel Field Coating:

1. Organic cold galvanizing coating: minimum 95 percent metallic zinc by weight in dried film; manufactured by ZRC Products Company, or approved equal as approved by Resident Engineer.

K. Oxide Inhibiting Joint Compounds:

1. Petroleum-based compound with evenly suspended zinc particles.

2. Burndy “Penetrox A” or approved equal as approved by Resident Engineer.

L. Conduit Trapeze Hangers and Framing Channel:

1. Hangers:

a. Two or more steel hanger rods, a steel horizontal member, U-bolts, clamps, and other attachments as necessary for securing hanger rods, and conduits.

b. Capable of supporting a load equal to the sum of the weights of the conduits and wires, the weight of the hanger itself, plus 200 pounds.

c. Steel hanger rods: Galvanized, not smaller than 3/8-inch diameter, threaded either full length, or for a sufficient distance at each end to permit at least 1-1/2 inches of adjustment.

d. Horizontal member:

1) Structural grade steel, 1-1/2 by 1-1/2 inches or 1-5/8 by 1-5/8 inches, 12 gage, cold-formed, lipped channel, designed to accept special spring-held hardened steel nuts for securing hanger rods and other attachments. Ensure nuts and clamps are compatible with the channel.

2) Two or more channels may be welded together to form horizontal members of greater strength.

3) Hot-dip galvanized after fabrication in accordance with ASTM A123/A123M or ASTM A153/A153M, as applicable.

4) Manufacturer: Unistrut or approved equal as approved by Resident Engineer.

M. Cable Trays:

1. Metal Cable Tray: NEMA VE 1, except for modifications indicated:

a. Components: Hot-dip galvanized steel in accordance with ASTM A123/A123M, or stainless-steel Type 304 or Type 316, as indicated.

b. Fiberglass cable tray: NEMA FG 1.

c. Dimensions: Use trays with a width of 6 inches minimum and a loading depth of 3 inches minimum. Use trays with an inside nominal depth of 5 inches minimum. Use curved fittings with a 24 inches minimum curve radius, unless otherwise approved by the Resident Engineer.

d. Type: Ladder type or solid bottom type with solid covers, as indicated.

e. Performance Requirements:

1) Verify the cable tray system is capable of supporting a total cable load of 55 pounds per linear foot for cable tray of 30 inches wide or less and 88 pounds per linear foot for cable tray over 30 inches wide on a maximum span of 8 feet including a static concentrated load of 200 pounds as specified below, with a safety factor of two based on the destructive load, regardless of the type of splice plates or type of span, when tested in accordance with load test procedure specified in NEMA VE 1.

2) Ensure that straight sections and fittings don’t permanently deform under a 200-pound static concentrated load applied vertically along a 4-inch length for both of the following conditions:

3) Load applied to center of one tray section having specified cable load and support spacing. Apply load at midpoint between supports over a splice connection.

4) Load applied to one rung of empty tray section having specified support spacing. Locate the load at midpoint between side rails and supports.

2. Cable Tray Supports:

a. Capable of carrying a working load of 100 pounds per linear foot, with a safety factor of 3.0 when loaded in accordance with NEMA VE 1, Section 3, and tested in accordance with NEMA VE 1, Section 4.

b. Manufactured or fabricated in accordance with the cable tray manufacturer's recommendations.

N. Outlet Boxes, Junction and Pull Boxes:

1. Provide electrical boxes of the material, finish, type, and size indicated and as required for the location, kind of service, number of wires, and function.

2. Not all junction boxes are shown on the plans. Junction boxes and pull boxes shall be installed as necessary by the contractor to aid in pulling wire, and to be in conformance with NFPA 70. There shall not be more than a total of 270 degrees of conduit bends between pull points per Sound Transit criteria. Contractor is to coordinate the location of the junction boxes and pull boxes with other trades to ensure that the boxes will remain accessible after all construction is complete.

3. Provide boxes complete with accessible covers designed for quick removal and suitable for the purpose for which they will be used, except that boxes in which, or on which, no devices or fixtures are to be installed shall be equipped with flat or raised blank covers as required. All Junction and pull boxes with covers in publicly-accessible areas shall use tamper-resistant screws. See common work results for electrical as required by the Contract..

4. For boxes below 100 cubic inches in size or boxes for embedment in concrete use cast metal. Conform to the requirements for cabinets for boxes over 100 cubic inches in size, except when boxes in interface pull boxes are cast metal with gasketed cast metal covers. Use Type FD boxes for surface mounted wiring devices.

5. Pedestrian type junction boxes shall be used for applications that require a junction box to be embedded in floor concrete or grade. The junction boxes shall be designed to be mounted in sidewalks and other flat concrete surfaces. The boxes shall have checkered covers and be made to withstand pedestrian traffic. These boxes shall be provided with a flat, neoprene gasket, attached to the cover. This box shall be cast iron and the finish shall be hot dip galvanized. Cover shall be secured with tamperproof, uniquely-keyed stainless steel cover screws as described in common work results for electrical requirements as required by the Contract..

6. Ensure covers are the same thickness as boxes and are secured in position by means of No. 10-24 stainless steel machine screws set in recessed cover holes. Arrange covers to be readily and conveniently removed.

7. Ensure junction boxes are galvanized inside and outside. Where outlet boxes are used as junction boxes, do not use boxes smaller than 4 inches square by 1-1/2 inches deep. Provide such boxes with flat blank covers.

8. For exposed installation, use outlet and switch boxes made of cast metal, not smaller than 4 inches square by 2-1/8 inches deep.

9. Conduit bodies: Cast metal access pull and junction boxes: ANSI/NEMA FB 1, hot dipped galvanized cast iron, or electro-plated zinc cast iron, or stainless steel with gasketed cover.

10. Provide brackets, supports, hangers, fittings, bonding jumpers, and other installation accessories as required.

11. Provide neoprene gaskets 1/8-inch thick for boxes subjected to weather.

12. Ground each box as specified in grounding and bonding for electrical systems requirements, as required by the Contract.

13. Boxes for systems control and communications applications shall be stainless steel (grade 316) conforming to NEMA 250 Type 4X and shall be provided with appropriate labels.

14. All boxes for use in train ROW, exterior areas, exterior and interior non-conditioned spaces, and below grade (interior/exterior) areas shall be stainless steel, conform to NEMA 250 Type 4X (grade 316) and shall be labeled accordingly.

15. All junction boxes for use in conditioned interior areas shall be rated NEMA 12.

16. All junction boxes for use in escalator and elevator pits shall be NEMA 4X stainless steel (grade 316).

17. Coordinate location of boxes with equipment placement. Junction boxes shall be accessible for maintenance.

O. Enclosures:

1. Stations:

a. Comply with NFPA 70 and NFPA 130 for appropriate enclosure type for protection based on environmental conditions.

b. Exposed public areas subject to hose-down and splashing water shall be NEMA 4X stainless steel (grade 316).

c. NEMA 12 for indoor use in non-public areas.

d. Nonmetallic enclosures shall not be used.

2. Parking Garages:

a. Outdoor boxes shall be rated minimum NEMA 3R. Areas subject to hose-down and splashing water shall be NEMA 4X stainless steel (grade 316).

b. Comply with NFPA 70 for appropriate enclosure type for protection based on environmental conditions.

c. Stainless steel and plastic enclosure may be used. Plastic enclosures shall be made from a UV-stabilized polycarbonate.

P. Cabinets:

1. Cabinet Boxes: Galvanized (dry indoor locations) or NEMA 4X stainless steel (grade 316) (exterior and damp/wet locations), size as noted on Contract Drawings. Provide white, galvanized steel interior mounting panel for mounting terminal blocks and relays in interface terminal cabinets, or where otherwise required.

2. Cabinet Fronts: Steel, surface or recessed type as required for the application with continuous hinge and flush lock. Supply locks for cabinets from a single manufacturer with standard key blank that are field-keyable.

3. Electrical Service and Distribution Cabinets: NEMA 4X stainless steel (grade 316) with non-directional brushed finish and accessories shown on Contract Drawings. Provide metering provisions meeting the requirements of the serving electric utility for Service Cabinets or switchboard metering sections. Provide lock mechanism as required above.

Q. Cover Security in Public and/or Non-secure Spaces:

1. In public and/or non-secure spaces, security shall be integrated in items including, but not limited to, outlet boxes, junction boxes, pull boxes, and cabinet covers. Exception: In public areas that are secure during non-revenue hours, this requirement applies only to elements installed at an elevation lower than 10 feet above finished floor.

2. All boxes, enclosures, and cabinets shall have hardware and/or threading to accommodate the appropriate tamperproof, uniquely keyed fastener.

3. Cover fasteners shall be tamperproof, uniquely keyed for Sound Transit fasteners. The fastener shall be stainless steel and shall have the ability to repel locking pliers. The key shall be nonsymmetrical, custom, and unique to Sound Transit. Fastener key heads shall match existing Sound Transit keyed fasteners.

4. Provide Sound Transit with ten 1/4-inch hex drive key bits. (Bryce Key-Rex Fastener with Raptor Claw option or approved equal as approved by Resident Engineer.)

5. Provide covers with two tamperproof fasteners, or more as required.

6. Covers for boxes, enclosures, and cabinets in pedestrian areas shall have recessed areas for tamperproof fasteners.

PART 3 - EXECUTION

3.01 PREPARATION

A. Before beginning construction or installation of a section of underground conduit or ductwork, verify that the site is in suitable condition for installing conduit or ductwork as indicated.

3.02 EXCAVATION, TRENCHING AND BACKFILLING

A. Perform excavation, bedding, and backfilling for underground conduits and structures as stated elsewhere in the Contract Documents.

3.03 CONSTRUCTION

A. General Requirements:

1. Install electrical raceway, boxes and accessories in locations as indicated, in accordance with NFPA 70, (parking garages), NFPA 130 (stations and guideway), NECA NEIS 1 and manufacturer's instructions, to provide a complete and operable system.

2. Ensure conduit, support fittings, boxes and conduit fittings are of compatible materials that will not corrode when subjected to moisture or standing water.

3. Provide anchor bolts and anchorage items as required, and field check to ensure proper alignment and location.

4. Install conduit to avoid conflicts with other work. Install horizontal raceways close to the ceiling or ceiling beams and above water or other piping wherever possible. Conduit shall be installed concealed from public view.

5. Install metallic conduit such that it will not be in contact with standing water, wet weather or station hose-down cleaning activities.

B. Duct Banks:

1. Group individual conduits together to form a duct bank in conformance with the requirements as specified.

2. Inspect ducts and couplings to ensure that only clean and undamaged pieces are incorporated in the work.

3. Install ducts, joints, and use manufactured space separator assemblies according to manufacturer's printed instructions and recommendations.

4. Do not use spacers or space separators which transmit any vertical load to the conduit.

5. Install duct banks or conduits with a minimum slope of 3 inches to each 100 feet away from buildings and towards manholes, pull boxes, and handholes.

6. Terminate conduits and ducts in end-bells in vaults.

7. Where duct bank enters rigid underground structures, provide reinforcing steel to tie the duct bank to the structure.

8. Construct the concrete-encased duct bank with 3-inch minimum concrete cover on all sides.

9. Protection: when installation of conduits and ducts is temporarily suspended or terminated, close ends of ducts with caps or plugs fitted to prevent entry of water or debris. Use caps or plugs designed for that purpose by the conduit manufacturer.

10. Mandrelling: As each section of a duct line is completed between manholes, handholes, or pull boxes, use testing mandrel and brush to clear ducting:

    a. For installations within the jurisdiction of Seattle City Light, perform mandrelling per the 2017 Seattle City Light Construction Standard, Standard Number U2-11.40/NDK-40.

b. For installation in other jurisdictions:

1) Draw mandrel not more than 1/4 inch less than the size of the conduit through each conduit, after which draw a brush with stiff bristles through until the conduit is clear of particles of earth, sand, or gravel.

2) Install conduit caps or plugs immediately thereafter.

3) Submit a written report providing a conduit identification number, size, material, location, the type and size of mandrel used, and indicate whether the conduit is tagged. Indicate on the report the acceptance date and the Contractor’s foreman.

11. Install 1/8 inch or larger diameter polypropylene pulling cord in ducts including innerducts. Ensure accessibility for conduits with threaded caps, or fasten each cord to pull iron anchorage in pull box, manhole, or vault with 2 feet minimum slack.

12. Maintain at least 1-1/2 inches of space between raceways for signal / communications duct banks and 3 inches for power.

13. Set duct banks on undisturbed earth or compacted fill.

14. Maximum of 16 raceways will be permitted in any one (1) duct bank where terminated in a single handhole or manhole.

C. Precast Concrete Structures:

1. Install precast electrical boxes, pull boxes, handholes, manholes, and vaults as indicated.

2. Manholes and handholes shall be of the precast type, complete with cable supports and pulling irons.

3. Provide a driven ground rod at each manhole or handhole, and ground all metallic parts.

4. Where installed in streets, provide traffic-rated cast iron cover and adjustable grade ring. Welded steel covers may be provided elsewhere.

5. Place boxes on 12-inche minimum of 3/4-inch minus crushed rock.

6. Place manholes on 12-inch minimum of 3/4-inch minus crushed rock.

7. Seal unused openings with cement mortar.

D. Cast-In-Place Concrete Structures:

1. Contractor shall ensure the location of each vault before construction of structure is started.

2. Construct the top, walls, and bottom of reinforced concrete. Construct the walls and bottom of monolithic concrete construction.

3. Place concrete for vaults on well-compacted soil with a minimum of 6 inches of aggregate base.

4. Provide gray cast iron frames and covers. Provide a machine-finished cover seat to ensure a matching joint between the frame and cover.

5. Where duct lines enter vaults, the sections of duct may be either cast in the concrete or may enter through a square or rectangular opening of suitable dimensions provided in the utility structure. Seal any openings used for conduit entry into vaults using a manufactured thru-wall sealing fitting or other similar approved method.

6. Provide a cable-pulling iron anchorage in the wall opposite each duct bank entrance.

7. Install vault covers flush with sidewalks or curbs.

E. Conduit and Duct Type Requirements:

1. Above grade exterior or potentially-wet areas: GRS or fiberglass conduit. Use GRS or XW fiberglass when above grade or in underground enclosed structures. Standard wall fiberglass is permitted for use in above ground areas that are concealed, not used for air handling, and where protected from damage.

2. Below grade spaces not fully enclosed (including tunnel passenger stations): PVC/GRS or low smoke zero halogen (LSZH) fiberglass conduit and accessories.

3. Conduits for emergency loads (such as emergency lighting and fire alarm system): GRS, XW fiberglass, or PVC/GRS, as required. In exposed tunnel locations, provide low smoke zero halogen (LSZH) phenolic fiberglass conduit to meet NFPA 130 requirements.

4. Below grade exterior areas: PVC/GRS conduit where direct buried or transitions to above grade, PVC and standard wall fiberglass electrical conduit encased in concrete duct banks, XW fiberglass conduit (see underground ducts and raceways for electrical systems, as stated elsewhere in the Contract Documents).

5. PVC electrical conduit may only be installed where covered with at least 3-inches of concrete, or where required in short sections for electrical isolation. Do not leave PVC conduit exposed unless specifically shown on Contract Drawings. Terminate PVC within concrete walls or slabs with a male adapter and PVC/GRS coupling installed flush with the finished surface.

6. Provide PVC/GRS conduit section for transition between an embedded conduit and the above-ground metallic conduit. Ensure that the above-ground PVC coated metallic conduit extends 1-foot minimum above ground or to box termination, whichever is less.

7. Install liquidtight flexible metal conduit only where required for flexibility such as connections to vibrating equipment and across joints subject to differential movement where the use of expansion-deflection fittings would not be suitable except where otherwise indicated on the Contract Drawing. Length shall not exceed 6 feet unless shown otherwise.

8. Flexible electrical nonmetallic tubing (ENT) is permitted for garage installations only when embedded in the concrete parking deck. Transition to GRS conduit where ENT conduit exits the slab. Exposed ENT shall not be permitted.

9. Running threads shall not be used.

F. Conduit Minimum Sizes:

1. Unless otherwise noted on drawings, minimum conduit sizes are as follows:

a. GRS: 3/4-inch diameter for exposed locations and 1-inch diameter for embedded locations.

b. PVC/GRS: 3/4-inch diameter for exposed locations and 1-inch diameter for embedded or underground locations

G. Raceways and Boxes:

1. PVC Conduit: 1-inch diameter for embedded or underground locations.

2. EB Duct: (where applicable): 4-inch diameter.

3. Epoxy or Phenolic Fiberglass Conduit: 3/4-inch diameter for exposed locations and 1-inch diameter for embedded locations.

4. Liquidtight Flexible Metallic Conduit: 1/2-inch diameter.

5. ENT: 1-inch diameter.

6. Conduit and Duct Bends:

a. Install conduit runs with not more than 270 degrees total bends between pull boxes. Where more bends are required in a run, install pull boxes as required to facilitate pulling conductors even if not indicated.

b. Minimum Bend Radius:

1) Exposed or Embedded in Platform or Structure Slabs or Walls: NFPA 70 National Electrical Code Chapter 9, Table 2 – "Other Bends".

7. Underground – Not in Station Areas:

a. 1-inch conduit: 18-inch radius.

b. 1-1/4-inch conduit: 20-inch radius.

c. 1-1/2-inch conduit: 22-inch radius.

d. 2-inch conduit: 24-inch radius.

e. 2-1/2-inch conduit: 27-inch radius.

f. 3-inch conduit: 30-inch radius.

g. 3-1/2-inch conduit: 33-inch radius.

h. 4-inch conduit: 36-inch radius.

i. 5-inch conduit: 42-inch radius.

j. 6-inch conduit: 48-inch radius.

8. Fiberglass and PVC Conduit Bending Restrictions:

a. Hot bend bends with radii less than 100 feet using a heater recommended by the conduit manufacturer. Bends with radius 100 feet or larger may be cold bent.

9. Horizontal bends in Schedule 40 PVC conduit shall have a bend radius not less than six feet, if conduit segment length (between pull points) is greater than 300 feet.

H. Conduit and Duct installation:

1. Install conduit in accordance with NFPA 70 (garages), NFPA 130 (stations and tunnels), local codes and ordinances and as indicated.

2. Prevent material and water from entering the conduit, or pull and junction boxes.

3. Provide threaded cap or similar closure designed for the purpose on conduits that are not terminated immediately. Tape is not acceptable for temporary sealing.

4. Match extensions to existing work to existing size.

5. Where conduit passes across an expansion or contraction joint in the structure, install the conduit at right angles to the joint, and an approved conduit expansion coupling or expansion/deflection fitting at the joint selected based on the expected movement of joint. Confirm with Resident Engineer.

6. Provide expansion fittings and slip collars at support points in conduit runs where required to compensate for thermal expansion.

7. Where conduit is exposed to different temperatures, seal the conduit to prevent condensation and passage of air from one area to the other.

8. If PVC conduit is not fully encased at one time, leave one end of the raceway free until encasing is restarted, or a PVC expansion joint is installed in the run.

9. When field threading of conduit is required, clean threads with a solvent to remove oil as recommended by coating manufacturer, and coat threads with organic cold galvanizing coating, in accordance with manufacturer's instructions.

10. Coat threads with oxide inhibiting compound for metal-to-metal threaded joints. Take care that compound is not present on interior of conduit after installation.

11. Seal conduits with watertight duct sealing system, where waterproofing is required.

12. Install liquidtight flexible metal conduit so that liquids tend to run off the surface and do not drain toward fittings. Provide sufficient slack to reduce the effects of vibration.

13. Terminate stubbed conduits for future use by inserting a male pipe plug with provisions for pulling cord attachment. Install wrench-tight into the flush coupling.

14. Mandrelling: As each section of a duct line is completed between pull boxes, use testing mandrel not more than 1/4 inch less than the size of the conduit and brush to clear ducting:

    a. Draw mandrel through each conduit, after which draw through a brush with stiff bristles having a diameter of 1/2–inch greater than the internal diameter of the duct, until the conduit is clear of particles of earth, sand, or gravel.

    b. Install conduit caps or plugs immediately thereafter.

    c. Notify the Resident Engineer prior to mandrelling any conduit.

d. Submit a written report providing a conduit identification number, size, material, location, the type and size of mandrel used, and indicate whether the conduit is tagged. Indicate on the report the acceptance date and initials of the Resident Engineer and the Contractor's foreman.

15. Install 1/8-inch or larger diameter polypropylene pulling cord in ducts. Ensure accessibility for conduits with threaded caps, by tying cord to internal eye of conduit caps or by fastening each cord to pull anchorage in pull box, manhole, or vault with 2 feet minimum slack.

I. Conduit Grounding and Bonding:

1. Install metallic conduits to be electrically and mechanically continuous and connected to ground by bonding to the grounding system.

2. In dry areas, provide two (2) locknuts, one inside and one outside of box or enclosure and an insulated throat grounding bushing, for rigid conduit terminating at steel box, panelboard, cabinet, or similar enclosure.

3. Conduit terminations in exposed areas and damp and wet locations:

a. Cabinet connections: provide watertight threaded hubs with sealing O-rings. Provide a positive ground connection for an external grounding conductor.

b. Cast boxes and fittings: provide threaded connections to tapered threaded hubs.

4. Terminate the conduit in appropriate boxes at motors, switches, outlets, and junction points. Provide insulating bushing or grounding bushing on conduit end.

5. See grounding and bonding for electrical systems, as stated elsewhere in the Contract Documents, for further requirements.

J. Innerduct Installation:

1. Use glue and primer as recommended by manufacturer to withstand required 125 psi pressure. Apply glue and primer under dry conditions only.

2. Install innerduct in accordance with manufacturer's recommendations to withstand required 125 psi pressure.

3. Pressure test innerduct at 125 psi after installation and verify that it withstands and maintains the pressure and has no leaks. Submit test results to Resident Engineer for approval.

4. Provide expansion fittings in innerduct runs where necessary or suggested by manufacturer to compensate for thermal expansion.

K. Raceway Support:

1. Conduit supports shall be capable of supporting a load equal to the sum of the weights of the conduits and wires, the weight of the hanger itself, plus 200 pounds. Straps and clamps shall be listed for the task and made up tight to prohibit movement unless longitudinal movement is required due to conduit expansion.

2. Where recommended by manufacturer to accommodate longitudinal movement due to thermal expansion, provide slip collars over conduits at support points.

3. Multiple runs of exposed conduit shall be grouped and supported on conduit racks constructed from channels, conduit clamps and fittings. Conduit racks shall be the trapeze style constructed from 1-5/8-inch by 1-5/8-inch steel channels, supported by 3/8-inch or ½-inch rods and concrete expansion anchors. Conduit racks shall be provided with 25 percent spare capacity, minimum.

4. Conduit racks may be used for support of vertical or horizontal conduit runs, except where otherwise specified. Conduit racks shall be braced in accordance with these Specifications to prevent sway in the event of a seismic event. Provide supplementary bolted stop-blocks below each conduit clamp in a vertical strut to assure that clamps cannot slide down the channel.

5. Where conduits 2 inch or larger nominal size are supported by racks, heavy-duty channel, clamps and accessories shall be used.

6. Support individual wall mounted horizontal conduits not larger than 1-1/2 inches in diameter by means of one hole conduit straps with back spacers or individual conduit hangers.

7. Do not fasten supports to pipes, ducts, mechanical equipment, or conduit.

8. Space conduits installed against concrete surfaces 1/4 inch away from the surface by clamp backs or other approved means.

9. Support individual horizontal conduits larger than 1 1/2 inches nominal size by individual hangers.

10. Apply a thick coat of cold galvanizing coating to the field-cut ends of steel hanger rods and steel channel by brush. Coating may be done by spraying if at least 3 coats are applied per manufacturer’s instructions.

L. Outlet, Junction, and Pull Boxes:

1. Securely attach outlet, junction, and pull boxes to the structure. Do not use conduits entering the box as supports for the box.

2. Mount outlet, junction, and pull boxes so as to prevent moisture from entering or accumulating within the boxes.

3. Junction and Pull Boxes:

a. Install so that covers are readily accessible after completion of the installation.

b. Do not install boxes above suspended ceilings, except where the ceiling is of the removable type or where definite provisions are made for access to each box.

M. Cable Trays and Supports:

1. Install cable trays as indicated using approved fittings and adequately supporting the complete system.

2. Use steel channels, threaded rods and hardware in accordance with raceways and boxes for electrical systems requirements.

3. Provide anti-sway brackets on horizontal tray assemblies in accordance with approved Seismic Bracing and Anchorage Plan (see common work results for electrical requirements as stated elsewhere in the Contract Documents).

4. Connect each isolated cable tray system or the entire tray system to the building equipment grounding system with a bare copper conductor routed throughout the tray system and bonded to each individual ladder section in accordance with all National Electrical Code requirements.

5. Provide expansion/deflection fittings in cable tray installations where they cross structure expansion joints and to accommodate differential expansion between cable tray and structure. Bond metallic cable trays across expansion/deflection fittings.

6. Provide stainless steel channel supports for all NEMA 4X stainless steel (grade 316) enclosures and boxes.

N. Installation of Concrete Expansion Anchors:

1. Concrete expansion anchors shall be used wherever a bolted attachment to solid concrete is required. Holes for anchors shall be drilled perpendicular to the concrete surface and the anchor installed in accordance with manufacturer's instructions.

2. Anchors installed at an angle to the surface, or anchors not fully seated, shall be replaced. Anchors shall not be spaced closer than 6 times the diameter of the hole, center to center.

O. Installation of Fasteners and Hardware:

1. The material, coating and finish of fasteners and hardware shall be suitable for the environment and use intended. Wherever fasteners exhibit corrosion at any time during the Contract, the fasteners or hardware shall be replaced with a suitable type as directed by Resident Engineer at no additional cost to Sound Transit.

P. Field Touch Up:

1. Perform on galvanized surfaces where required due to cutting or construction damage.

2. Brush coat with a zinc rich paint, after cleaning with a solvent to remove oil. Coating may be done by spraying if at least three coats are applied.

3. For finished surfaces in public areas, apply overall coat of compatible paint with color and surface texture matching adjacent surfaces.

3.04 INTERFACE WITH OTHER WORK

A. Coordinate the work of this Section with the other electrical sections as stated elsewhere in the Contract Documents, as required to provide a complete and operable electrical installation.

B. Coordinate electrical services and work with the serving utility company and the Resident Engineer, as applicable.

C. Coordinate with work completed or in progress or to be performed under other sections of these Specifications or by other contractors. Make indicated connections to previously completed work. Where future connections to or extensions of the work are indicated, provide safe and convenient provisions for such future connections and extensions.

D. Contract Drawings show electrical equipment, raceways, and other electrical facilities diagrammatically and do not show all accessories or fittings that may be required because of obstructing structural features and architectural finishes, interfering utilities, ducts, and mechanical equipment. Investigate such conditions and determine the need for locating equipment and materials and routing electrical raceways clear of such obstructions and interferences. Provide complete and operable electrical systems and installations in conformance with these Specifications.

E. Coordinate with work completed or in progress or to be performed under other sections of these Specifications or by other contractors or by designated subsequent contracts in the same space. Make indicated connections to previously completed work. Where future connections to or extensions of the work are indicated, provide safe and convenient provisions for such future connections and extensions.

END OF SECTION

SECTION 26 05 53

IDENTIFICATION FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for providing nameplates, wire and cable markers, conduit tags, conduit color coding, identification for raceway and metal clad cable, underground warning tape, warning labels and signs, and equipment identification labels.

1.02 SUBMITTALS

A. Submit:

1. Manufacturer's product data for nameplate mounting hardware.
2. Schedule for nameplates including list of wording, symbols, letter size, color coding, tag number, location, and function.
3. Samples: For each type of label and sign to illustrate size, color, lettering style, mounting provisions and graphic features.

PART 2 - PRODUCTS

2.01 MATERIALS

A. Nameplates:

1. Engraved three-layer melamine laminated plastic, not less than 3/32 inch thick.
2. Color: Black letters on a white background unless otherwise noted.
3. Emergency equipment cabinets: Nameplates shall have white letters on an orange background in accordance with NFPA 70 code requirements.

B. Wire and Cable Markers:

1. Sleeves: Non-fading, waterproof, heat-shrink plastic, machine-printed sleeve labels.
2. Cable Tags: Non-fading, plastic, printed cable tag with holes for attachment to cable with nylon cable ties.

C. Conduit Tags:

1. Size: As noted for each application in this specification.
2. Type: Designed for permanent identification. Comply with ANSI A13.1 for minimum size of letters and minimum length of color field for each raceway and cable.

D. Mounting Screws: Stainless steel machine screws or rivets

E. Mounting Adhesive: Permanent

PART 3 - EXECUTION

3.01 INSTALLATION

A. Nameplates and Identification Labels:

1. Degrease and clean surfaces to receive nameplates and identification labels.

2. Install nameplates parallel to equipment and conduit lines.

3. Secure nameplates to equipment fronts using screws or rivets. Secure nameplate to inside face of recessed panelboard or cabinet doors in finished locations.

B. Cable Tags: Affix securely to cables and conductor bundles using compatible nylon cable ties.

C. Conduit Tags: Comply with manufacturer's recommended installation procedures for a permanent installation.

D. Wire and Cable Markers.

1. Heat-shrink wire and cable markers after final installation and testing.

3.02 CONSTRUCTION

A. Identification Schedule:

1. Conductors:

a. Provide sleeve wire markers printed and installed in accordance with manufacturer's recommendations to identify each single and multiple-conductor wire and cable in panelboards, gutters, pull boxes, manholes, and at load connections.

b. In gutters, pull boxes, and manholes, if cables are not spliced, a cable tag shall be used. Attach tag securely to cable with nylon cable tie at location accessible and visible by personnel.

c. Identify cable destination and number of conductors in cable as described in Contract Drawings.

1) Power and Lighting Circuits: Identify with branch circuit or feeder number.

2) Control Wiring: Identify with control wire number as indicated on the Contract Drawings or fabricator's shop drawings.

2. Conduit and MC Cable Identification:

a. Where accessible in canopy columns and light poles, provide tag identifying system type and identifier listed on conduit and conductor schedule. Attach tag securely with nylon cable tie.

b. Provide tags on conduits at conduit termination and access points.

c. For conduits with assigned raceway numbers, provide conduit tag matching conduit identification on Contract Documents. For multiple, parallel raceways with one raceway identifier, assign supplementary letter designations for each raceway group.

d. For conduits without assigned raceway numbers, provide generic conduit tag describing system (communications, signals, power lighting, etc.) plus identification of associated termination points.

e. Font Size:

1) 3/4-inch tags: Minimum 36-point.

2) 1-inch tags: Minimum 48-point.

3) If exposed conduit length is not sufficient to accommodate these font sizes, reduce font to the maximum size possible, rotate tag at 90-degrees, or apply tag to equipment or box nearest conduit termination.

3. Provide nameplates of minimum letter height as scheduled below unless otherwise noted:

a. Each disconnecting means shall be marked with an identification plate in letters at least ½-inch high.

b. Switchgear, Panelboards, Switchboards, and Lighting Controllers: 3/8 inch, identify equipment designation; ¼-inch, identify voltage rating and source.

c. Disconnect Switches: 3/8-inch, identify equipment designation; ¼-inch, identify voltage rating, source, and load served.

d. Individual Circuit Breakers in Panelboards: ¼-inch; identify circuit with load served. For lighting, include the specific zone in the description if applicable on the schedule.

e. Motor Starters: ¼-inch; identify circuit.

f. Individual Circuit Breakers, Enclosed Switches, and Motor Starters: ¼-inch; identify load served.

g. Transformers: 3/8-inch; identify equipment designation. ¼-inch; identify primary and secondary voltages, primary source, and secondary load and location.

h. Devices: ¼-inch; identify device:

1) Dimmers

2) Control devices

3) Pushbutton stations

4. Emergency Systems: For all boxes and enclosures larger than 6 inches by 6 inches (including transfer switches, central lighting inverters, and power panels) for emergency circuits, provide a permanent identification plate that is orange in color with white lettering. All other device and junction boxes for emergency systems and circuits shall be orange in color, both inside and outside.

5. Smoke Control Systems: For all boxes and enclosure larger than 6 inches by 6 inches (including transfer switches, central lighting inverters, and power panels)

for smoke control power and control circuits, provide a permanent identification plate that is orange in color with a yellow diagonal stripe. All other device and junction boxes for smoke control systems and circuits shall be orange in color, both inside and outside. Cover plates shall be orange in color with a yellow diagonal stripe.

6. Stair pressurization systems: For all boxes and enclosure larger than 6 inches by 6 inches (including transfer switches, central lighting inverters, and power panels) for stair pressurization power and control circuits, provide a permanent identification plate that is orange in color with a gray diagonal stripe. All other device and junction boxes for stair pressurization systems and circuits shall be orange in color, both inside and outside. Cover plates shall be orange in color with a gray diagonal stripe.

7. Non-Emergency Systems: For all boxes and enclosures larger than 6 inches by 6 inches for non-emergency circuits, provide a permanent identification plate that is black in color with white lettering.

8. Fire Alarm Systems: For all boxes and enclosures larger than 6 inches by 6 inches for fire alarm circuits, provide a permanent identification plate that is red in color with white lettering. All other devices and junction boxes for fire alarm systems and circuits shall be red in color, both inside and outside.

9. Concrete Paver Covering Electrical Handhole: Install ferrule inserts in four corners of pavers to identify location of handhole beneath paver where indicated on Drawings.

B. Conduit Color Coding:

1. Low-voltage and Medium voltage Distribution Systems: Unpainted or black

2. Fire Alarm System: Junction boxes / conduit bodies shall be substantially red in color both inside and out. Conduit and couplings shall be substantially red in color.

3. Color-Coding for Phase and Voltage Level Identification, 600 V and Less: Use the colors listed below for ungrounded service, feeder, and branch-circuit conductors:

a. Color shall be factory applied or, for sizes LARGER than No. 10 AWG if authorities having jurisdiction permit, field applied.

b. Colors for 208/120-V Circuits:

1) Phase A: Black.

2) Phase B: Red.

3) Phase C: Blue.

c. Colors for 480/277-V Circuits:

1) Phase A: Brown.

2) Phase B: Orange.

3) Phase C: Yellow.

d. Field-Applied, Color-Coding Conductor Tape: Apply in half-lapped turns for a minimum distance of 6 inches from terminal points and in boxes where splices or taps are made. Apply last two turns of tape with no tension to prevent possible unwinding. Locate bands to avoid obscuring factory cable markings.

END OF SECTION

SECTION 26 05 74

OVERCURRENT PROTECTIVE DEVICE, SHORT CIRCUIT AND ARC FLASH STUDIES

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for contractor to provide a computer-based time-current coordination, short circuit and arc-flash study to determine settings for overcurrent protective devices, verify that equipment and protective devices are applied within their ratings, and determine the arc-flash hazard distance and the incident energy to which personnel could be exposed during work on or near electrical equipment. The study shall include the entire electrical system (both existing and proposed) for the facility.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents.

1. Insulated Cable Engineers Association (ICEA):

   a. ICEA P-32-382 Short Circuit Characteristics of Insulated Cables.

   b. ICEA P-45-482 Short Circuit Performance of Metallic Shields and Sheaths on Insulated Cable.

2. Institute of Electrical and Electronics Engineers (IEEE):

   a. IEEE 141 Recommended Practice for Electric Power Distribution for Industrial Plants.

   b. IEEE 242 Protection and Coordination of Industrial and Commercial Power Systems.

   c. IEEE 399 Recommended Practice for Industrial and Commercial Power Systems Analysis.

   d. IEEE 551 Recommended Practice for Calculating Short-Circuit Currents in Industrial and Commercial Power Systems.

   e. IEEE 1584 Guide for Performing Arc-Flash Hazard Calculations.

   f. IEEE C57.12.00 General Requirements for Liquid-Immersed Distribution, Power, and Regulating Transformers.

   g. IEEE C57.96 Guide for Loading Dry-Tape Distribution and Power Transformers.

3. National Fire Protection Association:

   a. NFPA 70E Standard for Electrical Safety in the Workplace.

B. Definitions:

1. One-Line Diagram: A diagram which shows, by means of single lines and graphic symbols, the course of an electric circuit or system of circuits and the component devices or parts used therein.

2. Protective Device: A device that senses when an abnormal current flow exists and then removes the affected portion from the system.

3. SCCR: Short-circuit current rating.

4. Service: The conductors and equipment for delivering electric energy from the serving utility to the wiring system of the premises served.

1.03 SUBMITTALS

A. Transmit the following:

1. Product Data: For computer software program to be used for studies.

2. Product Certificates: For arc-flash hazard analysis software, certifying compliance with IEEE 1584 and NFPA 70E.

3. Study input data, including completed computer program input data sheets. Provide after the approval of system protective devices submittals.

4. Qualification Data: Professional Engineer

B. Submit the following:

1. Study report; signed, dated, and sealed by a qualified professional engineer.

a. Study shall include short circuit, selective coordination, and arc flash calculations.

b. Study shall include arc flash labels for all system busses that could be worked on in an energized state.

c. Provide study report for action prior to receiving final approval of the distribution equipment submittals. If formal completion of studies will cause delay in equipment manufacturing, obtain approval from Sound Transit for preliminary submittal of sufficient study data to ensure that the selection of devices and associated characteristics is satisfactory.

d. Study report at end of project to document as-built condition. Provide signed and sealed report, electronic copy, and all electronic source files from the power system modeling software.

2. Maintenance procedures according to requirements in NFPA 70E shall be provided in the equipment manuals.

3. Operation and Maintenance Procedures: Provide maintenance procedures for use by Sound Transit's personnel that comply with requirements in NFPA 70E.

1.04 QUALITY ASSURANCE

A. Studies shall use computer programs that are distributed nationally and are in wide use. Software algorithms shall comply with requirements of standards and guides specified in this Section. Manual calculations are unacceptable.

B. Arc-Flash Study Specialist Qualifications: Professional engineer in charge of performing the study, analyzing the arc flash, and documenting recommendations, licensed in the state where Project is located. All elements of the study shall be performed under the direct supervision and control of this professional engineer.

PART 2 - PRODUCTS

2.01 COMPUTER SOFTWARE DEVELOPERS

A. Software Developers: Subject to compliance with requirements, perform analysis using the latest version of one of the following:

1. Operation Technology, Inc. (ETAP).

2. SKM Systems Analysis, Inc. (Power Tools for Windows).

B. Comply with IEEE 1584 and NFPA 70E.

C. Analytical features of device coordination study computer software program shall have the capability to calculate "mandatory," "very desirable," and "desirable" features as listed in IEEE 399.

2.02 STUDY REPORT CONTENT

A. Executive summary.

B. Study descriptions, purpose, basis and scope.

C. One-line diagram, showing the following:

1. Protective device designations, ampere ratings and amp trip setting.

2. Cable size and lengths.

3. Transformer kilovolt ampere (kVA) and voltage ratings.

4. Motor and generator designations and kVA ratings.

5. Switchgear, switchboard, motor-control center, panelboard, and enclosed breaker and switch designations.

6. Utility source(s)

D. Study Input Data: As described in "Power System Data" Article.

E. Short-Circuit calculations: The calculation results shall include the following information:

1. Interrupting Duty Report: Three-phase and unbalanced fault calculations, showing the following for each system bus and equipment location:

a. Voltage.

b. Calculated symmetrical fault-current magnitude and angle.

c. Fault-point X/R ratio.

d. No AC Decrement (NACD) ratio.

e. Equivalent impedance.

f. Multiplying factors for 2-, 3-, 5-, and 8-cycle circuit breakers rated on a symmetrical basis.

g. Multiplying factors for 2-, 3-, 5-, and 8-cycle circuit breakers rated on a total basis.

F. Protective device coordination study: The study results shall include the following information:

1. Protective device trip curves for relays, electronic trip breakers, thermal magnetic breakers, fuses, overloads, etc.

2. Trip settings for selectable trip devices.

3. Trip settings for ground fault trip devices.

4. Relay setpoint files for any electronic relays.

5. Motor starting curves.

6. Transformer inrush points.

7. Generator damage curves.

8. Time current coordination curves demonstrating selective coordination of all fault paths in the system.

G. Arc-Flash Calculation: Calculation results shall include fault study input data, fault scenario descriptions, and fault-current calculations. The calculation results shall include definitions of terms and guidance for interpretation of computer printouts. The results shall include the following information for all buses and equipment in the system:

1. Arcing fault magnitude.

2. Protective device clearing time.

3. Duration of arc.

4. Arc-flash boundary.

5. Working distance.

6. Incident energy.

7. Recommended personal protective equipment.

8. Recommendations for arc-flash energy reduction.

2.03 ARC-FLASH WARNING LABELS

A. Comply with requirements in identification for electrical systems as required by the Contract. Produce a 3.5-by-5-inch thermal transfer label of high-adhesion polyester for each work location included in the analysis.

B. The label shall be in accordance with NFPA 70E. Label shall have an orange header with the wording, "WARNING, ARC-FLASH HAZARD," and shall include the following information taken directly from the arc-flash hazard analysis:

1. Location designation
2. Nominal voltage
3. Flash protection boundary
4. Incident energy
5. Working distance
6. Engineering report number, revision number, and issue date

C. Labels shall be machine printed, with no field-applied markings.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine Project overcurrent protective devices based on initial product transmittals, and for the as-built condition. Proceed with study only after relevant equipment submittals have been assembled. Overcurrent protective devices that have not been submitted and approved prior to study may not be used in study.

3.02 SHORT-CIRCUIT ANALYSIS

A. Perform study following the general study procedures contained in IEEE 399.

B. Calculate short-circuit currents according to IEEE 551.

C. All devices and equipment in the electrical distribution system shall be included in the study.

D. Analyze the electrical distribution system from normal and alternate power sources throughout electrical distribution system for the Project. Include studies of system switching configurations and alternate operations that could result in maximum fault conditions.

E. The calculations shall include the ac fault-current decay from induction motors, synchronous motors, and asynchronous generators and shall apply to low- and medium voltage ac systems.

F. Calculate short-circuit momentary and interrupting duties for three-phase bolted faults and single line-to-ground faults at all busses and equipment in the distribution system and note selected equipment deficiencies for the following:

1. Electric utility's supply termination point.
2. Substation primary and secondary terminals.

3. Switchgear and switchboards.

4. Motor-control centers and standalone combination motor starters.

5. Automatic and manual transfer switches.

6. Panelboards and control panels.

7. Disconnect switches and enclosed circuit breakers.

8. Transformer primary and secondary.

3.03 PROTECTIVE DEVICE COORDINATION STUDY

A. Perform coordination study using approved computer software program. Prepare a written report using results of fault-current study. Comply with IEEE 399:

1. Calculate the maximum and minimum 1/2-cycle short-circuit currents.

2. Calculate the maximum and minimum interrupting duty (5 cycles to 2 seconds) short-circuit currents.

3. Calculate the maximum and minimum ground-fault currents.

B. Comply with IEEE 141 and IEEE 242 recommendations for fault currents and time intervals. (Comply with NEC for selective coordination NFPA 70; 240.12, 620.62, 700.27, 701.18).

C. Transformer Primary Overcurrent Protective Devices:

1. Device shall not operate in response to the following:

a. Inrush current when first energized.

b. Self-cooled, full-load current or forced-air-cooled, full-load current, whichever is specified for that transformer.

c. Permissible transformer overloads according to IEEE C57.96 if required by unusual loading or emergency conditions.

2. Device settings shall protect transformers according to IEEE C57.12.00 for fault currents.

D. Conductor Protection: Protect cables against damage from fault currents according to ICEA P-32-382, ICEA P-45-482, and conductor melting curves in IEEE 242. Demonstrate that equipment withstands the maximum short-circuit current for a time equivalent to the tripping or clearing time of over current protective devices including relays, circuit breakers and fuses. To determine temperatures that damage insulation, use curves from cable manufacturers or from listed standards indicating conductor size and short-circuit current.

E. Coordination-Study Report: Prepare and submit a written report including the following information:

1. Table of trip characteristics of fixed trip over current protective devices including thermal magnetic breakers and fuses.

2. Table of trip settings for selectable trip Overcurrent Protective Devices including the following information:

a. Device tag.

b. Relay-current transformer ratios; and tap, time-dial, and instantaneous pickup values.

c. Circuit-breaker sensor rating; and long-time, short-time, and instantaneous settings.

d. Ground-fault relay-pickup and time-delay settings.

3. Trip curves for all overcurrent protective devices in the system.

4. Trip curves for utility protective devices.

5. Coordination Curves: Time Current Curves (TCC) shall demonstrate selective coordination for all fault paths in the distribution system. TCC's shall graphically illustrate that adequate time separation exists between devices installed in series, including power utility company's upstream devices. Prepare separate sets of curves for the switching schemes and for emergency periods where the power source is local generation. Provide TCC for all fault paths in the system and terminate device characteristic curves at a point reflecting the maximum symmetrical or asymmetrical fault current to which the device is exposed.

6. Show the following information:

a. Device tag.

b. Voltage and current ratio for curves.

c. Three-phase and single-phase damage points for each transformer.

d. No damage, melting, and clearing curves for fuses.

e. Cable damage curves.

f. Transformer inrush points.

g. Motor starting curves.

h. Generator damage curves.

i. Maximum fault-current cutoff point.

F. Provide completed data sheets for setting of overcurrent protective devices bound in a 3-ring binder.

G. Provide electronic settings data file for all relays.

3.04 ARC-FLASH HAZARD ANALYSIS

A. Comply with NFPA 70E and its Annex D for hazard analysis study.

B. Use the short-circuit and coordination analysis results as input data.

C. Calculate maximum and minimum fault-current scenarios:

1. The minimum fault current scenario shall assume that the fault contribution from all sources is at a minimum and motor are not running.

2. The maximum calculation shall assume a maximum fault contribution from all sources and shall assume all motors are operating at full-load.

D. Calculate the arc-flash protection boundary and incident energy at all buses and locations in the electrical distribution system where personnel could perform work on energized parts.

E. Include medium- and low-voltage equipment locations. Safe working distances shall be specified for calculated fault locations based on the calculated arc-flash boundary, considering incident energy of 1.2 cal/sq.cm.

F. Incident energy calculations shall consider the accumulation of energy over time when performing arc-flash calculations on buses with multiple sources. Iterative calculations shall take into account the changing current contributions, as the sources are interrupted or decremented with time. Fault contribution from motors and generators shall be decremented as follows:

1. Fault contribution from induction motors should not be considered beyond three to five cycles.

2. Fault contribution from synchronous motors and generators should be decayed to match the actual decrement of each as closely as possible (e.g., contributions from permanent magnet generators will typically decay from 10 per unit to three per unit after 10 cycles).

G. Arc-flash computation shall include both line and load side of a circuit breaker as follows:

1. When the circuit breaker is in a separate enclosure.

2. When the line terminals of the circuit breaker are separate from the work location.

H. Base arc-flash calculations on actual overcurrent protective device clearing time. Cap maximum clearing time at two seconds based on IEEE 1584, Section B.1.2.

I. Indicate recommended personal protective equipment at all busses and equipment in the system.

3.05 POWER SYSTEM DATA

A. Obtain all data necessary for the conduct of the arc-flash hazard analysis:

1. Verify completeness of data supplied on the one-line diagram on Drawings. Call discrepancies to the attention of Engineer of Record.

2. For new equipment, use characteristics submitted under the provisions of action submittals and information submittals for this Project.

3. For existing equipment, whether or not relocated, obtain required electrical distribution system data by field investigation and surveys, conducted by qualified technicians and engineers.

B. Gather and tabulate the following input data to support coordination study. Comply with recommendations in IEEE 1584 and NFPA 70E as to the amount of detail that is required to be acquired in the field. Field data gathering shall be under the direct supervision and control of the engineer in charge of performing the study.

1. Product Data for overcurrent protective devices specified in other Sections and involved in overcurrent protective device coordination studies. Use equipment designation tags that are consistent with electrical distribution system diagrams,

overcurrent protective device submittals, input and output data, and recommended device settings.

2. Obtain electrical power utility impedance at the service.

3. Power sources and ties.

4. For transformers, include kVA, primary and secondary voltages, connection type, impedance, X/R ratio, taps measured in per cent, and phase shift.

5. For reactors, provide manufacturer and model designation, voltage rating and impedance.

6. For circuit breakers and fuses, provide manufacturer and model designation. List type of breaker, type of trip and available range of settings, SCCR, current rating, and breaker settings.

7. Generator short-circuit current contribution data, including short-circuit reactance, rated kVA, rated voltage, and X/R ratio.

8. For relays, provide manufacturer and model designation, current transformer ratios, potential transformer ratios, and relay settings.

9. Busway manufacturer and model designation, current rating, impedance, lengths, and conductor material.

10. Motor horsepower and NEMA MG 1 code letter designation.

11. Low-voltage cable sizes, lengths, number, conductor material and conduit material (magnetic or nonmagnetic).

12. Medium-voltage cable sizes, lengths, conductor material, and cable construction and metallic shield performance parameters.

3.06 LABELING

A. Apply arc-flash labels for all applicable electrical equipment including the following:

1. Utility service equipment.

2. Panelboards.

3. Disconnects.

4. Enclosed circuit breakers.

5. Automatic and manual transfer switches.

6. Motor-control centers.

7. Combination motor starters.

8. Low-voltage switchboards.

9. Switchgear.

10. Medium-voltage switches.

11. Control panels.

12. Transformer primary and secondary.

13. Load equipment such as HVAC equipment and any other equipment requiring servicing, adjustment or inspection while energized.

3.07 APPLICATION OF WARNING LABELS

A. After Sound Transit approval of the arc flash study, install the arc-fault warning labels under the direct supervision and control of the Arc Flash Study Specialist.

3.08 DEMONSTRATION

A. Engage the Arc-Flash Study Specialist to train Sound Transit's maintenance personnel in the potential arc-flash hazards associated with working on energized equipment and the significance of the arc-flash warning labels.

END OF SECTION

SECTION 26 08 00

COMMISSIONING OF ELECTRICAL SYSTEMS

NOTE TO DESIGNER:

SECTIONS WITH BRACKETS. E.G., [TEXT] ARE TO BE MODIFIED OR DELETED IF NOT APPLICABLE. ITALICIZED TEXT PROVIDES INSTRUCTION TO THE DESIGNER TO INCLUDE LANGUAGE ON SPECIFIC TOPICS WHEN APPLICABLE. THE INSTRUCTIONS ARE TO BE DELETED WHEN THE SPECIFICATION IS FINALIZED. LANGUAGE NOT IN BRACKETS IS TO BE USED 'AS IS' WITHOUT MODIFICATION OR WITH AN APPROVED SPECIFICATION MODIFICATION REQUEST.

DESIGNER TO DELETE TEXT ABOVE FOR FINAL SECTION

PART 1 - GENERAL

1.01 SUMMARY

A. Section excludes:

1. Requirements for train control house system electrical equipment and traction power substation commissioning as this is governed under Section 01 91 13 - General System Testing and Commissioning Requirements.

B. Section includes:

1. Requirements for commissioning process requirements for electrical systems:

a. Level 1 commissioning activities for electrical systems.

b. Level 2 commissioning activities for electrical systems.

c. Support for Level 3 commissioning activities related to electrical systems.

d. Support for Level 4 commissioning activities related to electrical systems.

e. Providing qualified personnel to assist in commissioning tests.

f. Providing equipment, materials, and labor necessary to correct issues found during the commissioning process, which fulfill contract and warranty requirements.

1.02 REFERENCES

A. This Section incorporates by reference in individual sections of Division 26 the latest revisions of the following documents and standards. Refer to individual specification sections for greater detail:

1. NACE International.

2. Institute of Electrical and Electronic Engineers (IEEE).

3. National Fire Protection Association (NFPA).

4. International Electrical Testing Association (NETA).

5. National Institute of Standards and Technology (NIST).

6. Underwriters Laboratories (UL).

7. American National Standards Institute (ANSI).

8. National Electrical Manufacturer's Association (NEMA).

9. ASHRAE Guideline 0-2005, The Commissioning Process (including Amendments)

B. Definitions:

1. Refer to Section 01 91 13 - General System Testing and Commissioning Requirements for commissioning definitions.

1.03 COORDINATION

A. Refer to Section 01 91 13 - General System Testing and Commissioning Requirements for general coordination requirements related to commissioning.

1.04 COMMISSIONING ACTIVITIES

A. Commissioning work furnishes labor and material to accomplish building commissioning as specified in the Contract Documents and in this specification, including:

1. Review General Requirements outlined in Section 01 91 13 - General System Testing and Commissioning Requirements.

2. Provide to the Sound Transit Testing and Commissioning Manager preliminary operations and maintenance information for submittal.

3. Assist the Sound Transit Testing and Commissioning Manager in developing commissioning activity procedures and data forms submittals for work specified in this Section.

4. Provide information to the Testing and Commissioning Manager needed for control interface wiring diagrams submittals for the work of this Section.

5. Perform Level 1 commissioning activities specified in this Section, including installation verification, static tests, start-up, component tests, equipment tests, systems tests.

6. Perform Level 2 commissioning activities specified in this Section, including intra-station system interface tests.

7. Provide support for Level 3 commissioning activities, including jointly with the communications system contractor field testing points in the interface terminal strips, being present during level 3 testing with sufficient labor and support personnel to adjust equipment and troubleshoot system failures that might arise. When material or equipment provided by this Division is found to be in conflict with specified criteria, adjust or replace said material or equipment, with the assistance of manufacturer as needed.

8. Provide support for Level 4 commissioning activities, including providing sufficient labor and support personnel to adjust equipment and troubleshoot system failures that might arise during pre-revenue testing.

9. Operate equipment and system during commissioning activities as required by the Testing and Commissioning Manager.

10. Perform and document commissioning tests to verify readiness for commissioning test demonstration. Commissioning tests are specified in this specification.

11. Correct issues and repeat commissioning tests when results do not meet acceptance criteria.

12. Perform commissioning test demonstration specified in this specification to verify acceptable performance.

13. Record and submit commissioning test demonstration data and issues.

14. Correct issues and repeat commissioning test demonstration when results do not meet Acceptance Criteria.

15. Attend commissioning meetings as requested by the Sound Transit Testing and Commissioning Manager.

16. Report any inconsistencies or issues in system operations or performance.

17. Provide personnel to support commissioning test demonstration specified in this specification as requested by the Sound Transit Testing and Commissioning Manager.

18. In the event that a commissioning test demonstration fails, assist in determining the cause of failure. Make corrections.

19. Cooperate with Testing and Commissioning Manager to make equipment and systems ready for commissioning tests specified in this specification as early in the construction schedule as possible.

20. Provide factory start-up services for key equipment and systems specified in Division 26. Coordinate this work with the manufacturer and the Testing and Commissioning Manager.

21. Complete all phases of work so the system can be started, tested, balanced, and otherwise commissioned. Division 26 has start-up responsibilities with obligations to complete systems, including all sub-systems so they are functional. This includes the complete installation of all equipment and materials per the contract documents and related directives, clarifications, change orders.

22. Commissioning is intended to begin upon completion of a system. Commissioning may proceed prior to the completion of systems and sub-systems, if expediting this work is in the best interests of Sound Transit. Commissioning activities and schedule will be coordinated with the Contractor. Start of commissioning before system completion will not relieve the Contractor from completing those systems.

B. Cooperate with the Sound Transit Testing and Commissioning Manager to accomplish commissioning work on schedule and in coordination with other trades.

1.05 QUALITY ASSURANCE

A. Coordinate completion of Installation Verification forms, by the Quality Control Inspector, as identified in the Contractors Quality Control Inspection and Test Plan.

1.06 LABELS

A. Upon completion of tests by a testing firm, a NETA label shall be attached to all serviced devices. These labels shall indicate date serviced and the testing company.

PART 2 - PRODUCTS

2.01 TEST EQUIPMENT

A. Provide test equipment and instrumentation, including consumable supplies, required to execute commissioning activities. Unless noted otherwise, test equipment and instrumentation remain the property of the Contractor.

B. Standard certified test equipment for commissioning shall be provided by Division 26.

2.02 PROPRIETARY TEST INSTRUMENTS

A. Provide proprietary test instruments or tools required by the equipment manufacturer. Provide and operate the proprietary test instruments or tools as required for commissioning work.

PART 3 - EXECUTION

3.01 PARTICIPATION IN COMMISSIONING

A. Provide skilled technicians to start-up and debug all systems with the division of work. These same technicians shall be made available to assist the Sound Transit Testing and Commissioning Manager in completing the commissioning program as it relates to each system and their technical specialty. Work schedules and time required for testing shall be requested and coordinated by the Sound Transit Testing and Commissioning Manager. Contractor shall ensure the qualified technician(s) are available and present during the agreed-upon schedules and of sufficient duration to complete the necessary tests, adjustments, and problem resolutions.

3.02 LEVEL 1 COMMISSIONING ACTIVITIES REQUIREMENTS

A. Level 1 commissioning activities scope: Technical requirements for commissioning of electrical systems are specified in this specification.

B. Provide technicians, instrumentation, and tools to perform commissioning activities in accordance with accepted commissioning activity procedures at the direction of the Sound Transit Testing and Commissioning Manager.

C. Scope of electrical systems commissioning activities applies to all portions of the electrical systems installation described in the test.

D. Preparation:

1. Certify that electrical systems, subsystems, and equipment have been completed, calibrated, and started; and are operating in accordance with Contract Documents.

2. Ensure that all enclosures for electrical equipment are clean and debris free.

3. Ensure that all enclosures for electrical equipment or conductors that are located in public and non-secure spaces have covers that are secured with the appropriate tamperproof, uniquely keyed fastener.

4. Ensure that all enclosures for electrical equipment or conductors have identification nameplates.

5. Testing Instrumentation: Install measuring instruments and logging devices to record test data in accordance with accepted commissioning test procedures as directed by the Testing and Commissioning Manager.

6. Certify that electrical systems instrumentation and control systems have been completed and calibrated; are operating according to the Contract Documents; and that pretest set points have been recorded.

7. Set systems, subsystems, and equipment into operating mode to be tested (e.g., normal shut down, normal auto position, normal manual position, unoccupied cycle, emergency power, and alarm conditions) in accordance with accepted commissioning test procedures as directed by the Testing and Commissioning Manager.

E. Test all operating modes, interlocks, control responses, responses to abnormal or emergency conditions, and verify proper response of building automation system controllers and sensors.

F. Tests will be performed using design conditions whenever possible.

G. Simulated conditions may need to be imposed using an artificial load when it is not practical to test under design conditions. Provide equipment to simulate loads. Set simulated conditions in accordance with accepted commissioning test procedures as directed by the Testing and Commissioning Manager. Document simulated conditions and methods of simulation. After tests, return settings to normal operating conditions.

H. Request approval to alter set points when simulating conditions is not practical.

I. Request approval to alter sensor values with a signal generator when design or simulating conditions and altering set points are not practical.

J. If tests cannot be completed because of a deficiency outside the scope of the electrical system, document the deficiency and report it to the Resident Engineer. After deficiencies are resolved, reschedule tests.

3.03 LEVEL 1 AND LEVEL 2 COMMISSIONING ACTIVITY PROCEDURES

A. Submit level 1 commissioning activity test procedures and data forms for the following types of commissioning activities, requirements for which are specified in this specification:

1. Level 1 commissioning activities:

a. Installation verification

b. Static tests

c. Start-up procedures

d. Component tests

e. Equipment tests

f. System tests

g. [*Review identified IV's, E and S tests and add or modify as necessary based on location design for envelope systems]*

B. Cooperate with the Testing and Commissioning Manager to develop level 2 commissioning activity test procedures and data forms related to the work of this Division. Provide information as needed, including interfaces with equipment and systems installed by others:

1. Level 2 commissioning activities:

   a. Intra-station system interface tests.

[Review identified IV's, E and S tests and add or modify as necessary based on location design for envelope systems]

3.04 LEVEL 1 INSTALLATION VERIFICATION REQUIREMENTS

A. Scope: Installation verification checklists are required for the following, at minimum:

1. 2608-IV-01 Power wires, conductors, and cables:

   a. Low voltage.

   b. Medium voltage.

2. 2608-IV-02 Grounding and bonding for electrical systems.

3. 2608-IV-03 Transformers:

   a. Low voltage transformers.

   b. Dry-type medium voltage transformers.

4. 2608-IV-04 Medium voltage metal clad switchgear.

5. 2608-IV-05 Switchboards.

6. 2608-IV-06 Panelboards.

7. 2608-IV-07 Circuit breakers:

   a. Molded-case Circuit Breakers (60 amps and above, 3-phase).

   b. Low Voltage Power Circuit Breakers.

   c. Medium Voltage Power Circuit Breakers.

8. 2608-IV-08 Motor control centers.

9. 2608-IV-09 Motor Control Equipment (FVNR, Soft-Start and VFD).

10. 2608-IV-10 Protective Device Relays.

11. 2608-IV-11 Instrument Transformers.

12. 2608-IV-12 Metering and Instrumentation.

13. 2608-IV-13 Central battery inverter.

14. 2608-IV-14 Batteries.

15. 2608-IV-15 Static uninterruptible power supply.

16. 2608-IV-16 Lighting systems:

    a. Exterior lighting systems:

        1) Verify the CCT (correlated color temperature).

    b. Interior lighting systems:

        1) Verify the CCT (correlated color temperature).

    c. Exit Sign.

    d. Lighting Control Panels.

    e. Control devices:

        1) Occupancy sensor.

        2) Vacancy sensor.

        3) Daylighting Controls.

        4) Photocell.

        5) Manual light switch.

17. 2608-IV-17 Photovoltaic Collectors.

18. 2608-IV-18 Electric Vehicle charging systems.

    [Designer: verify the Project Requirements for types of EV Charging Station and installation requirements.]

19. 2608-IV-23 Transfer Switches:

    a. Manual Transfer Switch.

    b. Automatic Transfer Switch.

20. 2608_IV-24 Enclosed Switches, Fuses and Disconnects.

21. 2608_IV-25 Generators:

    a. Standby Generator.

    b. Generator’s plug receptacle.

    [Designer: Review identified systems and add to list or modify as necessary based on location design for fall-arrest systems. Coordinate with 11 24 29.]

B. Installation Verification Scope: Technical requirements for Installation Verification of electrical systems are specified in this specification.

C. Installation verification checklist forms shall include the following:

1. Organized to prompt the installer to check off quality criteria for each discrete portion of the Work.

2. Identify the system or features to which the installation verification checklist applies at the top of the form.

3. Section for verification of delivery of accepted materials.

4. Section for condition of materials at delivery.

5. Section for description of installation steps. Include manufacturer's installation instructions.

6. Space at the end of the form for the installer to print their name and company name, fill in the date, and sign or initial.

7. Space at the end of the form for the Quality Control inspector designated for the scope to review and accept installation verification. QC Inspector must perform Install Verification and verify each element identified in form has been reviewed for conformance with contract documents and in accordance with the Contractors Quality Control Inspection and Test Plan as part of Section 01 45 00 - Quality Assurance/Quality Control.

8. Space to identify the area of work for which the installer is executing the Installation Verification Checklist.

9. Description of the quality criteria as it pertains to the specific work. Include a checkbox for each criterion.

D. Quality Criteria: Installation verification checklists shall address the following quality criteria:

1. Make and model match accepted submittals.

2. Equipment is installed without visible damage.

3. Location is as indicated on Contract Drawings.

4. Equipment is accessible for maintenance using safe work practices.

5. There is sufficient space to remove and replace components intact without demolishing other work.

6. Identification of components is legible and located to be visible.

E. Fill out and sign installation verification checklists for electrical systems while the Work is being installed. The intent is for the installing tradesperson to fill out and sign the installation verification checklist as work proceeds to improve the quality of the installation. Retain completed installation verification checklists on site for review.

F. Before performing a commissioning test, installation verification checklists must be performed and completed by QC inspector designated for the appropriate area specified here in and within the Contractors Quality Control Inspection and Test Plan as part of 01 45 00. Submit completed installation verification checklists for work included in the commissioning test.

3.05 LEVEL 1 STATIC TESTS

A. 2608-ST-01: Insulation Resistance:

1. System/Equipment to be tested:

a. Insulation of conductors rated 100 amperes or greater.

b. Insulation of conductors for all motor loads.

c. Insulation of heat trace conductors.

[Designer: Include Heat Trace Conductor as a ST test based upon coordination with Mech/fire about applicability of Heat Trace].

2. Functions to be tested:

a. Insulation resistance.

3. Conditions of the Test:

a. Perform insulation resistance test on each conductor with respect to ground and adjacent conductors. Applied potential shall be 500 volts DC for 300 volt rated cable and 1000 volts DC for 600 volt rated cable.

b. Test duration shall be one (1) minute.

c. Include in Static Test Procedures and Data Forms submittal.

d. Test conditions for heat trace per manufacturer's test procedures.

4. Acceptable Results:

a. Insulation resistance tests shall meet the requirements of Exhibit A, Table 26 08 00 - A3.

b. Heat trace acceptance values per manufacturer's test procedures.

B. 2608-ST-02: Bolted Connection Torque:

1. System/Equipment to be tested:

a. Bolted connections for conductors rated 100 amperes or greater.

2. Functions to be tested:

a. Bolted connection torque.

3. Conditions of the Test:

a. Perform torque test for each conductor tested and terminated in an overcurrent device or bolted type connection.

b. Include in Static Test Procedures and Data Forms submittal.

4. Acceptable Results:

a. Bolted connection torque values shall meet the manufacturer's published values or the requirements of Exhibit A, Table 26 08 00 - A2.

b. Record the Acceptable Results for O&M documentation.

C. 2608-ST-03: Ground Resistance:

1. System/Equipment to be tested:

a. Grounding resistance.

b. Reference: Grounding and bonding for electrical systems as stated in the Contract Documents.

2. Functions to be tested:

   a. Grounding resistance.

   b. Ground continuity.

3. Conditions of test:

   a. Test the grounding system by the fall-of-potential method.

4. Acceptable Results:

   a. Station grounding system: 10 ohms, maximum.

   b. Communications and Train Control System grounding electrode: 25 ohms, maximum.

   c. Traction Power Substation: 5 ohms, maximum.

   d. Tie Station grounding electrode: 5 ohms, maximum.

   e. OCS Foundation: 25 ohms, maximum.

   f. OCS Foundation with surge arrester: 5 ohms, maximum.

D. 2608-ST-04: Lighting Systems Illuminance Levels:

1. Equipment/Systems to be tested:

   a. Lighting Levels throughout.

      1) Normal circuits.

      2) Emergency circuits.

   b. Lighting Levels with dimming, occupancy, and daylighting sensor.

      1) Normal circuits.

      2) Emergency circuits.

2. Functions to be tested:

   a. Measure footcandle levels at random locations of the floor area. Include area outlined in Table 1007-4, Table 1007-5, and Table 1007-6 in the Requirements Set 1007.

   b. Measurements shall be taken to the following areas specified in the Table 1007-4, Table 1007-5, and Table 1007-6 in the Requirement Set 1007 and documented.

      [Designer: apply only areas that applicable.]

3. Conditions of Test:

   a. Areas are complete, cleaned, and no obstructions such as construction debris where the light measurement will be taken from.

   b. For exterior lighting, measurement must be taken when sky is completely dark.

c. Measurement must be taken between light fixtures, and not under the light fixture:

1) Few measurements must be taken when the light level requirement specified average.

4. Acceptable Results:

a. Light levels meet the requirement specified in the Table 1007-4, Table 1007-5, and Table 1007-6 in the Requirements Set 1007.

[Designer: apply only areas that applicable.]

b. Provide floor plan and indicates where the measurement is taken.

E. 2608-ST-05: Circuit Continuity and Phase Relationship:

1. Equipment/Systems to be tested:

a. Branch circuits and feeders throughout.

2. Functions to be tested:

a. Measure circuit continuity, phasing, and phase rotation at random locations of the floor area. Measurements shall be taken at the following areas and documented.

1) All lighting circuits.

a) Normal circuits.

b) Emergency Egress circuits.

2) All power branch circuits:

a) Normal circuits.

b) Emergency or Critical circuits.

3) Elevator Machine and Escalator Motor Feeders.

4) Electrical Rooms Switchboard and Panelboard Feeders.

5) Mechanical Room HVAC and Plumbing Feeders.

6) Ancillary Room Equipment Feeders.

7) Generator Feeder.

8) UPS Feeders.

9) VFD Feeders.

10) Photovoltaic System Feeders.

11) Electric Vehicle Feeders.

3. Conditions of Test:

a. Areas are complete and cleaned.

4. Acceptable Results:

   a. The Contractor shall test all electrical feeders and exterior branch circuits whose operating voltage is 600 volts or less that are installed under this contract and exterior branch circuits. The Testing and Commissioning Manager shall verify tests and submit a test report.

   b. Test for continuity of each circuit.

   c. Phase Relationship Tests: Check connections to all new and existing equipment for proper phase and phase rotation relationship. During check, disconnect all devices which could be damaged by the application of voltage or reversed phase sequence.

3.06 LEVEL 1 COMPONENT TESTS

A. 2608-C-01: Instrument Transformers:

1. Systems/Equipment to be tested:

   a. Current Transformers.

   b. Potential Transformers.

2. Functions to be tested:

   a. Insulation resistance.

   b. Ratio verification.

   c. Polarity.

   d. Transformer withdrawal mechanism.

   e. Phase rotation.

   f. Fuse sizes on primary and secondary on potential transformers.

   g. Interlock function and contact operation.

   h. Grounding and shorting connections.

   i. Secondary voltage.

   j. Secondary wiring integrity.

3. Conditions of test – Current Transformers:

   a. Perform insulation resistance test of the current transformer and current transformer wiring to ground at 500 volts DC for 30 seconds. Disconnect ground connection at ground connection point in the circuit for this test. Do not perform on solid-state devices.

   b. Perform a polarity test of each current transformer.

   c. Perform a ratio verification test of each current transformer. This shall be performed using the voltage method or current method in accordance with IEEE C57.13.2.

   d. Perform a DC dielectric withstand ability test on the primary windings with the secondary windings connected to ground.

4. Conditions of test – Potential Transformers:

   a. Perform insulation resistance tests on voltage transformers, winding-to-winding, and windings-to-ground.

   b. Perform a polarity test on each transformer to verify the polarity marks or H1-X1 relationship. The test may be performed with a TTR type ratio set.

   c. Perform a ratio test using a Transformer Turns Ratio (TTR) test set or by the voltage comparison method.

   d. Perform a DC dielectric withstand ability test on the primary windings with the secondary windings connected to ground.

   e. Verify secondary voltage by energized the primary winding with system voltage. Measure secondary voltage with the secondary wiring disconnected.

   f. Perform secondary wiring integrity test. Disconnect transformer at secondary terminals and connect secondary wiring to proper secondary voltage.

5. Acceptable Results – Current Transformers:

   a. Insulation resistance test voltages and minimum resistances shall be in accordance with Exhibit A, Table 26 08 00 – A3, in this specification. Do not perform this test where solid state devices are utilized.

   b. Polarity is verified correct.

   c. Ratios are verified correct.

   d. DC dielectric withstand ability is in accordance with Paragraph 8.8.2 and Tables 2 and 7 of ANSI/IEEE C57.13-1993 (Standard Requirements for Instrument Transformers).

6. Acceptable Results – Potential Transformers:

   a. Insulation resistance test voltages and minimum resistances shall be in accordance with Exhibit A, Table 26 08 00 – A3. Do not perform this test where solid state devices are utilized.

   b. Polarity is verified correct.

   c. Ratios are verified correct.

   d. DC dielectric withstand ability is in accordance with Paragraph 8.8.2 and Tables 2 and 7 of ANSI/IEEE C57.13-1993 (Standard Requirements for Instrument Transformers).

   e. Secondary voltage is verified correct.

   f. Proper potential at all devices.

B. 2608-C-02: Metering and Instrumentation:

1. Systems/Equipment to be tested:

   a. Meters:

1) Connection to Sound Transit, see Section 25 08 00 – Commissioning of Field Control System.

2. Functions to be tested:

a. Calibration at all cardinal points.

b. Instrument multipliers.

c. Tightness of electrical connections.

3. Conditions of test:

a. Verify accuracy of meters at all cardinal points

b. Verify all instrument multipliers.

c. Verify that current transformer and voltage transformer circuits are intact.

4. Acceptable Results:

a. Meter accuracy is verified correct.

b. Instrument multipliers are correct for application.

3.07 LEVEL 1 EQUIPMENT TESTS

A. 2608-E-01: Molded Case Circuit Breakers

1. System/Equipment to be tested:

a. Molded case circuit breakers serving switchboards, distribution panelboards, panelboards, central battery inverters, UPS, elevators, escalators, and mechanical equipment.

b. 3-phase molded case circuit breakers 60 amperes and greater.

2. Functions to be tested:

a. Contact resistance.

b. Insulation resistance.

c. Verification of adjustments for final settings.

d. Tightness of electrical connections.

e. Performance characteristics of trip units based on coordination studies.

3. Conditions of the test:

a. Perform a contact resistance test or millivolt drop across contacts at rated current.

b. Perform an insulation resistance test from pole-to-pole and from each pole-to-ground with breaker closed and across open contacts of each phase per Exhibit A, Table 26 08 00 – A3.

c. Perform adjustments for final settings in accordance with Coordination Study supplied by Contractor.

d. Perform primary current injection tests to ensure performance characteristics of trip units.

e. Check trip unit reset operation.

4. Acceptable Results:

a. Compare microohm or millivolt drop values to adjacent poles and similar breakers. Investigate, correct and re-test deviations of greater than 50 percent.

b. Insulation resistance shall be per Exhibit A, Table 26 08 00 - A3

c. All instantaneous trip times shall fall within manufacturer's time-current curves or use NEMA Standard AB4-1991 Table 5-3. Circuit breakers exceeding specified trip time at 300 percent of pickup shall be tagged defective.

d. Trip unit setpoints match those listed in the final Short Circuit/Coordination/Arc Flash study report.

B. 2608-E-02: Medium Voltage Power Circuit Breakers

1. System/Equipment to be tested.

a. Medium voltage power circuit breakers.

2. Functions to be tested.

a. Test in compliance with the manufacturer's recommendation.

b. Test per Section 26 13 13 - Medium-Voltage AC Circuit Breaker Switchgear, Articles 2.11 and 2.13.

3. Acceptable results

a. Complies with manufacturer's recommendations.

b. All results in accordance with IEEE C37.20.2, IEEE C37.09. and IEEE C57.13.

C. 2608-E-03: Low Voltage Power Circuit Breakers

1. System/Equipment to be tested.

a. Low voltage power circuit breakers serving switchboards, distribution panelboards, panelboards, central battery inverters, UPS, elevators, escalators, and mechanical equipment.

b. Low voltage power circuit breakers 60 amperes and greater.

2. Functions to be tested:

a. Contact resistance.

b. Insulation resistance.

c. Verification of adjustments for final settings.

d. Tightness of electrical connections.

e. Long-time pickup and Long-time delay time-current characteristics.

f. Short-time pickup and delay.

g. Ground fault pickup and delay.

h. Operation of any auxiliary features such as trip and pickup indicators, zone interlocking, electrical close and trip operation, trip-free, and anti-pump function.

i. Trip unit reset operation based on coordination studies.

3. Conditions of the test:

a. Perform a contact resistance test or millivolt drop across contacts at rated current.

b. Perform an insulation resistance test from pole-to-pole and from each pole-to-ground with breaker closed and across open contacts of each phase per Exhibit A, Table 26 08 00 – A3.

c. Perform primary current injection tests to ensure performance characteristics of trip units.

d. Using the settings from the final Coordination Study, perform long-time pickup and long-time delay time-current characteristic tests by passing 300 percent rated current through each pole separately.

e. Using the settings from the final Coordination Study, determine short-time pickup and short-time delay by primary current injection.

f. Using the settings from the final Coordination Study, determine instantaneous pickup by primary current injection using run-up or pulse method.

g. Using the settings from the final Coordination Study, determine ground fault pickup and time delay by primary current injection.

h. Verify the correct operation of any auxiliary features such as trip and pickup indicators, zone interlocking, electrical close and trip operation, trip-free, and anti-pump function.

i. Check trip unit reset operation.

j. Check key and other interlock safety devices for operation and sequence. Make closing attempts on locked-open and opening attempts on locked-closed devices including barriers and shutters.

k. Test the correct operation of the electrical lockout feature on the tie breaker.

4. Acceptable Results:

a. Compare microohm or millivolt drop values to adjacent poles and similar breakers. Investigate, correct and re-test deviations of greater than 50 percent.

b. Insulation resistance values shall be per Exhibit A, Table 26 08 00 - A3

c. Instantaneous pickup value shall be per NEMA Publication AB4-1991, Table 5-4.

d. Trip characteristics of breakers shall fall within manufacturer's published time current tolerance band including all adjustment factors.

e. Trip unit setpoints match those listed in the final Short Circuit/Coordination/Arc Flash study report.

D. 2608-E-04: Ground Fault Protection System

1. System/Equipment to be tested:

   a. Ground Fault Protection System.

2. Functions to be tested:

   a. Adjustable trip and time delay functions.

   b. Trip unit reset operation.

   c. Circuit interrupting device.

   d. Relay pickup current.

   e. Relay time delay.

   f. Ground monitor panel where applicable.

   g. Sensor polarity on phase and neutral sensors.

   h. Indicator lights and flags.

3. Conditions of test:

   a. Set the adjustable trip and time delay functions based on the data generated from the ground fault system study.

   b. Verify trip unit reset operation.

   c. Test correct response of the circuit interrupting device by using ground sensor current injection to measure Relay pickup current.

   d. Test correct response of the circuit interrupting device by using ground sensor current injection to measure Relay Time Delay. (Measure at two values above pickup current).

   e. Verify proper sensor polarity on phase and neutral sensors.

   f. Functionally check operation of ground fault indicator lights and flags for correct indication of ground fault trip.

4. Acceptable Results:

   a. Trip unit resets properly.

   b. Adjustable trip and time delay functions correspond to settings generated in the ground fault system study.

   c. Circuit interrupting device operates properly.

d. Ground fault indicator lights and flags operate properly.

e. Trip unit setpoints match those listed in the final Short Circuit/Coordination/Arc Flash study report.

E. 2608-E-05: Dry Type Medium Voltage Transformers

1. Systems/Equipment to be tested:

a. Dry type transformers.

2. Functions to be tested:

a. Insulation resistance.

b. Reference: Low voltage transformers requirements as stated in the Contract Documents.

3. Conditions of test:

a. Perform insulation resistance test. Measurements shall be made from winding-to-winding and winding-to-ground.

4. Acceptable Results:

a. Test voltages and minimum resistances shall be in accordance with Exhibit A Table 26 08 00 - A1. Results to be temperature corrected in accordance with Exhibit A Table 26 08 00 - A4.

b. Verify and record taps and connect transformer to desired tap.

c. Verify correct phase rotation.

F. 2608-E-06: Switchboards

1. System/Equipment to be tested:

a. Switchboards.

b. Distribution Panelboards.

c. Branch Circuit Panelboards.

2. Functions to be tested:

a. Insulation resistance.

b. Phase rotation.

c. Reference: Switchboard requirements as stated in the Contract Documents.

3. Conditions of test:

a. Perform insulation resistance test phase-to-phase and phase-to-ground of each bus section.

4. Acceptable Results:

a. Insulation resistance test voltages and minimum resistances shall be in accordance with Exhibit A, Table 26 08 00 - A3.

b. Phase rotation shall be compatible with the serving utility.

G. 2608-E-07: Motor Control Equipment:

1. Systems/Equipment to be tested:

a. Motor starters.

b. Enclosed motor controllers (general purpose, across-the-line starters).

c. Variable Frequency Drives.

2. Functions to be tested (All motor control equipment):

a. Insulation resistance.

b. Overload unit operation with setpoint per service factor, FLA and NEC Article 430.

c. Control devices.

d. Phase rotation.

3. Additional Functions to be tested (Variable Frequency Drives):

a. Check motor rotation when operating on the drive and the bypass.

b. Verify Critical frequencies to be avoided (jumped) during operation by varying speed from minimum to maximum and observing motor for unusual vibration and noise.

c. Operate from remote start-stop and speed control signals.

4. Conditions of test:

a. Measure insulation resistance of each starter phase-to-phase and phase-to-ground with the starter contacts closed and the protective device open.

b. Measure insulation resistance of each control circuit with respect to ground.

c. Verify and confirm the motor requirement specified in Division 22 and Division 23 Commissioning specification.

d. Test motor overload units (except solid-state type) by injecting primary current through overload unit and monitoring trip time at 300 percent of motor full load current.

e. Perform operational tests by initiating control devices to affect proper operation.

f. Verify installation in accordance with manufacturer’s instructions and in accordance with visual and mechanical inspection requirements.

g. VFD programmable parameter settings established.

h. VFD jump frequency settings coordinated.

i. VFD power failure recovery restart settings coordinated.

5. Acceptable Results:

a. Insulation resistance test voltages and minimum resistances shall be in accordance with manufacturer's published data. Manufacturer shall be consulted for test voltage where solid state devices are utilized.

b. Overload tests shall be in accordance with manufacturer's tolerances. Investigate values more than 120 seconds.

c. Phase rotation shall be compatible with the serving utility.

d. Installation in compliance with manufacturer's procedures and criteria.

e. VFD parameter settings reviewed and signed off by HVAC and electrical contractors. Record all settings for use by Sound Transit.

f. VFD jump settings reviewed and signed off by HVAC and electrical contractors. Record all settings for use by Sound Transit.

g. VFD power failure recovery restart settings reviewed and signed off by HVAC and electrical contractors. Record all settings for use by Sound Transit.

h. Following successful completion of testing specified for Soft Start motors outlined in commissioning of HVAC systems as stated in the Contract Documents, record all settings for use by Sound Transit.

H. 2608-E-08: Receptacles:

1. Equipment to be tested:

a. Receptacles standard.

b. Receptacles Ground Fault Circuit Interrupter (GFCI).

2. Functions to be tested:

a. Open ground.

b. Reverse polarity.

c. Open hot.

d. Open neutral.

e. Hot and ground reversed.

f. Ground Fault Receptacle Circuit Interrupter when so equipped.

3. Conditions of the test:

a. Perform all tests with adjustable GFCI and circuit tester.

b. GFCI TEST button on receptacle not acceptable for test.

4. Acceptable Results:

a. Tester indicates correct wiring.

b. GFCI trips on ground fault current 5 milliamperes or greater.

c. GFCI does not trip on ground fault current less than 5 milliamperes.

I. 2608-E-09: Interior Lighting Control Devices

1. Systems/Equipment to be tested for both normal and emergency circuits in interior application:

   a. Manual Light Switch:

      1) 3-way Light Switch.

   b. Occupancy Sensors (ceiling or wall mount).

   c. Vacancy Sensors (ceiling or wall mount).

   d. Daylighting Sensors (integral or external to the light fixture).

   e. Motion Sensors (integral or external to the light fixture).

2. Functions to be tested:

   a. Manually turns light on and off:

      1) 3-way light switch manually turns light on and off.

   b. Automatic control of lighting fixtures.

   c. Manual override of automatic function.

3. Conditions of the test:

   a. Verify all settings of the sensors match the controls sequence of operation and record all settings.

   b. For manual light switch:

      1) Manually turns lights on when manual light switch toggle to ON position.

      2) Manually turns lights off when manual light switch toggle to OFF position.

      3) For 3-way light switches, manually turns lights on when one of the manual light switch toggles to ON position. Then manually turns lights off when the other manual light switch toggles to OFF position. Then reverse the test from one manual light switch to another manual light switch.

   c. For occupancy sensor:

      1) After device has timed out, walk into the space to verify initial response to sensing occupancy.

      2) Leave space to verify response to the unit not sensing occupancy for a certain amount of time that lights turn off.

      [Designer: when occupancy sensor has dual sensor such as passive-infrared (PIR) sensor, ultrasonic sensor, dual-technology sensor, microwave sensor, or acoustic sensors specified in the controls sequence of operation, then test the sensor separately. Sensor not specified above must test according to manufacturer's recommendation.]

d. For vacancy sensor:

1) Manually turns lights on.

2) Leave space to verify response to the unit not sensing occupancy for a certain amount of time that lights turn off.

e. Operate light switches to verify response.

f. For Daylighting Sensor:

1) Check placement of the daylight sensor.

2) Testing must be done during the daytime and nighttime.

a) Daytime test, test the dimming ability of the sensor when outside daylight shines upon the room.

b) Nighttime test, test the brightening ability of the sensor when there is no outside daylight available.

3) Test with varying amount of light into the daylighting zones.

4) Test the footcandle minimum illumination of the fixtures at maximum dimming when there is no sunlight coming into the daylighting zones.

5) When necessary, relocated and calibrated the sensor to track interior daylight levels.

g. Motion sensors:

1) Test the function of the motion sensor switching capability for lights to dim when sensor do not detect any movement.

2) Test the function of the motion sensor when sensor detects movement, light turns back to 100 percent.

4. Acceptable Results:

a. For manual light switch, turn lights on when light switch toggles to ON position and turn lights off when light switch toggles to OFF position.

1) Similar concept in 3-way manual light switches.

b. Occupancy Sensor:

1) Occupancy sensors turn on selected light fixtures upon first entering the room.

2) Initially the occupancy sensor will turn off the light fixtures but will automatically turn the light fixtures back on after occupancy sensor detects movement.

3) Occupancy sensor turns lights off per setting specified in the control sequence of operation.

4) Upon the sensor not sensing occupancy for the timed delay duration, the device automatically turns off the room light fixtures.

5) The sensor is not affected by HVAC noise or heat or other external factors that would prevent the fixtures from turning off automatically when there is no occupancy for the set time-out duration.

c. Vacancy Sensor:

1) Vacancy sensors require that the occupant manually turn on the light switch when first entering the room.

2) Prior to the sensor timing out, the light switch can be turned to the OFF position to turn the lights off within the room and the lights will remain off when the occupant enters the room.

3) Vacancy sensor turns light off per setting specified in the control sequence of operation.

d. Daylighting Sensor:

1) All required fixtures within the daylighting zones dim with more sunlight into the zone.

2) All required fixtures within the daylighting zone brighten as sunlight into the zone diminishes.

3) The primary zone fixtures dim first and reach minimum lighting levels prior to the secondary zone fixtures dimming and reaching their minimum lighting levels.

4) The space lighting levels do not dim to less than the design required minimum footcandle levels within the daylighting zones.

e. Motion Sensor:

1) Lights automatically reduced when there is no activity detected within the lighting zone.

2) Lights automatically turns back to 100 percent when there is activity detected within the lighting zone.

3) Dimming percent and time for no detection based on the control sequence of operation.

J. 2608-E-10: Exterior Lighting Control Devices

1. Systems/Equipment to be tested for exterior application for normal and emergency lighting:

a. Motion Sensor (integral or external to the light fixture)

b. Photocell.

c. Lighting control time clocks (relay control panels)

2. Functions to be tested:

a. Automatic control of lighting loads.

b. Manual override of automatic function.

c. Relay status

d. Schedule modifications

e. Network Interface

3. Conditions of the test:

   a. Verify all settings of the sensors match the controls sequence of operation and record all settings.

   b. Motion Sensor:

      1) Test the function of the motion sensor switching capability for lights to dim when sensor do not detect any movement.

      2) Test the function of the motion sensor when sensor detects movement, light turns back to 100 percent.

   c. Photocell:

      1) Photocell must be clean and free of debris.

      2) Test the function of the sensor switching capability for lights off during daytime and lights on during the nighttime or dust-to-dawn.

4. Acceptable Results:

   a. Motion Sensor:

      1) Lights automatically reduced when there is no activity detected within the lighting zone.

      2) Lights automatically turns back to 100 percent when there is activity detected within the lighting zone.

      3) Dimming percent (%) and time for no detection based on the control sequence of operation.

   b. Photocell:

      1) All required lights turn off during daytime and lights turns on during nighttime or dust-to-dawn function.

   c. Lighting Control time clocks (relay controls).

      1) Demonstrate automatic control via controller CPU to schedule the exterior fixtures and lighting circuits on and off based on a built-in astronomical clock schedule.

      2) Manually override all automatic functions to control lights regardless of time-of-day schedule or daylight control requirement.

      3) Verify relay status.

      4) Demonstrate time control and the ability to modify schedules.

      5) Demonstrate override control of the light control system via the network lighting controller.

K. 2608-E-11: Egress Fixtures and Exit Signs

1. Systems/Equipment to be tested:

   a. Egress fixtures and exit signs.

2. Functions to be tested:

   a. Operation under facility normal electrical power service

   b. Operation under facility emergency electrical power service via central battery inverter.

3. Conditions of the test:

   a. Verify location of egress fixtures and exit signs match the Contract Document.

   b. Facility is served by normal electrical power source.

   c. Simulate loss of facility normal electrical power source by switching off main normal power to the building at the main entrance switchgear.

4. Acceptable Results:

   a. Under normal power, egress fixtures are controlled by the lighting control systems per their normal sequence of operation and turn off and dim accordingly per the lighting low voltage relay panel schedules, occupancy sensors, and daylighting controls. Exit signs always remain on.

   b. After a power loss, all egress fixtures and exit signs re-illuminate fully within 10 seconds of the start of the power loss event and remain on for a minimum of 90 minutes.

   c. All egress fixtures and exit signs return to normal operation when normal power service is restored to the facility and central battery inverter starts recharging.

L. 2608-E-12: Transfer Switches

1. System/Equipment to be tested.

   a. Transfer Switch

   [Designer: clarify the use of transfer switch should this be Manual or Automatic based on the design.]

2. Functions to be tested:

   a. Load transfer to alternate standby power (mobile generator).

   b. Load transfer to normal utility power.

   c. Verification of adjustments for final settings.

   d. Tightness of electrical connections.

3. Conditions of the test:

   a. Facility is served by normal utility power source.

b. Simulate loss of facility normal utility power source by switching off main normal power to the building at the service entrance. Simulate outage with emergency and communication systems running on battery backup.

c. Do not manually operate the transfer switch until both power sources are disconnected: open both normal and standby source circuit breakers.

d. Use the maintenance handle to manually operate transfer switch. Comply with manufacturer's "Manual Operations Test" procedures and instruction requirements.

e. Review manufacturer's control features operation prior to activation on switch control sequence

4. Acceptable Results:

a. The transfer switch does not retransfer the electrical load automatically.

b. The mobile generator is not stopped automatically.

c. Documentation of testing procedures, adjustments/settings, and results in compliance with NFPA 110 acceptance testing and manufacturer's testing instructions.

d. Documentation of verification and confirmation of transfer switch and mobile generator compatibility.

e. Loads run normally when generator power is connected and after transfer back to normal power.

f. No damage to equipment

R. 2608-E-13: Generator Receptacle

a. System / Equipment to be tested:

1) Enclosed Generator Receptacle

b. Functions to be tested:

1) Open ground

2) Phasing

3) Open hot

4) Open neutral

5) Hot and ground reversed.

c. 3. Conditions of the test:

1) Perform all tests and document the results for the functional test

d. Acceptable Results:

1) Tester indicates correct wiring.

M. 2608-E-14: Safety Switched and Enclosed Circuit Breakers

1. System/Equipment to be tested.

   a. Fused Disconnect

   b. Enclosed Circuit Breaker

2. Functions to be tested:

   a. Contact resistance.

   b. Insulation resistance.

   c. Verification of adjustments for final settings.

   d. Tightness of electrical connections.

   e. Long-time pickup and Long-time delay time-current characteristics.

   f. Short-time pickup and delay.

   g. Ground fault pickup and delay.

   h. Operation of any auxiliary features such as trip and pickup indicators, electrical close and trip operation, and trip-free.

   i. Trip unit reset operation based on coordination studies.

3. Conditions of the test:

   a. Perform a contact resistance test or millivolt drop across contacts at rated current.

   b. Perform an insulation resistance test from pole-to-pole and from each pole-to-ground with breaker closed and across open contacts of each phase per Exhibit A, Table 26 08 00 – A3.

   c. Perform primary current injection tests to ensure performance characteristics of trip units.

   d. Using the settings from the final Coordination Study, perform long-time pickup and long-time delay time-current characteristic tests by passing 300 percent rated current through each pole separately.

   e. Using the settings from the final Coordination Study, determine short-time pickup and short-time delay by primary current injection.

   f. Using the settings from the final Coordination Study, determine instantaneous pickup by primary current injection using run-up or pulse method.

   g. Using the settings from the final Coordination Study, determine ground fault pickup and time delay by primary current injection.

   h. Verify the correct operation of any auxiliary features such as trip and pickup indicators, zone interlocking, electrical close and trip operation, trip-free, and anti-pump function.

   i. Check trip unit reset operation.

j. Check key and other interlock safety devices for operation and sequence. Make closing attempts on locked-open and opening attempts on locked-closed devices including barriers and shutters.

k. Test the correct operation of the electrical lockout feature on the tie breaker.

l. Test fuse clips and ON/OFF handle.

4. Acceptable Results:

a. Compare microohm or millivolt drop values to adjacent poles and similar breakers. Investigate, correct and re-test deviations of greater than 50 percent.

b. Insulation resistance values shall be per Exhibit A, Table 26 08 00 - A3

c. Instantaneous pickup value shall be per NEMA Publication AB4-1991, Table 5-4.

d. Trip characteristics of breakers shall fall within manufacturer's published time current tolerance band including all adjustment factors.

e. Trip unit setpoints match those listed in the final Short Circuit/Coordination/Arc Flash study report.

3.08 LEVEL 1 SYSTEM TESTS

A. As described under the Systems Contract.

B. 2608-S-01 Standby Generator Functional Test:

[Designer: determine that the functional test is applicable to the project.]

1. Systems/Equipment to be tested:

a. Generator.

b. Automatic Transfer Switches.

c. Interface to BMS.

d. Interface to Fire Alarm.

[Designer: determine that the interface to fire alarm is applicable.]

e. Interface to elevator(s) and Elevator Machine Room(s)

[Designer: determine that the interface to elevator(s) and Elevator Machine Room(s) are applicable.]

f. Facility Equipment Under Emergency Power and Transition Conditions.

2. Functions to be tested:

a. Generator on-board controls and interfaces to electrical system via transfer switch.

b. Automatic transfer switch operation and interfaces to electrical system switchboards and panelboards.

c. Interfaces of generator and ATS to BMS.

d. Interfaces of generator and ATS to fire alarm.

[Designer: determine that the interfaces of generator and ATS to fire alarm is applicable.]

e. Interfaces of generator to elevator(s) and Elevator Machine Rooms(s).

[Designer: determine that the interfaces of generator to elevator(s) and Elevator Machine Room(s) are applicable.]

3. Conditions of the test:

a. Generator:

1) Test all components, equipment, and integral on-board controls of the generator, including all component, equipment, and system operating observations and modes of operation, per the manufacturer's recommended methods and as applicable for field observations and testing.

b. Automatic Transfer Switch:

1) Test all components, equipment, and integral on-board controls of the automatic transfer switch, including all component, equipment, and system operating observations and modes of operation, per the manufacturer's recommended methods and as applicable for field observations and testing.

2) Test interfaces to generator for signaling of standard interface and coordination points including call for generator start, normal and alternate power source availability, automatic and manual posturing controls and operations, generator cooldown, phase synchronization transfer controls, etc.

3) Test that phase rotation from generator to ATS matches the normal utility service source phase rotation.

c. Interface to BMS:

1) Test all monitored points between the generator and ATS.

d. Interfaces to Fire Alarm System:

[Designer: determine that the interface to Fire Alarm System is applicable.]

1) Test all monitored points between the generator and ATS.

e. Interface to Elevator(s) and Elevator Machine Room(s):

[Designer: determine that the interface to elevator(s) and Elevator Machine Room(s) are applicable.]

1) Test for Concurrent Maximum Load Measurement.

a) Load elevator up with as many people as possible and travel from lowest floor stop to highest floor stop.

b) Alternatively, the L&I elevator testing may have recorded the maximum amp loading for the elevator equipment when the elevator max load testing was conducted. Use that data, if available.

2) Test all elevator equipment, controls and 120V distribution panel inside the Elevator Machine Room(s).

f. Building Blackout and Recovery Test:

1) Coordinate with all affected subcontractors and lead a building blackout and recovery test for the facility.

a) This test shall be conducted when the affected equipment and systems have been substantially commissioned so that their operation under normal power, loss of normal power, transition and running under emergency power, and transition and running back to normal power can be verified.

b) Conduct this test with all subcontractors observing their respective equipment and systems during this test.

2) Open the normal electrical utility service breaker to simulate a normal power loss condition for the facility.

3) Verify the emergency electrical service timing for emergency lighting to ensure that it is restored within 10 seconds of normal service loss.

4) Wait for the others to observe the reaction of their equipment and systems under loss of power conditions and as the systems transition and run under the generator (observations include the emergency central battery inverters (or UPS)). Then, after all observations are complete, close the breaker for normal electrical power service.

5) Wait for the others to observe the reaction of their equipment and systems under transfer back from emergency to normal source. If the observed equipment and systems do not operate per design and per the manufacturer’s documentation, conduct the test again until all observed equipment and systems operate correctly.

4. Acceptance Criteria:

a. Generator:

1) Verify all components, equipment, and integral on-board controls of the generator, including all component, equipment, and system operating observations and modes of operation, operate per the design requirements and the manufacturer’s operation manuals.

b. Automatic Transfer Switch:

1) Verify all components, equipment, and integral on-board controls of the generator, including all component, equipment, and system operating observations, and modes of operation, operate

per the design requirements and the manufacturer's operation manuals.

2) Verify that all control and monitoring points between the generator and automatic transfer switch work correctly to provide a fully operational system.

3) Verify that the phase rotation from generator matches the normal utility service source phase rotation where they both input to the ATS.

c. Interfaces to BMS:

1) Verify all monitored points between the generator and ATS and the BMS.

d. Interfaces to Fire Alarm System:

[Designer: determine that the interface to Fire Alarm System is applicable.]

1) Verify all monitored points between the generator and ATS and the fire alarm system.

e. Interfaces to elevator(s) and Elevator Machine Room(s):

[*Designer: determine that the interface to elevator(s) and Elevator Machine Room(s) are applicable.]*

1) Verify elevator(s) works under generator power and operates with Maximum Load from lowest floor stop to highest floor stop.

2) Verify all elevator equipment, controls and 120V panel works under generator power inside the Elevator Machine Room(s).

f. Building Blackout and Recovery Test:

1) The generator and automatic transfer switch operate correctly to provide normal utility electrical service to the facility when it is available and to automatically switch service to facility emergency power distribution loads when normal utility electrical service is lost.

2) The emergency life safety circuits and equipment return to operation, under emergency power, within 10 seconds of power loss (note that these functions are energized at least initially via the central battery inverter (or UPS).

3) The equipment that is not served by emergency power circuits immediately stops and does not come back on under generator operation.

4) The equipment that is served by emergency power circuits may initially stop but come back on after generator power is supplied to those circuits and that they automatically restart with no nuisance alarms or the requirement for operator interventions to restart them.

5) When the utility service is restored, the transfer switch automatically transfers once again provide normal utility power

service to the building and the generator cools down and stops automatically.

6) When the transition back to normal occurs, the equipment served by emergency power circuits remain operational, without nuisance alarms or failures due to the transition.

7) When normal power service is restored, the equipment and systems not served by emergency circuits automatically restart with no nuisance alarms or the requirement for operator interventions to restart them.

C. 2608-S-02 Portable Generator Functional Test – Stations

[Designer: determine that the functional test is applicable to the project.]

1. System / Equipment to be tested:

   a. Operation of system on portable generator.

   b. Interface to elevator(s) and Elevator Machine Room(s)

   [Designer: determine that the interface to elevator(s) and Elevator Machine Room(s) are applicable.]

2. Functions to be tested:

   a. Connection of portable generator to generator receptacle.

   b. Startup of generator and transfer of Station loads via Manual Transfer Switch.

   c. Operation of Station loads while running on generator power. Run Station loads for a minimum of 30 minutes.

   d. Transfer of Station loads back to normal power via the Manual Transfer Switch.

   e. Interfaces of generator to elevator(s) and Elevator Machine Rooms(s).

   [Designer: determine that the interfaces of generator to elevator(s) and Elevator Machine Room(s) are applicable.]

3. Conditions of the Test:

   a. Station under a simulated outage with emergency and communication systems running on battery backup.

   b. Contractor to provide a 200 kVA, 480 V, 3 phase, 4 wire portable generator with the matching connection to the 200A generator receptacle installed on site for the purposes of completing portable generator and manual transfer switch commissioning activities. Sound Transit owned portable generators may be used instead of contractor provided generator only if available. Coordinate use of Sound Transit owned portable generator with Resident Engineer.

   c. Measure generator receptacle phasing in the field and configure generator to match so that no phase shifting occurs when loads are transferred to the generator. Provide documentation of the phasing to the Resident Engineer.

d. Measure generator receptacle phasing in the field and verify the phases match the installation documentation, revise phases if required to match documented phases so the same generator can back up the station without requiring any modifications. Configure generator to match so that no phase shifting occurs when loads are transferred to the generator. Provide documentation of the phasing from the Station and provide to the Resident Engineer.

e. Interface to Elevator(s) and Elevator Machine Room(s):

[Designer: determine that the interface to elevator(s) and Elevator Machine Room(s) are applicable.]

1) Test for Concurrent Maximum Load Measurement.

a) Load elevator up with as many people as possible and travel from lowest floor stop to highest floor stop.

b) Alternatively, the L&I elevator testing may have recorded the maximum amp loading for the elevator equipment when the elevator max load testing was conducted. Use that data, if available.

2) Test all elevator equipment, controls and 120V distribution panel inside the Elevator Machine Room(s).

4. Acceptable Results:

a. Loads run normally when generator power is connected and after transfer back to normal power.

b. No damage to equipment

c. Verify that the Stations' generator receptacle phasing matches the Garage generator receptacle phasing and adjust wiring for the Garage so that the single generator provided for testing can plug into either receptacle or transfer the loads without causing a phase shift in either location.

d. Interfaces to elevator(s) and Elevator Machine Room(s):

[*Designer: determine that the interface to elevator(s) and Elevator Machine Room(s) are applicable.]*

1) Verify elevator(s) works under generator power and operates with Maximum Load from lowest floor stop to highest floor stop.

2) Verify all elevator equipment, controls and 120V panel works under generator power inside the Elevator Machine Room(s).

D. 2608-S-03 Portable Generator Functional Test – Garages:

[Designer: determine that the functional test is applicable to the project.]

1. System / Equipment to be tested:

a. Operation of system on portable generator.

b. Interface to elevator(s) and Elevator Machine Room(s)

[Designer: determine that the interface to elevator(s) and Elevator Machine Room(s) are applicable.]

2. Functions to be tested:

   a. Connection of portable generator to generator receptacle.

   b. Startup of generator and transfer of Garage loads via Manual Transfer Switch.

   c. Operation of Garage loads while running on generator power. Run Garage loads for a minimum of 30 minutes.

   d. Transfer of Garage loads back to normal power via the Manual Transfer Switch.

   e. Interfaces of generator to elevator(s) and Elevator Machine Rooms(s).

   [Designer: determine that the interfaces of generator to elevator(s) and Elevator Machine Room(s) are applicable.]

3. Conditions of the Test:

   a. Garage under a simulated outage with emergency and communication systems running on battery backup.

   b. Contractor to provide a 3 phase, 4 wire portable generator with the matching connection to the generator receptacle installed on site.

   c. Measure generator receptacle phasing in the field and configure generator to match so that no phase shifting occurs when loads are transferred to the generator. Provide documentation of the phasing to the Resident Engineer.

   d. Measure generator receptacle phasing in the field and verify the phases match the installation documentation from the contract, revise phases if required to match documented phases so the same generator can backup other Sound Transit locations without requiring any modifications. Configure generator to match so that no phase shifting occurs when loads are transferred to the generator. Provide documentation of the phasing to the Resident Engineer.

   e. Interface to Elevator(s) and Elevator Machine Room(s):

      [Designer: determine that the interface to elevator(s) and Elevator Machine Room(s) are applicable.]

      1) Test for Concurrent Maximum Load Measurement.

         a) Load elevator up with as many people as possible and travel from lowest floor stop to highest floor stop.

         b) Alternatively, the L&I elevator testing may have recorded the maximum amp loading for the elevator equipment when the elevator max load testing was conducted. Use that data, if available.

      2) Test all elevator equipment, controls and 120V distribution panel inside the Elevator Machine Room(s).

4. Acceptable Results:

   a. Loads run normally when generator power is connected and after transfer back to normal power.

   b. No damage to equipment.

   c. Interfaces to elevator(s) and Elevator Machine Room(s):

      [*Designer: determine that the interface to elevator(s) and Elevator Machine Room(s) are applicable.]*

      1) Verify elevator(s) works under generator power and operates with Maximum Load from lowest floor stop to highest floor stop.

      2) Verify all elevator equipment, controls and 120V panel works under generator power inside the Elevator Machine Room(s).

E. 2608-S-04: Central Battery Inverter and Uninterruptible Power Supply:

1. System/Equipment to be tested:

   a. Central Battery Inverter.

   b. Uninterruptible Power Supply.

2. Functions to be tested:

   a. Normal and bypass operation including bypass function.

   b. Local alarms.

   c. Remote communications.

   d. Battery supply.

   e. Output voltage (by vendor).

   f. Battery monitoring (by vendor).

   g. Connection torque (by vendor).

3. Conditions of test:

   a. Test the normal and bypass operation of the inverter/UPS using resistive load banks to simulate all types of load conditions.

   b. Test protective and alarm functions.

   c. Test monitoring capabilities locally and remotely.

   d. Perform a 15-minute battery rundown test.

   e. Provide documentation that overload capacity testing was performed by manufacturer.

   f. Install power recording meters to record all unit parameters under actual load conditions. Meters to be installed at inverter/UPS and at panelboard served.

4. Acceptable Results:

a. Normal and bypass operation of inverter/UPS meets design criteria as stated in the Contract Documents. Provide record of input and output voltage and current at 25 percent, 50 percent, 75 percent and 100 percent load.

b. Remote monitoring location receives correct information regarding Unit Status, Unit Parameters and Unit Alarms.

c. Batteries are able to provide 15 minutes supply to loads with 75 minutes of capacity remaining under simulated full load when the inverter/UPS is disconnected from its power source.

d. Overload capacity meets design criteria as shown in manufacturer's test report. 125 percent for 10 minutes, 150 percent for 30 seconds.

F. 2608-S-05: Lighting Control Panels:

1. Systems/Equipment to be tested for both normal and emergency circuits in interior and exterior application:

a. Lighting Control Panels.

1) Override Manual Switch (see settings in lighting control sequence of operation).

2. Functions to be tested:

a. Lighting Control Panels:

1) Automatic control of lighting loads.

2) Manual override of automatic function.

3) Relay status.

4) Power failure and subsequent Power Up.

5) Daylight control settings.

6) Time control settings.

7) Network Interface.

3. Conditions of the test:

a. Lighting Control Panel:

1) Demonstrate automatic control via controller CPU.

2) Manually override all automatic functions to control lights regardless of time-of-day schedule or daylight control requirement.

3) Verify relay status.

4) Fail the incoming power to the controller for a period of 30 minutes. Failure of power to take place 10 minutes prior to a programmed change in the lighting control schedule. Restore power to the controller to verify time scheduled events that were

to take place during the power outage will be automatically activated.

5) Demonstrate daylight control by inhibiting the amount of light to the sensor.

6) Demonstrate time control and the ability to modify schedules.

7) Demonstrate override control of the light control system via the network lighting controller.

4. Acceptable Results:

a. Lighting Control Panel:

1) Automatic control satisfactorily operates per programmed schedules.

2) Manual override bypasses normal controller operation and turns on all lights.

3) Relay status feedback monitors actual status of each relay.

4) The controller activates in the correct operating status following failure of power.

5) Daylight sensor shall respond to diminished lighting. Measure light levels before and after inhibiting sensor.

6) Lighting controller operates satisfactorily following modification of time schedules.

7) Network lighting controller provides complete override control over the lighting system.

G. 2608-S-06: Photovoltaic Collectors:

[Designer: determine that the functional test is applicable to the project.]

1. System/Equipment to be tested:

a. Micro-Inverters.

b. Photovoltaic Modules.

c. AC & DC Overcurrent Protection Devices.

d. Photovoltaic Collectors Power Distribution.

2. Functions to be tested:

a. Insulation resistance.

b. Tightness of electrical connections.

c. Circuit breaker functions, as applicable.

3. Conditions of the test:

a. Perform a contact resistance test or millivolt drop across contacts at rated current.

b. Peak and lowest solar exposure.

c. Conditions for circuit breakers, as applicable

4. Acceptable Results:

a. Photovoltaic metering equipment provides metering of instantaneous and continuous KW and kWh output.

b. When applicable, check the cellular connectivity to remote monitoring system.

3.09 LEVEL 2 SYSTEM TESTING REQUIREMENTS

A. Systems checklists are required to include the following, at a minimum:

B. 2608-IS-01: Lighting System BMS Interface:

1. Systems to be tested:

a. Networked Lighting Systems.

2. Systems functions to be tested:

a. Hours of Operation.

b. Override On.

c. Trouble.

3. Conditions of the test: Refer to the control diagrams and Division 25 specifications for points lists.

a. Acceptance Criteria: All functions and communications indicated in the sequence of operation and points lists transmit correctly. For equipment provided with emergency electrical power service, the BMS interfaces and fan equipment automatically restart after power is transferred to an emergency power source without nuisance alarms or the need for operator intervention. When normal power is restored and power is transferred back to the normal power source, the BMS interfaces and fan equipment continue to operate without nuisance alarms or the need for operator intervention.

C. 2608-IS-02: Uninterruptible Power Supplies BMS Interface:

1. Systems to be tested:

a. Uninterruptible Power Supply Systems.

2. Systems functions to be tested:

a. Battery failure.

b. Power failure.

c. UPS on battery.

3. Conditions of the test: Refer to the control diagrams and Division 25 specifications for points lists.

4. Acceptance Criteria: All functions and communications indicated in the sequence of operation and points lists transmit correctly. For equipment provided with emergency electrical power service, the BMS interfaces and fan equipment automatically restart after power is transferred to an emergency power source without nuisance alarms or the need for operator intervention. When normal power is restored and power is transferred back to the normal power source, the BMS interfaces and fan equipment continue to operate without nuisance alarms or the need for operator intervention.

Interior Lighting Control Devices
Specification Section 26 xx xx

☐ First Test
☐ Repeat Test
☐ Demonstrated Test

☐ PASS
☐ FAIL

Test Date: ______________________________

OBJECTIVES:

A. Verify that the interior lighting controls manual light switch, occupancy sensors, vacancy sensors, daylighting sensors and motion sensor are installed per code and the design document requirements.

EQUIPMENT TO BE TESTED:

Equipment ID	Description
N/A	Manual Light Switch (single switch or 3-way switch)
N/A	Occupancy Sensors (wall or ceiling mounted)
N/A	Vacancy Sensors (wall or ceiling mounted)
N/A	Daylighting sensors (integral or external to the light fixtures)
N/A	Motion Sensors (integral or external to the light fixtures)

FUNCTIONS TO BE TESTED:

A.	Insulation resistance
B.	Phase rotation
C.	Installation verifications per NETA

Notes:

(1)

CONDITIONS OF TEST:

A.	Perform insulation resistance test phase-to-phase and phase-to-ground of each bus section.
Notes: (1)	

ACCEPTABLE RESULTS:

A.	Insulation resistance test voltages and minimum resistances shall be in accordance with Exhibit A, Table 26 08 00 - A3.
B.	Phase rotation shall be compatible with the serving utility.
C.	NETA inspections are all confirmed to be acceptable.

SECTION 26 13 13

MEDIUM-VOLTAGE AC CIRCUIT BREAKER SWITCHGEAR

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes.

1. Requirements for metal-clad, medium-voltage AC circuit breaker switchgear for medium-voltage distribution, excluding prefabricated traction power substation AC switchgear.

1.02 REFERENCES

A. Abbreviations and Acronyms

1. LCC Link Control Center.
2. MVSS Medium Voltage Substation.
3. NC Normally closed.
4. NO Normally open.

B. Institute of Electrical and Electronics Engineers (IEEE):

1. IEEE C37.06 Standard for AC High-Voltage Circuit Breakers Rated on a Symmetrical Current Basis - Preferred Ratings and Related Required Capabilities for Voltages Above 1000 V.
2. IEEE C37.09 Standard Test Procedure for AC High-Voltage Circuit Breakers Rated on a Symmetrical Current Basis.
3. IEEE C37.12 Guide for Specifications of High-Voltage Circuit Breakers (over 1000 Volts).
4. IEEE C37.20.2 Standard for Metal-Clad Switchgear.
5. IEEE C37.46 Standard Specifications for High-Voltage (>1000 V) Expulsion and Current-Limiting Power Class Fuses and Fuse Disconnecting Switches.
6. IEEE C37.90 Standard for Relays and Relay Systems Associated with Electric Power Apparatus.
7. IEEE C57.13 Standard Requirements for Instrument Transformers.

C. National Electrical Contractors Association (NECA):

1. NECA 1Standard for Good Workmanship in Electrical Construction.
2. NECA 430 Standard for Installing Medium-Voltage Metal-Clad Switchgear.

1.03 SUBMITTALS

A. Manufacturer’s descriptions, catalog data and other pertinent information concerning design and application ratings, service performance and reliability and information, necessary for the operation and maintenance of equipment.

B. Manufacturer’s detail drawings for each type of switchgear assembly.

C. Manufacturer’s schematic wiring and interconnection diagrams.

D. Relays, control switches, indicating lamps, protective devices and cubicle heaters. Complete description of protection devices, coordination curves, and setting procedures.

E. AC Switchgear: Complete details of circuit breakers and draw-out mechanism.

F. Ground and test device details including terminals, ports, insulation, barriers, grounding, and octopus.

G. Preliminary and as-built relay setpoint files.

H. Shop Drawings

I. Testing:

1. Test procedures for each test to be performed.

2. Test results for each test a maximum of 10 Days after date test was performed.

J. Maintenance Material Submittals:

a. Spare Parts: Provide one spare breaker of each voltage class.

b. Serial and model number information: Provide serial numbers and model numbers for all circuit breakers CTs and PTs, etc.

K. Tools:

1. Provide one manual circuit-breaker racking handle at each switchgear location.

2. Provide one manual crank at each switchgear location for charging circuit breaker operating mechanism.

3. Provide 27kV and 15 kV ground and test devices in quantities as noted on the drawings. Provide one ground “octopus” for each.

4. Provide one transfer table at each MVSS.

1.04 QUALITY ASSURANCE / QUALITY CONTROL

A. The AC metal clad switchgear shall be UL labeled or certified as conforming to the requirements of UL and IEEE by a third-party testing laboratory recognized by the State of Washington.

B. Switchgear supplier shall have and document a minimum of 10 years’ experience providing comparable switchgear and protective relays to industrial, transit or utility customers.

C. Testing:

1. Factory Tests: Shall be conducted by or under the supervision of the equipment manufacturer.

2. Field Tests: Shall be conducted by a NETA certified technician working for an independent testing company under the supervision of the Contractor. The NETA technician shall have a minimum 5 years' experience testing AC switchgear and AC relays. The testing company shall be a NETA member. Qualifications shall be submitted for approval by the Resident Engineer.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Deliver, store, protect, and handle equipment specified in this Section in accordance with manufacturer's recommendations and NECA 430.

B. Storage of the equipment shall be arranged to prevent condensation on or in all cubicles.

PART 2 - PRODUCTS

2.01 GENERAL

A. AC switchgear shall form a line-up of dead-front, totally enclosed, free-standing switchgear suitable for indoor service.

B. Switchgear shall be metal-clad and conform to the requirements of IEEE C37.20.2, except as otherwise indicated.

C. Switchgear shall be manufactured in accordance with the referenced IEEE standards.

2.02 RATINGS

A. AC switchgear shall have the following ratings:

1. Nominal Voltage: 26.4 or 12.5 kV.
2. Maximum Voltage: 27 kV rms or 15 kV rms.
3. Frequency: 60 Hz.
4. Insulation Level, 60 Hz Withstand: 60 kV.
5. Insulation Level, Impulse Withstand: 95kV or 125 kV.
6. Continuous Current: 600A or 1200 A.
7. Momentary Current Symmetrical: 25 kA rms.
8. Maximum Dimensions: 36 inches wide, 96 inches deep, 95 inches high or as noted on drawings.

2.03 AC SWITCHGEAR STRUCTURE

A. Construction:

1. Rigid, self-supporting and self-contained.
2. Structural elements electrically welded or bolted together.
3. No. 11 gauge minimum steel.
4. Shall support equipment under normal loads, short-circuit conditions, and specified seismic conditions.

5. AC switchgear enclosure shall be divided, barriered, and partitioned into separate vertical sections.

6. Paint switchgear enclosures in accordance with Section 34 21 27, Metal Fabrication and Finishes.

B. Mimic Bus:

1. Provide mimic bus across the entire front-face of the switchgear.

2. Mimic bus shall be factory-applied, plastic, 3/8-inch wide and a minimum of 1/32- inch thick. Adhesive tape mimic bus is not acceptable.

3. Indicate with symbols all circuit breakers, switches, potential transformers and incoming and outgoing feeders.

4. Color: Red.

C. Circuit Breaker Compartments.

1. Suitable for accommodation of draw-out circuit breakers.

2. Provide supporting rails for the circuit breakers that allow the circuit breakers to be easily drawn in or out of their housing:

a. Circuit breakers shall draw out from the lower compartment directly onto the floor. Circuit breakers in upper compartments are not allowed.

b. Provide guide rails or cradles for positioning the removable elements as an integral part of the equipment. Guides shall ensure proper alignment.

3. Provide self-aligning, self-coupling, primary and secondary disconnecting devices that allow the draw out breakers to connect or disconnect from the buses and auxiliary circuits:

a. Provide automatic protective shutters to cover live high-voltage terminals and prevent accidental contact with live parts as the removable element of breaker is drawn out of the cubicle.

b. Connection of control wiring to the AC breaker shall be by sliding contacts. A plug-style disconnect is acceptable, provided the breaker cannot be mechanically racked into the connected position with the plug disconnected.

4. Provide a manual racking mechanism for horizontal draw-out of each circuit breaker:

a. Mechanism shall have three circuit breaker positions: Disconnected, test, and connected.

b. Provide positive stops to prevent over-travel at each position.

c. Mechanism shall be designed for racking of circuit breaker in and out of connected and disconnected position with the compartment front door in the closed and latched position.

d. When the breaker is in the connected and test positions, the case and frame shall be grounded by means of a positive contact with a copper ground bus.

5. Provide remote-racking system including linkages, motor mechanism, and control station with umbilical cord. Racking shall be possible by a worker located at least

ten feet to either side of the affected circuit breaker compartment. Provide one remote-racking system for each MVSS.

6. Provide the following interlocks:

   a. Prevent either electrical or manual operation of the breaker unless it is in the Connected or Test position.

   b. A positive mechanical interlock shall prevent racking in or out unless the breaker is in the Open position.

   c. Circuit breaker, complete with the operating mechanism shall be capable of being removed from the enclosure only in the Disconnected position.

D. Control/Terminal Board Compartment.

1. Controls, including programmable controllers, instrumentation, control relays, terminal boards, control wiring and control devices shall be housed in a separate control/terminal board compartment.

2. Compartment shall be barriered from the power wiring and bus work compartments.

   a. Exception. Where controls and terminal boards are dedicated to circuit breaker function, they may be located in the circuit breaker compartment.

3. Protective relays, meters, instruments and control devices shall be mounted on front compartment doors.

E. Access Doors:

1. Access to all components shall be from the front and the rear. When doors are opened to 120-degree stop position, it shall be possible to open adjacent cubicle doors.

2. Equipment access panels located on the side or top of the enclosures are prohibited.

3. Provide each compartment with separate hinged front and rear access doors for servicing.

4. Opening of any front door shall not expose circuits in adjacent compartments.

5. Construction:

   a. No. 11 gauge minimum sheet metal.

   b. Properly reinforce against distortions using suitable flanges and stiffening members.

6. Hinges: Stainless steel heavy-duty type.

7. Latches:

   a. Doors shall be securely fastened in the closed position with a three-point latch easily opened without the use of tools.

8. Two latches will be allowed if front panel consists of more than one full- length door.

9. Handles: Provide each door with a heavy duty-handle.

10. Door Stops: Provide each door with a heavy-duty stop to hold it securely in the open position.

F. Heaters.

1. Provide heating strips in each cubicle. Operating voltage for heating strips shall not exceed 50 percent of heater rated voltage.

2. Provide an individual thermostat to control heater in each cubicle. Locate in a general area such that cool air in the lower portion of the cubicle can be sensed by the thermostat.

G. Lights: Provide linear LED lighting strips, mounted vertically in the left and right front corners of the control/terminal board compartment of each cubicle and directed at the control/terminal panel. Lighting strips to be 18 inches minimum in length and provide accurate rendering of wire colors.

H. Warning Signs:

1. Front Access Doors: Sign on each stating "DANGER: LIVE PARTS" and "DANGER: HIGH VOLTAGE."

2. Rear Access Doors.

a. Sign on each stating "DANGER: LIVE PARTS" and "DANGER: HIGH VOLTAGE."

b. Sign on each removable plastic panel inside access door stating, “DANGER: HIGH VOLTAGE.”

2.04 MEDIUM-VOLTAGE CIRCUIT BREAKER

A. General.

1. Circuit breaker shall be a draw-out type and utilize vacuum interrupters having load and fault break capabilities and shall conform to or exceed the requirements of IEEE C37.06 and IEEE C37.12.

2. Circuit breakers shall be identical and physically and electrically interchangeable.

3. Circuit breaker frame shall be provided with a full front metal shield to prevent access to any live primary bus or load terminals when the circuit breaker is in the connected position.

4. Provide a truck or fifth wheel at each switchgear location to facilitate one-person breaker removal and turning.

5. Provide means for padlocking the AC breaker in the open position.

6. Circuit Breaker Insulation.

a. Noncombustible, non-hygroscopic and track-resistant.

b. Mechanical strength and physical characteristics shall match the stresses imposed by the circuit breaker rated momentary current.

B. Minimum Ratings:

1. Nominal System Voltage: 26.4Y/15.2 kV or 12.5Y/7.2 kV three-phase, solidly grounded.

1. Maximum Voltage: 27 kV rms or 15 kV rms.

2. Frequency: 60 Hz.

3. Insulation Level, 60 Hz: 36 kV, rms.

4. Insulation Level, Impulse: 125 kV, crest.

5. Short Circuit Current at Maximum Voltage: 25 kA rms.

6. Continuous Current: 1200 A.

7. Closing and Latching Capability: 62 kA rms.

8. Fault Clearing Time: 5 cycles max.

C. Circuit Breaker Operating Mechanism.

1. Motor-charged and spring-operated unless otherwise approved by Resident Engineer.

2. Mechanism shall be designed to prevent overcharging.

3. The mechanism shall ensure that the release of stored energy for closing the circuit breaker main contacts is prevented unless the mechanism has been fully charged.

4. The stored-energy closing mechanism shall automatically charge itself within 15 seconds after closing of the breaker.

5. Energy storage shall be sufficient for an open-close-open cycle at maximum rated short circuit current.

6. A manual cranking feature shall be included on the operating mechanism to permit spring charging in the event motor power is unavailable. Provide an interlock to prevent withdrawal of the circuit breaker from the enclosure when the mechanism is in the fully charged state:

a. Automatic controlled discharge of the stored energy when the circuit breaker is withdrawn from or inserted into the enclosure will also be acceptable.

7. Circuit breaker shall be electrically and mechanically trip free. The operating mechanism shall be non-pumping.

8. Provide a four-digit, non-resettable, register-type mechanical operations counter on each circuit breaker to record each close/open cycle.

D. Circuit Breaker Control:

1. Control Voltage: 125 Vdc.

2. Closing Mechanism: Provide with a spring release coil, anti-pump relay and spring charging motor suitable for operation over a voltage range from 85 percent to 115 percent of the nominal dc control voltage.

3. Tripping Mechanism: Provide with a shunt trip coil suitable for operation over a voltage range from 75 percent to 125 percent of the nominal dc control voltage.

4. Control Switches:

a. Open/Close: Switchboard type heavy-duty pistol-grip control. Control switch shall permit open and close operations when the circuit breaker is in the connected or test position.

b. Provide a switch for resetting the circuit breaker after a trip and provide a mechanical trip indication at the control switch.

c. Local/Remote (Device 43): Switch mounted on the front of the cubicle. Provide positive stops in both positions.

5. Auxiliary Contacts: Provide a minimum of six electrically separate sets of reversible auxiliary contacts, in addition to those required for the circuit breaker control circuit.

a. Auxiliary contacts shall be operated by the breaker mechanism in both the Connected and Test positions.

b. Spare auxiliary contacts shall be wired to the outgoing terminal blocks.

E. Trip Circuit Monitor:

1. Provide a trip circuit monitor for monitoring the trip coil on each AC circuit breaker and lockout relay.

2. Monitor shall have NO and NC Form C contacts for indication of a failed trip coil.

3. Monitor shall have a 200-millisecond delay to allow for auxiliary contacts to transfer.

4. Control Power: 125 Vdc.

5. Trip coil status shall be monitored by SCADA.

6. Manufacturer: E-max RAW-1D or approved equal as approved by Resident Engineer.

F. Indicating Lights.

1. Provide indicating lights on the front of the circuit breaker enclosure to indicate the state of the circuit breaker:

a. Closed Breaker: Red light.

b. Tripped or Open Breaker: Green light.

2. Provide an amber LED above each local/remote switch that illuminates to indicate switch is in local position.

3. Provide a white LED indicating light on the front of the circuit breaker enclosure to indicate the stored-energy closing mechanism is charged.

4. Trip Circuit Monitor:

a. Provide a green LED that illuminates when the trip coil is energized and turns off when the coil is de-energized.

b. Provide a red LED that illuminates upon failure of the trip coil.

5. LEDs:

a. Plug-in replaceable with a life of 100,000 hours.

b. Protected against reverse polarity by a diode.

G. Lock Out Relay (Device 86): When the main AC circuit breaker is tripped by the lockout relay, the AC breaker shall be locked out until manually reset.

2.05 BUSES AND CONNECTIONS

A. Main horizontal three-phase bus shall be fabricated from silver-plated, electrical grade copper and extend the full length of the switchgear.

B. Bus, including joints, shall be insulated the full length with flame-retardant, non- hygroscopic, track-resistant insulation over its entire length rated 30 kV. The method of bus insulation and the insulating material shall conform to ANSI C37.20.

C. Verify and record that all current-carrying bolts and fasteners are properly torqued with a calibrated torque wrench.

D. All connections, including bus taps, circuit breaker connections, connections to CTs and PTs and transformers, shall be bussed using the same material as the main horizontal bus with silver plated copper and joined with a minimum of two bolts and Belleville washers per joint. After final torquing all bolted connections shall be torque striped. Cable connections are not permitted.

E. Hardware shall be silicon bronze.

F. Continuous current rating of all main bus and circuit breaker connections shall be at least 1200 A.

G. Buses and bus connections shall be adequate to withstand thermal and mechanical stresses associated with short-circuit currents equal to the momentary and 2-second rating of the circuit breaker.

H. A copper ground bus, not less than 2 inch by 1/4 inch, shall extend the length of the AC switchgear assembly and be bonded to each switchgear section by solidly bolting the bus to a non-removable structural member. After final torquing all bolted connections shall be torque striped.

2.06 UTILITY INCOMING SECTION

A. Provide supplementary equipment as required to connect switchgear relays and power meter to Sound Transit SCADA system.

B. Provide utility metering sections as noted on Contract Drawings for substations meeting EUSERC requirements and complying with Utility standards.

C. Surge arrestors shall comply with IEEE C62.11, distribution class, metal oxide varistor type, connected to each phase of incoming circuit and ahead of disconnecting device. Rated voltage to be line-to-line of line-to-neutral.

2.07 PROTECTIVE RELAYS

A. Protective relays shall be of the microprocessor-based IED (Intelligent Electronic Devices) type capable of interconnecting with programmable control (PLC) supervisory devices and shall be flush mounted, with wiring connections on the back of the relay.

B. Protective relays shall be provided with integral test switches.

C. Protective relays shall have rustproof metal or high-impact plastic rectangular cases.

D. Contacts shall be silver-plated and non-welding. Provide relays conforming to the applicable sections of IEEE C37.90.

E. Devices including switches, relays, indicating lights and test plugs shall be arranged to be conveniently accessible and easily visible. The grouping shall be modular and place related functions in proximity.

F. Devices shall be mounted plumb and square with the lines of the panels and as recommended by the manufacturer. Relays or devices shall be mounted on hinged or removable panels and shall not be mounted on a fixed portion of the switchgear.

G. Design metering compartment to avoid wiring congestion. Auxiliary devices shall match the general appearance as far as possible with frames of a compatible color.

H. Devices of the same general type shall be manufactured by the same company and shall be similarly arranged and mounted.

I. At a minimum, the following protective and monitoring devices shall be provided as shown on the one-line drawings. Additional protective devices recommended by Contractor or equipment manufacturers may be installed with Resident Engineer approval:

1. Phase Fault Overcurrent Relays:

a. The primary function of the phase overcurrent relays (Device 50/51) shall be to provide overload and fault protection for loads served.

b. Relays shall be designed to compile a composite time overcurrent characteristic curve which shall best match the normal and overload requirements of the load and to match the thermal and mechanical withstand of transformers.

c. Each relay, (Device 50/51) shall provide for both instantaneous and time delay overcurrent protection.

2. Ground Fault Overcurrent Relay:

a. A residual instantaneous and time delay relay (Device 50N/51N) shall be provided and connected in such a way as to provide sensitive ground fault detection.

b. This relay shall be field adjustable.

3. Loss of Phase/Phase Sequence:

a. The three-phase voltage protective relay (Device 47) shall be provided and connected in such a way as to provide open-phase protection.

b. This relay shall contain a field adjustable time delay.

4. Undervoltage:

a. The primary function of the undervoltage relay (Device 27) shall be to trip and annunciate an AC input voltage of less than 80 percent of the nominal voltage.

b. This relay shall also trip and annunciate a loss of voltage due to utility outage. The relay shall be provided with a 0.5 to 4 second adjustable time delay before tripping.

5. Reverse Power:

a. Provide reverse power (Device 32) protective relaying function in incoming feeder cubicles connecting to utility service switchgear. This device shall trip and lock-out associated circuit breaker when it detects a flow of power from Sound Transit back toward the utility.

6. Lockout:

a. Lockout relay (Device 86) shall be provided on the AC circuit breaker compartment. A pistol-grip switch shall be provided for resetting of the lockout relay.

b. Provide indication of "lockout" and "normal" at the reset switch.

2.08 INSTRUMENTS AND METERS

A. The accuracy of all indicating instruments shall be within 1 percent of full-scale reading.

B. Voltmeters and ammeters shall be suitably rated for use with the corresponding transformer.

C. Scales shall be of a suitable range, equal to the associated potential or current transformer primary rating.

D. Provide incoming-line phase-selector switches for connection to the line transformers for the ammeter and voltmeter.

E. Provide power meter in accordance with Electrical Power Monitoring section.

2.09 INSTRUMENT TRANSFORMERS

A. Instrument transformers shall conform to IEEE C57.13, with the additional requirements indicated below.

B. Current Transformers:

1. Shall be capable of withstanding thermal and mechanical ratings of the circuit breaker.

2. Molded-rubber or epoxy construction, wound-type or bushing-mounted.

3. Wound-Type Current Transformers.

a. Provide separate compartment isolated from the control panel and all other equipment.

b. Provide a mounting frame which bolts securely to the switchgear frame.

c. Transformers shall have full-wave impulse insulation level of 125kV.

d. Secondary terminal blocks shall have covers with integral shorting bars and secondary wiring shall be run to readily identifiable terminal block points in the control compartment.

e. Terminal block points shall also have integral shorting bars for the current transformer leads.

4. Bushing-Type Current Transformers:

a. Low-voltage, ring-core, high-accuracy type designed for secure mounting on the primary contact support bushings.

5. Accuracy:

a. Protective Relaying: Current transformers shall satisfy the requirements for relaying accuracy classification, under the burdens imposed by the devices as specified.

b. Power Meters:

1) Current transformers shall be metering class 0.15 at burden B0.2.

2) If this metering accuracy is not available, perform an analysis of expected accuracy of metering equipment for loads from 1 percent to 100 percent of actual load rating and submit for approval.

3) Bushing current transformers that will not provide accuracy of plus or minus 0.3 percent at 10 percent load and plus or minus 0.5 percent at full load will be rejected and require installation of wound-type current transformers.

C. Potential Transformers:

1. Drawout-type, molded-rubber or epoxy construction.

2. Transformers shall have full-wave impulse insulation level of 150 kV.

3. Primary and secondary circuits of all potential transformers shall be fused by means of non-renewable cartridge-type fuses meeting requirements of IEEE C37.46.

4. Grounding: The potential transformer shall be visibly grounded when the primary circuit is disconnected and in position for inspection.

5. Fuses:

a. All primary fuses shall be completely disconnected before access can be obtained to either the transformer or its high-voltage fuses.

b. Secondary circuit fuses shall be installed in the low-voltage circuits and shall be located to permit replacement when the switchgear is in operation.

6. Rating: All potential transformers shall be adequately rated in accordance with the burden requirements of the accuracy classification and capable of carrying rated load continuously without excessive heating or damage.

7. Accuracy: Potential transformers for power meters shall have accuracy class 0.3 at W, X, M, and Y burden.

2.10 SCADA

A. Devices furnished under this Contract shall be provided with additional terminations within their respective control enclosures for connection to the Sound Transit supervisory control system. Refer to Contract Drawings for typical SCADA points for each type of circuit breaker.

2.11 GROUND AND TEST DEVICE

A. Ground and test device shall be readily adaptable to line or load terminals, which can be connected onto individual phases with ground connector for external connection to station ground. Provide standard “ball” type connectors for positive connection to studs on ground and test device terminals.

B. Device shall be capable of being racked into cubicle with circuit breaker racking handle.

C. Line and load terminals and phases shall be separated by barriers.

D. Provide ports on front of ground and test devices for insertion of standard "Biddle" high voltage tester and grounding "octopus".

E. Provide visual means of viewing line and load terminals.

F. Device shall be continuously grounded as it is inserted into cubicle.

G. Ground Octopus:

1. Three-phase.

2. Connectors: Three ball/socket-type, compatible with grounding studs on ground and test device and one C-clamp type for connection to ground bus.

3. Readily connected with a hot stick.

4. Length: Sufficient to allow connection to the closest ground bus when ground and test device is fully inserted into each AC breaker cubicle.

2.12 TRANSFER TABLE

A. Provide transfer tables for removing and lowering PTs and draw-out fuse trunions.

B. Table shall be capable of being raised and lowered hydraulically from floor to trunion levels.

2.13 SOURCE QUALITY CONTROL

A. Factory Design Tests:

1. Tests shall consist of all design tests as specified in IEEE C37.20.2.

2. Perform tests on the AC switchgear assembly and each component of the AC switchgear.

3. The main AC circuit breaker test shall be performed in accordance with the design tests as described in IEEE C37.09.

B. Factory Production Tests:

1. Perform on AC switchgear in accordance with IEEE C37.20.2:

a. Dielectric tests.

b. Mechanical operation tests.

c. Electrical operation and control wiring tests, except that the control wiring continuity shall be verified by actual electrical operation of control devices.

d. Grounding of instrument transformer cases.

2. Perform on each AC circuit breaker in accordance with IEEE C37.09 prior to mounting inside AC switchgear:

a. Nameplate check.

b. Control and secondary wiring checks.

c. Clearance and mechanical adjustment check tests.

d. Mechanical operation tests.

e. Timing tests.

f. Stored energy system tests.

g. Conductivity of the current path test.

h. Low-frequency withstand voltage tests on major insulation components.

i. Current transformer.

j. Resistors and coils.

3. Meters, Instruments and Instrument Transformers:

a. Check for accuracy, performance and operation in accordance with IEEE C57.13.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Switchgear shall be installed in accordance with manufacturer's installation instructions, NECA 1, and NECA 430.

3.02 PROTECTIVE DEVICE COORDINATION

A. Perform a Coordination Study for the AC system to ensure that the protective devices will function together, in conformance with System Studies section.

B. Coordination study shall be approved by Sound Transit prior to field configuration of protective devices.

3.03 SURGE ARRESTER GROUNDING

A. The surge arrester ground terminals shall be connected directly to the switchgear ground bus connected to the station grounding electrode. Surge arresters in Service Switchgear are furnished by Utility.

3.04 FIELD QUALITY CONTROL

A. AC Switchgear:

1. The following tests shall be performed after installation of the AC switchgear:

a. Continuity and insulation resistance tests phase-to-ground and phase-to-phase, for all buses with a 2500 Vdc megohmmeter for one minute.

b. High potential test to ground and between phases on medium-voltage buses with circuit breakers racked-in and closed.

2. Verification of proper operation of each interlock and protective device.

a. Test of each AC protection relay using a three-phase current/voltage injection test device. Test device shall have the following functions:

1) Current/voltage magnitude.

2) Frequency and angle are adjustable per phase.

3) Internal digital timer is programmable to start and stop.

b. Each recommended AC relay protection setting shall be verified and tested.

END OF SECTION

SECTION 26 33 53

UNINTERRUPTIBLE POWER SUPPLY AND LIGHTING INVERTER

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for solid state double conversion type uninterruptible power supply system complete with battery bank, battery circuit breaker, internal bypass/isolation switch and external maintenance bypass circuit breaker panel. The transfer from normal power to battery power shall utilize a true no break, sine wave output system to maintain a zero transfer time. The system shall be capable of powering any combination of electronic ballast, power factor corrected ballast, and self-ballasted fluorescent, incandescent or HID lighting, building management systems, and any other critical voltage or frequency-sensitive electronic loads. The system shall operate from 0-100 percent loading and be rated to deliver its full kW rating at unity power factor.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. American National Standards Institute (ANSI):

   a. ANSI C62.41 (IEEE 587): Recommended practice on Surge Voltages in Low-Voltage AC Power Circuits.

2. National Electrical Manufacturers Association (NEMA):

   a. NEMA PE-1: Uninterruptible Power Systems.

   b. NEMA 250: Enclosure for Electrical Equipment.

3. Underwriters Laboratories Inc. (UL):

   a. UL 1778: Uninterruptible Power Supply Equipment.

   b. UL 924A: Standard for Emergency Lighting and Power Equipment.

4. National Fire Protection Association (NFPA):

   a. NFPA 70 (National Fire Protection Association) – National Electrical Code.

   b. NFPA 75: Electronic Computer / Data Processing Equipment.

5. Institute of Electrical and Electronic Engineers (IEEE):

   a. IEEE 1184: Guide for Selection and Sizing of Batteries for Uninterruptible Power System.

b. IEEE 587: Recommended practices on surge voltages in low voltage power circuits.

6. NETA ATS: International Electrical Testing Association, Electrical Testing Specifications.

7. Federal Communications Commission (FCC):

a. FCC Part 15 Class A.

8. National Institute of Standards and Technology (NIST)

B. Definitions:

1. EMI: Electromagnetic interference.

2. LCD: Liquid-crystal display.

3. LED: Light-emitting diode.

4. THD: Total harmonic distortion.

5. UPS: Uninterruptible power supply.

1.03 SUBMITTALS

A. Provide preliminary, final, and as-built submittals for subsystems and products specified in this section. Include plans, elevations, sections and attachment details.

B. Product Data: Include data on features, ratings, and performance for each uninterruptible power supply component indicated.

C. Shop Drawings: Detail assemblies of equipment indicating dimensions, weights, components, and location and identification of each field connection. Show access, workspace, and clearance requirements; details of control panels; battery arrangement and mounting details.

D. Wiring Diagram: Detail internal and interconnecting wiring, power, signal, and control wiring. Differentiate between field-installed and factory-installed wiring and components.

E. Dimensioned Outline Drawings of Equipment Unit: Identify weight and center of gravity and locate and describe mounting and anchorage provisions for each individual cabinet or enclosure.

F. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

G. Manufacturer Certificates: Signed by manufacturers certifying that they comply with requirements.

H. Qualification Data: For firms and persons specified in “Quality Assurance” Article.

I. Factory Test Reports: Comply with specified requirements. Submit factory test reports within 10 days of test completion.

J. Field Test Reports: Indicate test results compared with specified performance requirements, and provide justification and resolution of differences if values do not agree. Submit test reports within 10 days of test completion.

K. Maintenance Data:

1. List of spare parts and replacement components recommended being stored at project site for ready access.

2. Detailed operating instructions covering operation under both normal and abnormal conditions.

3. Warranties: Special warranties specified in this Section.

L. Manufacturer Seismic Qualification Certification: Submit certification that UPS equipment will withstand seismic forces in accordance with Uniform Building Code (UBC) for Washington State seismic zone three requirements.

M. Extra Materials

1. Local field service organization shall stock extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

2. Provide toll free direct phone number.

3. Fuses: One for every ten of each type and rating, but not less than one of each.

4. Cabinet Ventilation Filters: One complete set.

5. One spare circuit board for each critical circuit.

1.04 QUALITY ASSURANCE

A. Qualifications

1. UPS manufacturer shall have a minimum of twenty years' experience in the design, manufacture and testing of solid-state UPS systems. A list of installed UPS systems of the same type as the manufacturer proposes to furnish for this application shall be supplied upon request.

2. The UPS manufacturer shall maintain a staffed 7x24x365 call center for technical and emergency support.

3. Field Engineering Support: The UPS manufacturer shall directly employ a nationwide field service department staffed by factory-trained field service engineers dedicated to startup, maintenance, and repair of UPS equipment. The organization shall consist of local offices managed from a central location. Field engineers shall be deployed in key population areas to provide on-site emergency response within 24 hours. A map of the United States showing the location of all field service offices must be submitted with the proposal. Third-party maintenance will not be accepted.

4. Spare Parts Support: Parts supplies shall be located in the field to provide 80 percent of all emergency needs. The factory shall serve as the central stocking facility where a dedicated supply of all parts shall be available within 24 hours.

5. Product Enhancement Program: The UPS manufacturer shall make available feature upgrade service offerings to all users as they are developed. These upgrades shall be available as optional field-installable kits.

6. Maintenance Contracts: A complete range of preventative and corrective maintenance contracts shall be provided and offered with the proposal. Under these contracts, the manufacturer shall maintain the user's equipment to the latest factory revisions.

7. Source Limitations: Obtain the UPS and associated components specified in this Section from a single manufacturer with responsibility for entire UPS installation.

B. The UPS manufacturer shall have ISO 9001 certification for engineering/R&D, manufacturing facilities and service organization.

C. Listing and Labeling: Provide electrical components, devices, and accessories that are Listed and Labeled as defined in NFPA 70, Article 100, by an Independent Testing Laboratory acceptable to the City Electrical Inspector, and marked for intended use for the location and environment in which they are installed. The equipment shall also be labeled "Suitable for use on emergency system" in accordance with NEC 700-3.

1.05 DELIVERY, STORAGE AND HANDLING

A. Deliver equipment in fully enclosed vehicles after specified environmental conditions have been permanently established in spaces where equipment is to be placed.

B. Store equipment in spaces with environments controlled within manufacturer's ambient temperature and humidity tolerances for non-operating equipment.

1.06 ENVIRONMENTAL

A. The UPS shall withstand any combination of the following external environmental conditions without operational degradation.

1. Operating Temperature:

a. UPS Module 0 degrees C to + 40 degrees C (32 degrees F to 104 degrees F) without de-rating.

b. Battery 77 degrees F ± 9 degrees F (25 degrees C ± 5 degrees C)

2. Storage Temperature:

a. UPS Module - 25 degrees C to + 40 degrees C (-13 degrees F to 104 degrees F). Battery -4 degrees F to 92 degrees F (-20 degrees C to 33 degrees C).

3. Relative Humidity (operating and storage): 95 percent maximum non-condensing.

4. Elevation:

a. Operational: 3300 ft (1000 m) maximum without de-rating.

5. Storage/Transportation:

a. Up to 40,000 feet (12,200m) above mean sea level.

1.07 WARRANTY

A. Warranties, General: Special warranties specified in this Article shall be in addition to, and run concurrent with, other warranties made under requirements of these Contract Specifications.

B. Special Battery Warranties: Written warranty, signed by manufacturer and Installer agreeing to replace UPS system storage batteries that fail in materials or workmanship within specified warranty period.

C. Warranted Cycle Life for Sealed Lead-Acid Batteries: Equal to or greater than that represented in manufacturer's published table based on annual average battery temperature of 77 degrees F.

D. Special UPS Warranties: Written warranties, signed by manufacturer and Installer agreeing to replace components that fail in materials or workmanship within special warranty period.

E. Special Warranty Period: two years:

1. One-year limited factory warranty shall include replacement coverage for the UPS parts for a period of 18 months from shipment or 12 months from start-up, whichever occurs sooner.

~~2.~~ One-year service protection package shall include 7x24 on-site repair/replacement labor for UPS parts and batteries; 7x24 technical support coverage; and 7x24 remote monitoring service (with monthly reports for UPS and battery performance). Standard response time shall be 8 hours from receipt of call. Manufacturer shall also offer, as an option, 7x24 on-site service support with guaranteed response times of 2 hours in certain major metropolitan areas.

3. Manufacturer shall also include Start-up services consisting of: 5x8 Start-up service of UPS and batteries, with option for 7x24 Start-up. On-site user training, Site Audit, installation and commissioning of monitoring service, and validation of one-year limited factory warranty will be performed during the start-up.

4. Manufacturer shall also offer an optional service plan to provide 7x24 on-site coverage (preventive and corrective) for UPS and batteries, guaranteed response time, remote monitoring, Web access to service site history, annual Site Audit, UPS and battery preventive maintenance visit, and discounts on upgrade and modification kits. Manufacturer shall also provide an optional battery service plan to provide parts-and-labor coverage for partial and full battery strings, either with preventive maintenance or replacement coverage.

PART 2 - PRODUCTS

2.01 UPS SYSTEM DESCRIPTION

A. Safety:

1. The UPS shall be certified by Underwriters Laboratories in accordance with UL 1778.

2. The UPS shall be certified by Underwriters Laboratories in accordance with UL 924.

B. UPS System Components: The UPS system shall consist of the following main components:

1. UPS module containing a Rectifier, Inverter, Battery Charger, Static Bypass, and associated Control and Monitor Panel.

2. Battery strings in Line-and-Match Battery Cabinets.

3. Line-and-Match accessory cabinets for transformer, maintenance bypass, parallel tie, and distribution applications.

4. External maintenance bypass circuit breaker panel.

C. UPS Module Modes of Operation: The UPS Module shall operate as an on-line double conversion, fully automatic system in the following modes:

1. Normal: Utilizing commercial AC power, the critical load shall be continuously supplied by the Inverter. The Inverter shall power the load while regulating both voltage and frequency. The Rectifier shall derive power from the commercial AC source and shall supply DC power to the Inverter. Simultaneously, the Battery Charger shall charge the battery.

2. Battery: Upon failure of the commercial AC power, the critical load shall continue to be supplied by the Inverter, which shall obtain power from the batteries without any operator intervention. There shall be no interruption to the critical load upon failure or restoration of the commercial AC source.

3. Recharge: Upon restoration of the AC source, the Charger shall recharge the batteries and simultaneously the Rectifier shall provide power to the Inverter. This shall be an automatic function and shall cause no interruption to the critical load.

4. Bypass: If the UPS module must be taken out of the Normal mode for overload, load fault, or internal failures, the static bypass switch shall automatically transfer the critical load to the commercial AC power. Return from Bypass mode to Normal mode of operation shall be automatic. No-break transfer to and from Bypass mode shall be capable of being initiated manually from the front panel.

2.02 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Eaton Corporation.

2. SolidState controls Inc.

3. Liebert Corp.

4. Controlled Power Company.

5. Approved Equal as approved by Resident Engineer.

B. Manufacturers (Lighting Inverters):

1. Emergi-Lite Emergi-Power Systems.

2. Barron Exitronix.

3. Dual-Lite LSN Series Unverter Systems.

4. Myers Illuminator.

5. Perfect Power Systems.

6. Chloride Systems, Leibert EXM.

2.03 MANUFACTURED UNITS

A. Output Load Capacity: 1) Three Phase, 0.8 lagging power factor. 2) Single Phase, 0.8 lagging power factor.

B. UPS shall perform as specified in this Article while supplying rated full-load current, composed of any combination of linear and nonlinear load, up to 100 percent nonlinear load with a load crest factor of 3.0, under the following conditions or combinations of the following conditions:

1. Inverter is switched to battery source.

2. Steady-state ac input voltage deviates up to plus or minus 10 percent from nominal voltage.

3. Steady-state input frequency deviates up to plus or minus 5 percent from nominal frequency.

4. Linear load harmonic distortion capability: Output voltage THD of less than 2 percent for 100 percent linear load.

5. Non-linear load harmonic distortion capability: Output voltage THD of less than 5 percent for 100 percent non-linear load when tested using the non-linear load described in IEC 62040-3 connected line to neutral.

6. Output Frequency: 60 Hz plus/minus 0.5 percent over full range of input voltage, load and battery voltage.

7. Load is 50 percent unbalanced continuously.

C. Minimum Duration of Supply: If battery is sole energy source supplying UPS-rated full-output load current at 80 percent power factor, duration of supply is 90 minutes.

D. Input Voltage Tolerance: System steady state and transient output performance remains within specified tolerances when steady-state ac input voltage varies plus 10, minus 20 percent from nominal voltage.

E. Maximum Acoustical Noise: 65 dBA measured one meter from the surface of the UPS.

F. Maximum Energizing Inrush Current: Six times the full-load current.

G. Maximum AC Output-Voltage Regulation for Loads up to 50 percent Unbalanced: Plus or minus 2 percent over the full range of battery voltage.

H. Output Frequency: 60 Hz, plus or minus 0.5 percent over the full range of input voltage, load, and battery voltage.

I. Maximum Harmonic Content of Output-Voltage Waveform: Five percent RMS total and three percent RMS for any single harmonic, for 100 percent rated nonlinear load current with a load crest factor of 3.0.

J. Minimum Overload Capacity of UPS at Rated Voltage: 125 percent of full-load rating for 10 minutes without bypass source, and 150 percent for 30 seconds without bypass source.

K. Input Power Factor: A minimum of 0.90 lagging when supply voltage and current are at nominal rated values and UPS is supplying rated full-load current.

L. EMI Emissions: Comply with FCC Rules and Regulations, 47 CFR 15 for Class A.

M. Electronic Equipment: Solid-state devices using hermetically sealed, semiconductor elements. Devices include rectifier-charger, inverter, static bypass transfer switch, and system controls.

N. Enclosure: Comply with NEMA 250, Type 3R, unless otherwise indicated:

1. The cabinet doors and louvers shall require tools for access.

2. Provide casters and leveling feet.

3. Front access only for servicing.

4. The overall enclosure width and depth shall not exceed the space allocated on the Contract Drawings.

O. Control Assemblies: Mount on modular plug-ins, readily accessible for maintenance.

P. Surge Suppression: Protect internal UPS components from surges that enter at each AC power input connection including main disconnect, static bypass transfer switch, and maintenance bypass/isolation switch. Protect rectifier-charger, inverter, controls, and output components:

1. Use factory-installed surge suppressors tested according to IEEE C62.41, Category B.

2. Additional Surge Protection: Protect internal UPS components from low frequency, high-energy voltage surges described in IEEE C62.41. Design the circuits connecting with external power sources and select circuit elements, conductors, conventional surge suppressors, and rectifier components and controls so input assemblies will have adequate mechanical strength and thermal and current-carrying capacity to withstand stresses imposed by 40-Hz, 180 percent voltage surges described in IEEE C62.41.

Q. Capacity Upgrade Capability: Arrange wiring, controls, and modular component plug-in provisions to permit future 25 percent increase in UPS capacity.

R. Seismic-Restraint Design: UPS assemblies, subassemblies, and components; and fastenings and supports, mounting, and anchorage devices for them, shall be designed and fabricated to withstand static and seismic zone three forces in all directions.

S. UPS Cabinet Ventilation: Cooling of the UPS shall be by forced air. Low-velocity fans shall be used to minimize audible noise output. Fan power shall be provided by the UPS output. Cabinet ventilation shall be incompliance with the Seattle Mechanical Code Section 502.5.

T. Output Circuit Neutral Bus, Conductor, and Terminal Ampacity: Rated phase current times a multiple of 2.0, minimum.

U. Capacity Upgrade Capability:

1. Selected systems shall be able to accept a field installed power upgrade to the next higher power rating without an increase in cabinet size.

2.04 COMPONENTS

A. Rectifier-Charger:

1. Capacity: Adequate to supply the inverter during full-rated output load conditions and simultaneously recharge the battery from fully discharged condition to 95 percent of full charge within 10 times the rated discharge time for duration of supply under battery power at full load.

2. Output Ripple: Limited by output filtration to less than 0.5 percent of rated current, peak to peak.

3. Rectifier-Charger Control Circuits: Immune to frequency variations within rated frequency ranges of normal and emergency power sources.

a. Response Time: Field adjustable for maximum compatibility with portable generator-set power source.

4. Battery Float-Charging Conditions: Comply with battery manufacturer written instructions for battery terminal voltage and charging current required for maximum battery life.

B. Inverter (Component of UPS):

1. Description: Pulse-width modulated, with sinusoidal output.

2. Description: Pulse-width modulated, with sinusoidal output. Include a bypass phase synchronization window adjustment to optimize compatibility with portable engine-generator-set power source.

C. Static Bypass Transfer Switch:

1. Description: Solid-state switching device providing uninterrupted transfer. A contactor or electrically operated circuit breaker automatically provides electrical isolation for the switch.

2. Switch Rating: Continuous duty at the rated full-load current of the UPS, minimum.

D. Battery:

1. Description: Sealed, valve-regulated, recombinant, lead-calcium units, factory assembled in an isolated compartment of UPS cabinet, and complete with battery disconnect switch.

E. Maintenance Bypass/Isolation:

1. Description: Manually operated arrangement of switching devices with mechanically actuated contact mechanism arranged to route the flow of power to the load around the rectifier-charger, inverter, and static bypass transfer switch:

   a. Switch shall be interlocked to prevent interrupting power to the load when switching to the bypass mode.

   b. Switch shall isolate other UPS components electrically to permit safe servicing.

2. Comply with NEMA PB 2 “Dead-Front Distribution Switchboards” and UL 891 “Dead-Front Switchboards.”

3. Switch Rating: Continuous duty at rated full-load current of UPS.

4. Mounting Provision: External wall mount.

5. Key interlock requires unlocking maintenance bypass/isolation switch before switching from normal position with key that is released only when the UPS is bypassed by the static bypass transfer switch. Lock is designed specifically for electrical component interlocking.

F. Monitoring by Remote Computer:

1. Description: Communication module in unit control panel shall provide capability for remote monitoring of status, parameters, and alarms. The remote computer and the connecting signal wiring are not included in this Section. Include the following features:

   a. LON Mark compatible network interface units, or Approved Equal as approved by Resident Engineer.

   b. Software designed for control and monitoring of UPS functions and to provide on –screen explanations, interpretations, diagnosis, action guidance, and instructions for use of monitoring indications and development of meaningful reports. Permit storage and analysis of power-line transient records. Design for Microsoft Windows application in an IBM-compatible computer, which is not included in this Section.

G. Basic Battery Monitoring

1. Battery Ground-Fault Detector: Initiates visual and audible alarm when resistance to ground of positive or negative bus of battery is less than 5,000 ohms.

2. Battery compartment smoke/high-temperature detector initiates a visual and audible alarm when smoke or a temperature greater than 167 degrees F occurs within the compartment.

3. Annunciation of Alarms: At UPS control panel and at LCC.

4. An optional temperature sensor shall be available to monitor the ambient temperature internal to the battery cabinet. If the ambient temperature increases, the UPS system charger shall automatically reduce the charging voltage to a level recommended by the battery manufacturer. If the ambient temperature is decreased the UPS shall automatically increase the battery charge voltage to that recommended by the battery manufacturer.

2.05 MECHANICAL DESIGN

A. Enclosures: The UPS shall be housed in free-standing double front enclosures (safety shields behind doors) equipped with casters and leveling feet. The enclosures shall be designed for computer room applications. Front doors shall have locks to prevent unauthorized entry.

B. Ventilation: The UPS shall be designed for forced-air cooling. Air inlets shall be on the front of the unit. Air outlets shall be on the top. Eighteen inches of clearance over the UPS outlets shall be required for proper air circulation. Air filters shall be commonly available sizes.

C. No back or side clearance or access shall be required for the system. The back and side enclosure covers shall be capable of being located directly adjacent to a wall.

D. Cable entry: Standard cable entry for the UPS cabinet shall be through either the enclosure bottom or top. A dedicated wireway shall be provided within the UPS cabinet for routing user input and output wiring.

E. Front access: All serviceable subassemblies shall be modular and capable of being replaced from the front of the UPS (front access only required). Side or rear access for installation, service, repair or maintenance of the UPS system shall not be required.

F. Service area requirements: The system shall require no more than thirty-six (36) inches of front service access room and shall not require side or rear access for service or installation.

2.06 CONTROLS AND INDICATORS

A. Microprocessor controlled circuitry: The UPS controls shall have the following design and operating characteristics:

1. Fully automatic operation of the UPS shall be provided through the use of microprocessor controlled circuitry to provide consistent operational responses.

2. All operating and protection parameters shall be firmware controlled, thus eliminating a need for manual adjustments. The logic shall include system test capability to facilitate maintenance and troubleshooting. Printed circuit board replacement shall be possible without requiring calibration.

3. Start-up and transfers shall be automatic functions.

B. Digital Front Panel Display: The UPS control panel shall be a digital front panel display with a backlit LCD display. The LCD shall display UPS status, metering, battery status, alarm/event queue, active alarms and UPS configurations. The front panel display shall show a system mimic diagram with an outlined power path, current operating mode and event logs.

C. Control Panel Indicators: The UPS control panel shall provide the following monitoring functions with indicator LED’s:

1. NORMAL: This shall indicate that the commercial AC utility or generator source is supplying power to the rectifier and the inverter is supporting the critical load. A text message shall indicate if the bypass line is not within tolerance.

2. BYPASS: This shall indicate that the UPS has transferred the load to the bypass circuit.

3. BATTERY: This shall indicate that the commercial AC utility or generator source has failed and the battery is supplying power to the inverter, which is supporting the load. A text message shall indicate if the battery charge is low or if the battery is installed but disconnected.

4. ALARM: This shall indicate that the UPS detects an alarm condition, outlined in detail in the operator's manual.

D. Control Panel Controls: Per UL 924 standards, the control push buttons must be protected, preventing the push buttons from being actuated without the use of a "tool." The UPS control panel shall provide the following functions from front panel push buttons:

1. EVENTS: Displays the list of Active System Events and a historical log of system events. Historical logs shall include a detailed time stamped list of the latest 128 events.

2. METERS: Displays performance meters for the system or critical load. When selected, the front display shall show individual screens of input parameters, output parameters or bypass parameters including; voltage, current and frequency. In addition, the battery display shall show runtime remaining.

3. CONTROLS: Displays a System Controls screen. Allows selection of operating mode, normal, bypass, charger on/off and Power Module on/off.

4. SETUP: Allows display contrast, date and time information serial communication port configuration and display of firmware revision numbers.

5. RETURN: Confirms selection or returns to previous screen.

E. Interface panel: The UPS shall be equipped with an interface panel, located behind a protective cover, which provides the following signals and communication features in a Class 2 environment:

1. Alarm contact: A dry contact for annunciating a summary alarm shall be provided for customer use. This contact shall be Form "C" capable of supplying both N/O and N/C contacts. Contact ratings shall be 5A max at a voltage not to exceed 28VDC or 277VAC.

2. RS232 (EIA / TIA-232) communications interface: Circuitry shall be provided for one RS232 (EIA / TIA-232) communication port for connection to automated service department diagnostic tools. This port may be used with simple ("dumb") terminals to gain remote access to all unit operation information.

3. Building alarms: Two inputs shall be provided for monitoring the status of external dry contacts. Building alarms shall be set up through the UPS configuration mode function on the RS232 (EIA / TIA-232) port.

4. External EPO contacts: Shall be provided to connect an external remote emergency power off switch to shut down the UPS and de-energize the critical load.

5. Battery control contacts: Contacts shall be provided to connect the battery UVR and auxiliary signals from a battery breaker or battery disconnect switch.

6. External bypass indicator connection: A connection point shall be provided to acknowledge that an external maintenance bypass has been closed around the UPS, placing the critical load on utility power.

7. The system shall have options to add four (4) additional building alarms, 384 logged events, 4 additional languages, Mandarin or Russian as a primary language.

F. Manual Operable Test Switch:

1. Per UL 924 standards, the UPS shall be provided with an automatic load control switching device or manually operable test switch, or provisions for the connection of an external test switch, to simulate the conditions under which the load control switching device is intended to operate (such as loss of the normal supply).

2. For the purpose of meeting the requirement, the test switch is considered accessible only to authorized persons if it is mounted within an enclosure, or if it is of the key-operated type. If the test switch is mounted within an enclosure, the cover of the enclosure shall be hinged.

2.07 SOURCE QUALITY CONTROL

A. Factory test complete UPS, including battery, before shipment. Include the following tests:

1. Functional test and demonstration of all functions, controls, indicators, sensors, and protective devices.

2. Full-load test.

3. Transient-load response test.

4. Overload test.

5. Power failure test.

B. Observation of Test: Give 14 days' advance notice of test and provide opportunity for Resident Engineer to observe tests.

C. Report test results. Include the following data:

1. Description of input source and output loads used. Describe actions required to simulate source load variation and various operating conditions and malfunctions.

2. List of indications, parameter values, and system responses considered satisfactory for each test action. Include tabulation of actual observations during test.

D. List of instruments and equipment used in factory tests.

2.08 LOCAL RACK OR CABINET MOUNT UPS

A. Output:

1. Output Voltage Distortion: Maximum 5 percent at full load.

2. Output Frequency (Sync to Mains): 57-63 Hz

3. Cret Factor: Maximum 5:1.

4. Waveform Type: Sine Wave.

5. Output Connections: (6) NEMA 5-15R.

B. Input:

1. Nominal Input Voltage: 120 V.

2. Input Frequency: 50/60 Hz +/- 3 Hz (auto sensing).

3. Input Connections: NEMA 5-15P.

4. Cord Length: Minimum 8 feet (2.44 meters).

5. Input voltage range for main operations: 82-144 V.

6. Input voltage adjustable range for mains operation: 75-154 V.

C. Batteries:

1. Battery Type: Maintenance-free sealed Lead-Acid battery with suspended electrolyte: leak proof.

D. Communications and Management:

1. Interface Port(2): DB-9 RS-232, Smart Slot, USB.

2. Control Panel: LED status display with load and battery bar-graphs and On Line, On Battery, Replace Battery, and Overload Indicators.

3. Audible Alarms: Alar, when on battery, distinctive low battery alarm, configurable delays.

4. Emergency Power Off (EPO)

E. Surge Protection and Filtering:

1. Surge Energy Rating: 459 Joules.

2. Filtering: Full time multi=pole noise filtering: 0.3 percent IEEE surge let-through: zero clamping response time: meets UL 1449.

F. Environmental:

1. Operating Environment: Rated for the conditions where installed. For outdoor non-environmentally controlled locations: 0 – 140 degrees F.

2. Operating Relative Humidity: 0 – 95 percent .

3. Online Thermal Dissipation: 89.00 BTU/hr.

G. Conformance: Regulatory Approvals: FCC Part 15 Class A, UL 1778.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine elements and surfaces to receive equipment for compliance with installation tolerances and other conditions affecting performance, including, but not limited to, ambient temperature, cooling air circulation, contaminants and disassembly and maintenance space.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

C. Verify installation conditions are representative of the conditions used in the coordination study for the electrical system.

3.02 INSTALLATION

A. Maintain minimum clearances and workspace at equipment according to manufacturer’s written instructions and NFPA 70.

B. Connections: Interconnect system components. Make connections to supply and load circuits according to manufacturer’s wiring diagrams, unless otherwise indicated.

C. Grounding:

1. Comply with project specifications and NFPA 70 for grounding and bonding requirements for Separately Derived Systems.

D. Identification:

1. Identify components and wiring.

2. Equipment shall be labeled “Suitable for use on emergency systems” in accordance with NEC 700-3.

3. Instructional signs: Install approved legend where instructions or explanations are required for system of equipment operation.

E. Battery Equalization:

1. Equalize charging of battery cells according to manufacturer’s written instructions. Record individual-cell voltages.

3.03 FIELD QUALITY CONTROL

A. Manufacturer’s Field Service: Engage the services of a factory-authorized service representative to supervise UPS installation, startup, and preliminary testing and adjustment and to participate in final tests, inspections, and adjustments.

B. Electrical Tests and Inspections: Perform tests and inspections according to manufacturer’s written instructions and as listed below to demonstrate condition and performance of each component of the UPS:

1. Inspect interiors of enclosures, including the following:
    a. Integrity of mechanical and electrical connections.
    b. Component type and labeling verification.
    c. Ratings of installed components.
2. Test manual and automatic operational features and system protective and alarm functions.
3. Test communication of status and alarms to remote monitoring equipment.
4. Load the system using a variable-load bank to simulate kilovolt amperes, kilowatts, and power factor of loads for the unit's rating. Use instruments calibrated, within the previous 6 months according to National Institute of Standards and Technology (NIST) standards:
    a. Simulate malfunctions to verify protective device operation.
    b. Test duration of supply on emergency, low-battery voltage shutdown, and transfers and restoration due to normal source failure.
    c. Test harmonic content of input and output current less than 25, 50, and 100 percent of rated loads.
    d. Test output voltage under specified transient-load conditions.
    e. Test efficiency at 50, 75, and 100 percent rated loads.
    f. Test remote status and alarm panel functions.
    g. Test battery-monitoring system functions.
    h. Test resistance to ground of battery negative pole.

C. Seismic-restraint inspections shall include the following:
1. Inspect type, size, quantity, arrangement, and proper installation of mounting or anchorage devices.
2. Test mounting and anchorage devices.
3. Verify batteries are properly mounted and secured to battery racks.

D. Correct deficiencies until specified requirements are met.

E. Record of Inspections: Maintain and submit documentation of inspections, including references to manufacturers written instructions and inspection criteria. Include results of inspections.

3.04 CONSTRUCTION

A. Sequence of Operations:
1. Automatic operation includes the following:

a. Normal Conditions: Supply the load with ac power flowing from the normal ac power input terminals, through the rectifier-charger and inverter, with the battery connected in parallel with the rectifier-charger output.

b. Abnormal Supply Conditions: If normal ac supply deviates from specified and adjustable voltage, voltage waveform, or frequency limits, the battery supplies energy to maintain constant, regulated inverter ac power output to the load without switching or disturbance.

c. If normal power fails, energy supplied by the battery through the inverter continues to supply-regulated ac power to the load without switching or disturbance.

d. When power is restored at the normal supply terminals of the system, controls automatically synchronize the inverter with the external source before transferring the load. The rectifier-charger then supplies power to the load through the inverter and simultaneously recharges the battery.

e. If battery becomes discharged and normal supply is available, the rectifier-charger charges the battery. On reaching full charge, the rectifier-charger automatically shifts to a float-charge mode.

f. If any element of the UPS system fails and power is available at the normal supply terminals of the system, the static bypass transfer switch switches the load to the normal ac supply circuit without disturbance or interruption of supply.

g. If a fault occurs in the system supplied by the UPS and current flows in excess of the overload rating of the UPS system, the static bypass transfer switch operates to bypass the fault current to the normal ac supply circuit for fault clearing.

h. When the fault has cleared, the static bypass transfer switch returns the load to the UPS system.

i. If battery is disconnected, the UPS continues to supply power to the load with no degradation of its regulation of voltage and frequency of the output bus.

2. Manual operation includes the following:

a. Turning the inverter off causes the load to be transferred by the static bypass transfer switch directly to the normal ac supply circuit without disturbance or interruption.

b. Turning the inverter on causes the static bypass transfer switch to transfer the load to the inverter.

3. Maintenance Bypass/Isolation Switch Operation: Switch is interlocked so it cannot be operated unless static bypass transfer switch is in the bypass mode. Device provides manual selection between the following three conditions without interrupting supply to the load during switching:

a. Full Isolation: Load is supplied, bypassing the UPS. Normal UPS ac input circuit, static bypass transfer switch, and UPS load terminals are completely disconnected from external circuits.

b. Maintenance Bypass: Load is supplied, bypassing the UPS. UPS ac supply terminals are energized to permit operational checking, but system load terminals are isolated from the load.

c. Normal: Normal UPS ac supply terminals are energized and the load is supplied through either the static bypass transfer switch and UPS rectifier-charger and inverter, or the battery and the inverter.

3.05 DEMONSTRATION

A. Engage a factory-authorized service representative to train Sound Transit maintenance personnel to adjust, operate, and maintain the UPS.

B. Train Sound Transit maintenance personnel in the procedures and schedules for starting and stopping, troubleshooting, servicing, and maintaining equipment.

C. Review data in maintenance manuals. Refer to Section 01 78 23 - Operation and Maintenance Data.

D. Schedule training with Resident Engineer with at least 7 days advance notice.

E. Monitoring and Testing Schedule: Perform monitoring and testing in a single 10-day period:

1. Schedule monitoring and testing activity with Resident Engineer. Provide at least 7 days advance notice.

2. Schedule monitoring and testing after Substantial Completion when UPS is supplying power to its intended load.

F. Monitoring and Testing Instruments: Three-phase, recording power monitors. Instruments shall provide continuous simultaneous monitoring of electrical parameters at input terminals of the UPS and at input terminals of a load served by the UPS. Instruments shall monitor, measure, and graph voltage current and frequency simultaneously and provide full-graphic recordings of the values of those parameters before and during power line disturbances that cause the values to deviate from normal beyond the adjustable threshold values. Instruments shall be capable of recording either on paper or on magnetic media and have a minimum accuracy of plus or minus 2 percent for electrical parameters. Parameters to be monitored include the following:

1. Current: Each phase and neutral and grounding conductors.

2. Voltage: Phase to phase, phase to neutral, phase to ground, and neutral to ground.

3. Frequency transients.

4. Voltage swells and sags.

5. Voltage impulses, phase-to-phase, phase-to-neutral, phase-to-ground, and neutral-to- ground.

6. High-frequency noise.

7. Radio-frequency interference.

8. THD of the above currents and voltages.

9. Harmonic content of currents and voltages above.

G. Monitoring and Testing Procedure:

1. Exploratory Period: For approximately the first 2 days, make recordings at various circuit locations and with various parameter-threshold and sampling-interval settings. Make these preliminary measurements with the objective of identifying optimum UPS, power system, load, and instrumentation set-up conditions for subsequent test and monitoring operations.

2. Remainder of Test Period: Perform continuous monitoring of at least two circuit locations selected on the basis of data obtained during exploratory period.

a. Set thresholds and sampling intervals for recording data at values selected to optimize data on performance of the UPS with respect to values specified in PART 2 – PRODUCTS of this Section, and to highlight any need to adjust, repair, or modify the UPS or any distribution system or load component that may influence its performance or that may require better power quality.

b. Perform load and UPS power source switching and operate the UPS on generator power during portions of the test period.

c. Operate the UPS and UPS loads in each mode of operation permitted by UPS controls and by the power distribution system design.

d. Create and simulate unusual operating conditions, including outages, voltage swells and sags, and voltage, current, and frequency transients that can be performed using loads and devices available as part of the facility's installed systems and equipment. Maintain normal operating loads in operation on system to maximum extent possible during tests.

e. Make adjustments and repairs to UPS, distribution, and load equipment to correct deficiencies disclosed by monitoring and testing and repeat appropriate monitoring and testing to verify success of corrective action.

H. Correlation with Specified UPS Monitoring Functions: Obtain printout recordings of built-in monitoring functions specified for UPS and UPS components in this Section that are simultaneous with those made with portable instruments in this Article.

1. Provide the temporary use of an appropriate personal computer and printer equipped with required connections and software for recording and printing if such units are not available on-site.

2. Correlate printouts with recordings for monitoring performed according to this Article; resolve and report anomalies in and discrepancies between the two sets of records.

I. Documentation: Record test point and sensor locations, instrument settings, and circuit and load conditions for each monitoring summary and power disturbance recording. Correlate simultaneous recordings made on UPS input and load circuits.

J. Analysis of Recorded Data and Report: Review and analyze test observations and recorded data and submit a detailed written report. Include the following in final report:

1. Description of corrective actions performed during monitoring and survey work and their results.
2. Recommendations for further action to provide optimum performance by the UPS.
3. Copies of monitoring summary graphics and graphics illustrating harmonic content of significant voltages and currents.
4. Copies of graphics of power disturbance recordings that illustrate findings, conclusions, and recommendations.
5. Recommendations for operating, adjusting, or revising UPS controls.
6. Recommendation for alterations to the UPS installation.
7. Recommendation for adjusting or revising generator-set or automatic transfer switch installations or their controls.
8. Recommendations for power distribution system revisions.
9. Recommendations for adjusting or revising electrical loads, or their connections or controls.

K. Interim and Final Reports: Provide an interim report at the end of each test period and final comprehensive report at the end of the final test and analysis period.

END OF SECTION

SECTION 26 42 55

TRACK RESISTANCE TESTING

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Requirements for testing trackwork to determine the track-to-earth resistance values and rail-to-rail resistance values of the running rails.

B. The procedures presented in this Section are general guidelines for the measurement of track-to-earth resistance and rail-to-rail resistance as construction progresses. These procedures shall be modified to suit actual field conditions and the electrical networks established by the trackwork that results from continuing construction.

C. The Contractor shall perform the testing set forth in this Section. It is the Contractor's responsibility to construct trackwork that meets the established criteria. Repair or replace any trackwork found deficient at the Contractor's expense with no additional costs to Sound Transit.

1.02 REFERENCES

A. This Section incorporates by reference the latest revisions of the following documents:

1. ASTM International (ASTM).

a. ASTM G165 Standard Practice for Determining Rail-to-Earth Resistance.

1.03 SUBMITTALS

A. Submit:

1. Testing Agency Qualifications:

a. Testing firm qualifications, including resumes and certifications for all testing personnel and supervisors.

2. Testing Plan:

a. The test plan including the schedule for work, procedures, testing forms, test methods, acceptance criteria, and equipment to be used.

3. Test Reports:

a. All trackwork isolation testing data, records, calculations, results, and reports. Test submittals shall include sufficient information so that the results are identifiable and traceable to installed components or locations.

1.04 QUALITY ASSURANCE

A. The Contractor shall employ an independent corrosion control firm to supervise installation and to perform all installation testing of the trackwork isolation system including, but not limited to, high voltage testing of rail boot material, pre-installation inspection, post installation testing of the track-to-earth resistance, post installation testing of the rail-to-rail resistance, and post installation testing of the insulating rail joints. The independent corrosion control firm shall have been continuously engaged in the field of corrosion control testing related to DC electrified transit systems for a minimum of five years and shall have the following qualifications:

1. Registered professional corrosion engineer or NACE International Certified Cathodic Protection Specialist available to manage this corrosion control project.

2. NACE International certified Cathodic Protection Specialists and Corrosion Technicians available to perform the required field-testing.

3. A minimum of five years' experience in the testing of trackwork isolation of similar type and equal complexity as the system specified and indicated.

4. Testing shall be performed by personnel with at least five years of employment experience with testing trackwork isolation systems.

5. All equipment to be used for quality assurance testing shall bear current calibration stickers. Current calibration certificates shall be submitted for all equipment to be used for this testing.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.01 CONTRACT HOLD POINTS

A. Install a test section of not more than 2,000 feet of trackwork. Subsequent to the installation of the test section and prior to connection to existing trackwork, the Contractor's Testing Agency shall perform track-to-earth and rail-to-rail resistance testing to ensure that the criteria set forth in Article 3.02, herein, are met. The Contractor shall replace or repair any trackwork found to be deficient at no additional expense to Sound Transit. Do not construct any additional track construction until the test section is accepted by the Contractor's Quality Manager and by Sound Transit to meet the established criteria.

B. Submit weekly schedule updates indicating the track that has been installed to date and the trackwork scheduled to be installed during the upcoming week such that a testing schedule can be established by the Contractor.

C. It is the Contractor's responsibility to clean all sections scheduled for testing of all dirt, debris, and water prior to each scheduled test. Cost of cleaning and retesting any test section found to be in unacceptable condition shall be borne by the Contractor.

3.02 TEST PROCEDURE

A. Track-to-earth and rail-to-rail resistance testing shall be performed by the Contractor. The Contractor has the option to utilize the test procedure set forth below should the Contractor choose to perform preliminary track-to-earth resistance proof-testing prior to the quality control testing. The following general test procedure are to be followed by the Contractor:

1. Take a sufficient number of readings to ensure that human error in reading the instruments and transient disturbances in the electrical network have negligible influence on the final results.

2. Obtain a minimum of three (3) measurements for each data type test.

3. Record time at which each reading is obtained.

4. Examine data at time of test to ascertain that removal of either the highest or lowest value will not alter the arithmetic average of the group by more than 5 percent. If the average will be altered by more than 5 percent, obtain additional sets of data and combine results with first set. If the average of the combined data will still be altered by more than 5 percent by removal of the highest or lowest value, an unstable condition might exist. Advise the Contractor's Quality Manager and the Resident Engineer of unstable data conditions.

5. Perform incremental track-to-earth resistance and rail-to-rail resistance tests as soon as all major construction work is completed for that track increment. Do not defer testing to consolidate the testing effort.

6. Perform track-to-earth resistance and rail-to-rail resistance tests for all trackwork, including special trackwork areas, after track installation is completed.

7. Prior to each test, visually examine trackwork to ensure that there is no debris, water, dirt, ballast or other conductive material in electrical contact with the track. Record the condition of the track section to be tested on the data sheet.

B. Electrical Test Procedures:

1. The purpose of this Article is to identify minimum electrical test requirements for track-to-earth and rail-to-rail resistance measurements. Conduct tests in accordance with the approved test plan.

2. Rail Insulating Joint Test. Test each rail insulating joint for effectiveness prior to the connection of impedance bonds by both of the following test methods:

   a. Measure the resistance between each side of the insulating joint and the joint bar and measure the resistance across the insulating joint.

   b. Measure the voltage shift of the rail to earth on both sides of the insulating joint while applying a test current to one side of the insulating joint during track-to-earth resistance testing. Measure the voltage shift across the insulating joint as well.

   c. Repair and retesting of any deficiencies are at the Contractor's expense.

   d. Document all measurements and submit in accordance with approved test plan.

3. Track-to-Earth Resistance Test. Conduct track-to-earth resistance testing for all trackwork constructed for this project. Two test methods can be utilized for this contract to obtain the required track-to-earth resistance depending on the trackwork configuration encountered during the test period. Test sections of trackwork in maximum increments of 2,000 track feet:

   a. Track-to-earth resistance Test Method 1 pertains to electrically separated sections of trackwork. Conduct this test in accordance with ASTM G165.

   b. Track-to-earth resistance Test Method 2 pertains to electrically interconnected sections of trackwork. Conduct this testing in accordance with ASTM G165 for equipment and measurement requirements and with the following:

      1) Establish a current circuit (I1) between the track system and a low resistant earth contact and a track-to-earth voltage measuring

circuit (Vg1) using a low resistance earth contact. Do not use the same earth contact for voltage circuit and the current circuit.

2) With the current circuit (I1) closed, reduce the meter ranges of both circuits until the lowest readable scales are reached. Read and record the "on" values for current and voltage.

3) Open the current circuit (I1) and immediately read and record the "off" values for current and voltage. Repeat a minimum of three (3) times for accuracy.

4) Calculate the effective track-to-earth resistance by dividing the summation of change in voltage ΣΔVg1, by the summation of change in current, ΣΔI1:

Rvg1-1 = ΣΔVg1/ΣΔI1 (volt/ampere)

This resistance value represents the apparent resistance of the track section under test in parallel with the adjacent track sections. Usually the composite resistance to earth of the adjacent track sections will be lower than that of the test section because of the greater amount of trackage involved.

5) Obtain additional track-to-earth couplings at other locations as required.
